In the year 1788, an event took place at Dundee, which excited a great sensation all over Scotland. On the night of the 16th of February, the office of the Dundee Banking Company was broken into, and robbed of the sum of L.422, 2s. 6d. It was discovered that the robbery had been effected by means of a hole made in the ceiling, through which the plunderers had effected their entrance and escape. The interests of so wide a circle of persons are involved in the security of a bank, that it was natural for such an occurrence to create much stir and alarm, though the sum stolen was comparatively small. Accordingly, a reward of one hundred and fifty pounds was immediately offered for information respecting the offenders, part of the sum to be paid on conviction. For some time no discovery was made, but at length a person named Alexander Macdonald, tailor in Dundee, came forward and gave information, implicating three individuals, James Falconer and Peter Bruce, merchants in Dundee, and James Dick, late shipmaster there, in the affair of the bank robbery.

On Wednesday the 13th of August, the trial of Falconer and Bruce took place in the Edinburgh Justiciary Court, before Lord Hailes and other judges. Dick had left Dundee before the charge was made against him, and appears to have been out of the way during the whole progress of the business. When Macdonald was brought forward for examination, the leading counsel for the panels offered some objections to his testimony. The counsel declared himself able to prove that Macdonald was a person of bad general character; that he had once stolen a bill; that he had personated an exciseman, and had made a seizure of tea under that character; besides being guilty of several other illegal acts. But the judges held that a conviction and sentence in a proper court were the only circumstances that could justify the rejection of a party's evidence in a criminal cause. Accordingly, as Macdonald had never been so tried and convicted, he was allowed to give evidence, although, in addition to the preceding objections, it was also proved that he had *claimed the reward* offered in the case now under examination; a circumstance which he himself had previously denied to the court in the most positive terms.

Macdonald deposed that, eight months before the commission of the crime, he had been requested by Falconer, Bruce, and Dick, to join them in a plan for robbing the bank, and had been repeatedly spoken to about the same scheme afterwards, being at the same time bound to secrecy by a terrible oath. Two other persons were concerned, according to the witness, with the three mentioned; but either these men were out of the way, or the court appears to have permitted him to keep the names of these parties to himself. Macdonald then proceeded to state, that Falconer and his companions had called upon him late on the Saturday night on which the bank was robbed, and desired him, with threats, to rise out of bed and follow them to the bank. They left him, and he rose and dressed himself. On going into the street, he met two women, Anne Valentine and one Menzies, the former of whom was seeking a boy, her son. With these women he went towards the town-house, which is above the bank, the hall of the town-house being separate from the bank office only by a single floor and ceiling in one part. In the Guildhall he saw the glimmer of a light, and conjectured that the plunderers had made their way into it. He and his companions went up the town-hall steps, and there, on looking through the key-hole, they saw Falconer with his coat off, and Bruce and the others engaged in fastening a rope around his waist, for the purpose of letting him down through a hole which they had made. Macdonald saw Falconer let down, after which he and those with him left the town-hall steps, and went back to the street. They remained there till the five plunderers came out, and were seen by them. This took place about one on the Sunday morning.

This was Macdonald's evidence, and it was corroborated by the women Valentine and Menzies, as respected the seeing of the pannels on the street, and in the town-hall.

This was the whole evidence against Falconer and Bruce. The counter-testimony was of various kinds. The accused were persons of respectable station and character; their accusers were *not*. A living friend of Bruce, who was his schoolfellow and intimate friend, declares to us that no one who knew him believed for a moment in his guilt. Again, each of the prisoners brought witnesses to prove an alibi, and these witnesses were of respectable character; but unfortunately their testimony did not bear upon the precise hour at which the robbery was committed. Three witnesses saw Falconer in his own house between ten and eleven, and the latest visitor saw him in *bed*, complaining of illness. Three witnesses deposed also to Bruce being at home late on Saturday night; one person heard him reading at *twelve o'clock* at night. Moreover, the counsel for the prisoners declared that it was *impossible* for Macdonald and the women to have seen the hole through which the robbers had descended into the bank, from their position at the town-hall door. Strange to say, this point, which would have utterly subverted the whole criminatory evidence, does not appear to have been thoroughly examined into.

Notwithstanding the bad character of Macdonald, the main witness, and the strong points in favour of the accused, Lord Hailes, the presiding judge, summed up against them, and the jury gave a verdict of guilty, by a plurality of voices. The prisoners were condemned to death; yet, as the jury were divided on the case, so do the highest authorities of the land appear to have been. The unfortunate men were respited two different times. At their trial, as well as during the whole of their confinement, they uniformly denied their accession to the robbery, and all knowledge of any intention to perpetrate it. They were at last executed at Edinburgh on the 24th of December 1788. "Their behaviour on the scaffold (says the Scots Magazine of the day) was devout, serious, and becoming; and in their last address they implored that mercy and forgiveness might be extended to those unhappy persons by whose testimony they had been thus untimely cut off. It is hoped that time, which unveils the dark and hidden doings of the most artful, will yet reveal to the public the whole history of this mysterious affair."

Little more than a year after the execution of these unfortunate men, who died in the prime of life, a cause was brought before the Court of Session, in which Alexander Macdonald, Alexander Menzies, and Anne Kermack, were the parties on one side, while the heirs of William Bruce, late shipmaster in Dundee (and either father or uncle to the executed Peter Bruce), were implicated on the other side. Macdonald had instituted a process for the recovery of L.284, for which he held a bill purporting to have been granted by William Bruce. The result of the trial was, that Macdonald was found guilty of a gross fraud in obtaining the bill, and his witnesses and accomplices convicted of direct perjury. Macdonald was sentenced to be transported beyond seas for fourteen years, expelled from Scotland for life, and declared infamous. Menzies received the same sentence, with this difference, that his transmarine exile was for seven years; and in sentencing him, the Lord President declared him to be a "most infamous man, dangerous to society, and one who feared neither God nor man." The

Digitized by Google

woman received a sentence more lenient, but was also declared infamous, according to the forms of law of the day.

The exposure of this conspiracy excited a dire suspicion in the public mind. The name of Mensies will be remembered as having been that of one of the evidences against Falconer and Bruce. In short, there appeared too much reason to fear that Macdonald had induced a band of confederates to perjure themselves on both occasions. The public thought so; for, in sentencing the man, Lord Henderland said, that, "had it not been for the peculiar situation of the pannel, he should have proposed that a public whipping be added to the punishment; but he feared the rage of an incensed populace would prove fatal to the prisoner." The Lord President also remarked, that "from what had appeared in this bill affair, there was room for a melancholy doubt whether all was right with respect to a late trial, but that he would leave this to God and the prisoner's own conscience." Macdonald, who is described as a man evidently "possessing superior talents," and as having spoken for himself at the bill-trial with "an energy and address worthy of a better cause," had the hardihood to stand up and answer the Lord President's hint, by solemnly asseverating that Falconer and Bruce were really guilty of the robbery of the Dundee Bank. He also made an appeal against the sentence of banishment, which produced no effect.

Although a great portion of the public was now firmly persuaded of the innocence of Falconer and Bruce, believing from Macdonald's audacity in bringing a fraudulent claim against the aged relative of Peter Bruce that he was a man capable of any villany, yet a mystery hung over the subject to a certain extent. However, in the middle of the year 1790, two years after the execution of Falconer and Bruce, an extraordinary sensation was caused in Edinburgh by the commission of a number of mysterious robberies, the author or authors of which contrived to evade the vigilance of the authorities. These robberies followed each other in quick succession. For example, William Proctor, grave-digger, was knocked down and robbed, at the back of the Castle, on the night of July the 31st. Thomas Elliott, tacksman of Heriot House toll, was knocked down and robbed at the Sciennes, on the night of August the 2d. James Logan was knocked down and robbed of a gold watch on the Earthen Mound, on the night of August the 4th. Within the same five days alone, a housebreaking and another robbery took place. From descriptions and other circumstances, the criminal authorities were led to believe these acts, with many others, to have been committed by one daring and active man. But all their exertions were inefficient in tracking the guilty party. At length suspicion fell upon a soldier in the Castle. Inquiry and a trial followed, when it was discovered that this soldier, William Gadesby, then only twenty-eight years of age, had not only committed the series of robberies which had attracted so much attention, but had carried on a similar course, with almost unexampled success and daring, from the age of fourteen upwards. Since his enlisting, he had contrived to leave the Castle repeatedly by night: he mentioned at his trial that hackney-coaches, going in and out at late hours from the officers' barracks, afforded him his usual means of passage. This singular malefactor, whose exploits also form a theme of remark in fireside tales in Scotland, was sentenced to die on the scaffold, on the 20th of February 1791.

Amongst his greatest crimes, though not one of those for which he suffered, must be reckoned that of his having allowed two innocent men to go to the scaffold for a crime not their own, but his. Such was the case. William Gadesby was the robber of the Dundee Bank. The wretch Macdonald, and the women who supported his evidence, had been actuated by the miserable desire to possess the stipulated reward, and had burdened their souls with the heavy crime of perjury in order to accomplish that object. Speaking of the execution of Gadesby, the Annual Register for 1791 states, "With his last breath he declared Falconer and Bruce, who were executed here two years ago for robbing the Dundee Bank, to be innocent of that crime, and acknowledged his own guilt!" The deed had been committed by him before entering the army.

It is impossible to read the case of Falconer and Bruce in the present day, without an indignant sense of the mercilessness with which the laws were administered fifty years ago in Scotland. Here, upon manifestly bad and insufficient evidence, two men of good repute were put to an ignominious death, for a crime which, even had they been guilty of it, would have been far too dearly expiated by the sacrifice of two lives. It was atrocious in the first place to condemn on such evidence, and doubly atrocious in the second place to execute two men for such a crime. Judges sincerely anxious to do justice might have been expected to take some pains to sift and test the evidence, particularly by the obvious expedient of ascertaining if it was possible, from the Guildhall door, to have seen the robbers descend into the bank. None of the ordinary records of such events hint at such an inquiry having been made. And, considering the dubiety of the case, the supreme authority might have been expected to commute the punishment. But all persons in those days entrusted with the administration of the laws, from royalty itself downwards, were hurried away by an insane anxiety to punish. Life was held as light in the balance against the most trifling article of property; and servile juries were found to yield to the dictates of judges in whatever they were pleased to command. We may surely congratulate ourselves on the better spirit which has since dawned on all these parties, and the superior value which is now put on human life—invariably one of the clearest marks of an advanced civilisation.

PAINTING UPON GLASS.

GLASS-PAINTING is understood to have had its origin in the third century, and in the eighth and tenth centuries we have clear proofs of its having been used for the decoration of church windows. But it was not till the fourteenth century that the manner of fixing colours in glass, or enamelling, was discovered. This was a most important addition to the resources of the art, and from the period of its discovery, glass-painting began more especially to flourish. In the fifteenth and sixteenth centuries, it reached its acme, and a prodigious quantity of coloured glass resulted from the labours of that age. Great painters gave their aid in the ornamenting of churches in this way. In Germany, Albert Durer thus gained great celebrity. France and the Netherlands abounded in artists who devoted themselves to the same task. England, also, was visited by Bernhard de Linge, a Fleming, in the reign of James I., and by him a school was there founded, which continued the exercise of the art for many years afterwards. But the taste for thus decorating churches declined soon after, and in the eighteenth century, glass-painting fell altogether into decay. It has, however, been revived on the continent in the nineteenth century. M. St Frank of Nuremberg has recently attained to a great distinction as a painter on glass at the royal porcelain manufactory of Munich. In France, still more recently (within these five years), M. Thibaut and M. Thevenot have revived glass-painting at the manufactory of Clermont, and have executed some works that will bear comparison with aught produced in past times. The chapel of Notre-Dame de Beaume has been enriched by M. Thibaut with beautiful paintings of this order, and he has produced two other great pieces, an Annunciation of the Virgin, and a representation of Anne of Bourbon at her devotions. The cathedral of Metz, too, has been recently adorned by some exquisite glass-paintings of the Virgin and others. In France, in short, the art has experienced a complete resuscitation. The government has lent its patronage, able artists are directing themselves to the subject, and at all the late exhibitions of art, specimens have been exposed that have attracted great attention. We may expect soon to learn that all the great buildings of the country are beautified by this art, the products of which have a superlatively rich and attractive effect.

It may be imagined by some that the art of glass-painting is neither of sufficient importance, nor of sufficient difficulty, to call for such observations. But the case is otherwise. We have had an opportunity of witnessing the process in this country, and hearing its details explained, and can readily perceive that the execution of a great work of this order must be a thing of no easy accomplishment. Certain metallic oxides and other mineral preparations, chiefly of the precious metals, are the substances constituting the paints or colours. Soft glass is the material operated upon, crown glass being too hard for the purpose. The glass-painter, besides being provided with a colour shop, has a large oven in his work-place, above the furnace of which are large shelves of iron, such as are used in stereotyping. The purpose of this is to receive the glass when made ready in the following manner: The workman having chosen his colours, and mixed up the materials as in ordinary water-colour painting, spreads the compost over the glass with a fine brush (supposing that this is all to be painted of one colour), and takes great care to divide and disseminate the paint accurately and nicely. The plate of glass is then introduced into one of the oven shelves, and there exposed for a time to a strong heat. The pores of the glass are to a certain extent opened, and the metallic pigment becomes incorporated with the body of it, without destroying the form, transparency, or polish. The glass, on being taken out, cooled, and cleaned, is found to have acquired the tint of the pigment. If the substance, however, has been spread unequally, one part will be more deeply tinted than another, and the heat, also, must be regulated carefully by experience, otherwise the glass will be more or less fused, and its form and texture destroyed. The painter can destroy the smooth surface of the glass when he chooses, and this is done in *obscuring* glass, as it is called, by the use of a white mineral pigment. This is spread as before, and after the glass is properly heated, it comes from the oven with the surface rough, precisely as if it had been ground like the common obscured glass of an argand burner.

This is certainly an easy process, where a plate of glass is simply to be tinted of a single colour. But matters are altered when figures of many hues are to be intermingled, or, in other words, where a fancy painting is to be put upon one glass. Here, in the first place, is to be exercised all the skill of the common pictorial artist, as well in designing as in colouring, and this has to be accomplished, moreover, with limited means, seeing that certain paints only can be used in the process; while, in the second place, extraordinary care is demanded for the regulation of the heating process. The practice of glass-painters is not to design with the pencil, though this might be done, but to cover their ground with the colours, and outline the desired figures by scraping out the rest with a knife.

It may now be readily conceived how great will be the difficulty of executing a great painting in this manner. Such figures as diamonds, hearts, and the common ornamental designs of windows, are done with considerable ease, where the coloured part consists of a single uniform tint. But though designs including human figures and dresses are much more difficult, they are, generally speaking, well worth the trouble they cost, their effect being so rich and beautiful.

By the inferior modes of glass-painting, which consist simply of laying on the colours on the back of the glass in a cold state, as in ordinary canvass-painting, beautiful works of art have also been produced. The different styles may be mingled to a certain extent, and indeed frequently are. In Edinburgh there are but two mercantile houses, we believe, which carry on the mode of enamel-painting just described, and in these many very beautiful pieces have been produced; but their operations are conducted on a comparatively small scale, there being no demand at present for great pieces for the decoration of public edifices in this country.

CURE OF SQUINTING.

WE extract from the British and Foreign Medical Review, the following account of cures of congenital squinting performed by Professor Diffenbach, of Berlin. The reviewer quotes from the *Medicinische Zeitung* for November 13, 1839, and February 5 and 12, 1840.

"The following cases are masterpieces from the hand of a master. The operation is beautiful in its simplicity, and the result delightful to contemplate. Who shall set bounds to the progress of surgery? These operations are the first of the kind ever performed on the living subject; but Stromeyer has the merit of having suggested the operation, and he performed it on the dead body, with a direct view to proving its practicability on the living.

'CASE I.—The subject of this operation was a child seven years old, whose eye was drawn far into the inner angle of the eyelids, so as to produce considerable disfigurement. The operation was performed in the following manner:—The head of the child was held against the chest of one assistant, while another with two hooks kept the eyelids widely apart. The operator then passed a third hook, which he gave to a third assistant to hold, through the conjunctiva, and to some depth in the subjacent cellular tissue at the internal canthus. He next fixed a fine double hook in the sclerotica at the inner angle, and, taking it in his left hand, drew the eye outwards. Then cutting into the conjunctiva close to the ball, where it is continued from it to the internal canthus, and penetrating more deeply by separating the cellular tissue by the side of the sclerotica, he divided the internal rectus muscle, close to its insertion, with a fine pair of scissors. The eye was immediately drawn outwards by the external rectus, as if it had received an electric shock; and in another instant became straight, so that there was no difference perceptible between its direction and that of the other eye.

The hemorrhage during the operation was but slight, though sufficient to impede it. The after-treatment consisted of cold lotions; no inflammation ensued, and within eight days the cure was completed.

CASE II.—Carl Gerhard, aged ten, affected with squint since his fourth year. His parents wishing him to become a printer, were anxious to have this defect removed, as it interfered with composing. The right eye was so completely drawn into the inner angle, that on a first view the point of junction of the iris and sclerotica formed the centre of the anterior surface of the eyeball. By an effort the eye could be drawn from the canthus and placed straight, but could not be turned at all outwards. The operation was performed as in the last case, the conjunctiva being cut through, and the sclerotica laid bare to the extent of four lines, in order to bring the muscle into view, which was cut with a curved scissors as before. The squint was gone; the eyeball, when at rest, stood nearly straight, or rather a little turned outwards, and could be turned more readily by the patient's efforts in this direction than inwards. All the other movements of the eye were free. The bleeding was here much less than in the former case, and caused no interruption. The sudden turning of the eyeball outwards, observed in the first case, did not take place here.

The boy felt quite well on the following day. He could separate the eyelids without difficulty. The conjunctiva in the inner angle of the eye was red. The eye was nearly straight, only turned a little more outwards than the other. In eight days the cure was complete, and the eye quite straight.

CASE III.—Albert Victor, aged fifteen, affected with strabismus of the left eye since his earliest infancy. The eyeball was turned deeply into the inner angle, but by an effort of the will it could be turned straight; but on this effort being relaxed, it instantly returned to the former position. The operation was performed precisely in the same manner, it being only here specified that the external incision in the conjunctiva was semilunar, and that the muscle was cut by introducing the pointed blade of the scissors beneath it. As soon as the hook that held the eye was removed, the ball turned at first outwards, but in a moment returned to the straight position. The edges of the wound did not gape, so that the external incision was barely perceptible. The eye was covered with a cold poultice, and the patient subjected to the antiphlogistic regimen. In eight days the cure was complete, and the squint entirely gone.'"

ARITHMETICAL PUZZLES.

THE following arithmetical puzzles are from the delightful children's book, "Philosophy in Sport Made Science in Earnest,"* of which a new edition in the cheapened form of one volume has been submitted to our attention by the publishers. We gladly do what is in our power to make known a book in which the effort to convey science under the attraction of a dramatic form, has certainly been made with rare skill and success.

"The next booth in the fair into which our party entered was that of Crank Smirky, the celebrated conjuror, who invited the company to witness his wonderful display of the art of legerdemain: he was dressed as an astrologer, with a loose gown of green velvet, and a red cap; he had a long grey beard, and his nose was bestraddled by a pair of green spectacles.

'Ladies and gentlemen,' said the mystic professor, 'I shall have the honour of convincing you this day, that my single hand is more than a match for all the sharp eyes of Overton. You will admit that a beautiful eye makes silence eloquent—a kind eye, contradiction an assent—and an enraged eye, beauty deformed; out my hand shall, by its magic influence, make eloquence dumb, assent a contradiction, and deformity beautiful.'

So saying, the professor beckoned a villager, who sat near the stage, to approach and assist him in the performance of his first grand trick.

'Dobby,' exclaimed his terrified wife, 'sit thee still; that man has dealings with the old one; I would not that he should touch your garment for all the gingerbread in the fair.'

This exclamation of the terrified wife set the whole audience in a roar, and produced a confusion which the skilful conjuror is always anxious to create, when any sly work is to be performed. In truth, this scene had been previously concerted by the renowned Crank Smirky, who had engaged this said Dobby as his confederate. A series of very amusing tricks were then performed with cards and counters; such, for instance, as desiring some person to draw a card from the pack, and having observed what it was, to return it; which card, to the wonder of the company, was immediately found in Dobby's pocket. Mr Seymour informed his children that the explanation of this trick would serve to show the manner in which most of the deceptions by cards were performed. He said, that the conjuror's pack of cards always contained a card, technically termed a '*brief* card,' or 'the *old gentleman*,' which is one made on purpose by the cardmaker, and is a little larger than any of the rest; the performer always knows it by feeling it, and can easily force it upon the unsuspecting drawer; should he, however, attempt to take any other, the conjuror, under some pretence, shuffles again, till at length he induces him to take the one intended for him. After the card has been introduced again into the pack, the performer, without any difficulty, withdraws it, and the confederate is called upon to produce the duplicate which had been previously placed in his pocket.

The children were told that the several deceptions with coin, or counters, which they had witnessed, were accomplished by a species of dexterity acquired only by practice, and termed '*palming*;' it consisted in being able to retain a shilling, halfpenny, or counter, in the palm of the hand, while it remained extended; thus the performer desires any one to reckon five pieces, which are accordingly placed on the table before him, the conjuror then takes them up, and having dexterously palmed one, he adds it to the number as he places it in the hand of the unsuspecting person.

Tom and his sisters expressed themselves much pleased and surprised with the dexterity of the performer. 'But,' added the intelligent boy, 'I should be much more gratified by tricks that were indebted for their mystery to some philosophical principle.'

Mr Seymour, turning to his son, said, that if he waited patiently he would shortly be gratified in that wish, for he knew Crank Smirky was prepared to exhibit some recreations in divination, that were founded on the science of numbers.

Nor was Mr Seymour mistaken; for after a few more specimens of his dexterity, the conjuror requested Mr Twaddleton, who was sitting directly in his front, to taken an *even* number of counters in one hand, and an *odd* number in the other; and he would tell him, he said, in which hand he held the even number. Mr Twaddleton having complied with the request, he was further desired to multiply the number in the right hand by any *even* number he pleased, as, for instance, 2; and that in the left hand by an odd number, as 3.

'I have done so,' said the vicar.

'Then be pleased to add together the two products, and tell me whether the sum be odd or even.'

'It is odd,' replied Mr Twaddleton.

'If so,' said the conjuror, 'the even number of counters will be in your right hand.'

The vicar exposed the counters, and admitted the correctness of the conjuror's decision.

NOTE.—This problem is to be found in Hutton's Recreations, and is stated as follows:—

'A person having in one hand an *even* number of shillings, and in the other an *odd*, to tell in which hand he has the even number.

Desire the person to multiply the number in the right hand by any even number whatever, and that in the left by any odd number; then bid him to add together the two products, and if the whole sum be odd, the even number of shillings will be in the right hand, and the odd number in the left; if the sum be even, the contrary will be the case. By a similar process, a person having in one hand a piece of gold, and in the other a piece of silver, we can tell in which hand he holds the gold, and in which the silver. For this purpose, some value represented by an even number, such as 8, must be assigned to the gold, and a value represented by an odd number, such as 3, must be assigned to the silver; after which the operation is exactly the same as in the preceding example.

To conceal the artifice better, it will be sufficient to ask whether the sum of the two products can be halved without a remainder; for, in that case, the total will be even, and in the contrary case odd.

It will be readily seen that the pieces, instead of being in the two hands of the same person, may be supposed to be in the hands of two persons, one of whom has the even number, or piece of gold, and the other the odd number, or piece of silver. The same operations may then be performed in regard to these two persons, as are performed in regard to the two hands of the same person, calling the one, privately, the right, and the other the left.'

'Ladies and gentlemen,' exclaimed the man of mystery, 'I now humbly crave your silent attention, while I exhibit one of the most wonderful examples of my art. Here is a ring—there a shilling—and there a glove. I shall presently request each of the three gentlemen before me to take one of those articles, so secretly as to prevent the possibility of my discovering the choice he may have made. I have here, you perceive, twenty-four counters; *one* of which I shall give to you, Mr Seymour; *two* to you, reverend sir; and *three* to you, my young philosopher; the remaining eighteen shall remain on the table. Now, gentlemen, I shall retire, and during my absence you will be so good as to distribute the three articles in any way you may think proper.'

The professor, accordingly, walked off the stage, when Mr Seymour took the ring, the vicar the shilling, and Tom Seymour the glove. The conjuror, on his return, said that he had one more favour to request, that the person who had the ring should take from the eighteen counters on the table as many as he already possessed; the one with the shilling twice as many, and the person with the glove four times as many as he before possessed. The conjuror again retired, in order that the distribution might be made without his observing it. On returning, the conjuror, having first cast his eye upon the counters that remained on the table, informed the company that Mr Seymour had taken the ring, Mr Twaddleton the shilling, and the young gentleman the glove. The moment the parties assented to this decision, the whole company expressed their satisfaction and astonishment by thunders of applause.

'That is really very ingenious,' observed the vicar.

'How could he perform it?' said Tom; 'it is evident that his only guide was the number of counters left on the board.'

'I understand the process by which it was accomplished, and will endeavour, at some future time, to explain it,' replied Mr Seymour.

A number of similar tricks followed, all of which depended upon some algebraical calculation; and the performance was concluded to the entire satisfaction of all present.

NOTE.—It is by discovering the number of counters left on the board that the above trick is performed. By means of a table the problem may be immediately solved; but as such a reference would be inconvenient, and, indeed, destructive to the magic of the trick, a Latin verse is substituted, which may be easily carried in the memory, and will be found to answer all the purposes of a table. In order, however, that the reader may become thoroughly acquainted with the machinery of the trick, we shall explain it in the words of its author. The problem is stated as follows:—'*Three things being privately distributed to three persons, to guess that which each has got.*'

Let the three things be a ring, a shilling, and a glove. Call the ring A, the shilling E, and the glove I; and in your own mind distinguish the persons by calling them first, second, and third. Then take twenty-four counters, and give one of them to the first person, two to the second, and three to the third. Place the remaining eighteen on the table, and then retire, that the three persons may distribute among themselves the three things proposed, without your observing them. When the distribution has been made, desire the person who has the ring to take from the remaining eighteen counters as many as he has already; the one who has the shilling to take twice as many as he has already, and the person who has the glove to take four times as many. According to the above supposition, then, the first person has taken one, the second four, and the third twelve; consequently, one counter only remains on the table. When this is done, you may return, and, by the number left, can discover what thing each person has taken, by employing the following words:—

1	2	3	5	6	7
Salve	certa	animæ	semita	vita	quies.

To make use of these words, you must recollect, that in all cases there can remain only 1, 2, 3, 5, 6, or 7 counters, and never 4. It must likewise be observed, that each syllable contains one of the vowels, which we have made to represent the things proposed, and that the first syllable of each word must be considered as representing the first person, and the second syllable the second. This being comprehended, if there remains only one counter, you must employ the first word, or rather the two first syllables, *sal-ve*, the first of which, that containing A, shows that the first person has the ring represented by A; and the second syllable, that containing E, shows that the second person has the shilling represented by E; from which you may easily conclude that the third person has the glove. If two counters should remain, you must take the second word *cer-ta*, the first syllable of which, containing E, will show that the first person has the shilling represented by E; and the second syllable, containing A, will indicate that the second person has the ring represented by A. In general, whatever number of counters remain, that word of the verse which is pointed out by the same number must be employed.

* Darton and Clark, London.

SAXON WORDS IN THE ENGLISH LANGUAGE.

The English language consists of about thirty-eight thousand words. This includes, of course, not only radical words, but all derivatives, except the preterites and participles of verbs; to which must be added some few terms which, though set down in the dictionaries, are either obsolete, or have never ceased to be considered foreign. Of these, about twenty-three thousand, or nearly five-eighths, are of Anglo-Saxon origin. The majority of the rest, in what proportions we cannot say, are Latin and Greek; Latin, however, has the larger share. * * * Sharon Turner has adduced passages from a series of our most popular writers. The passages in question are from the Bible, Shakspeare, Milton, Cowley, Thomson, Addison, Spenser, Locke, Pope, Young, Swift, Robertson, Hume, Gibbon, and Johnson. In five verses out of Genesis, containing one hundred and thirty words, there are only five not Saxon. *In as* many verses out of the Gospel of St John, containing seventy-four words, there are only two not Saxon. Of the remaining passages, that from Shakspeare contains eighty-one words; of these the words not Saxon are thirteen; that from Milton ninety; not Saxon, sixteen: that from Cowley seventy-six; not Saxon, ten: that from Thomson seventy-eight; not Saxon, fourteen: that from Addison seventy-nine; not Saxon, fifteen: that from Spenser seventy-two; not Saxon, fourteen: that from Locke ninety-four; not Saxon, twenty: that from Pope eighty-four; not Saxon, twenty-eight: that from Young ninety-six; not Saxon, twenty-one: that from Swift eighty-seven; in which nine only are not Saxon: that from Robertson one hundred and fourteen; not Saxon, thirty-four; that from Hume one hundred and one; not Saxon, thirty-eight: that from Gibbon eighty; not Saxon, thirty-one: that from Johnson eighty-seven; not Saxon, twenty-one. In none of these passages is the number of foreign words greater than one-third; in many of them less than one-tenth. In all, there are fourteen hundred and ninety-two words, of which only two hundred and ninety-six are not Saxon. If we were to take this as a criterion, the Saxon would constitute about four-fifths of the language, instead of five-eighths—or about thirty-two fortieths, instead of twenty-five fortieths.—*Edinburgh Review.*

[Excepting so far as it solves a question in philology, the above exposition is of no value. For some years there has, we think, been a needless fuss about composing in Saxon, or using if possible only words of a Saxon root. Properly speaking, it is of no consequence whence our language is derived; all that writers or speakers have to attend to, is to employ the words which most forcibly and simply express their meaning; whether these be originally from the Saxon or Roman, is a matter of extreme indifference. The object with all writers should be to write *English*, not Anglo-Saxon.]

DEPARTING EMIGRANT'S SONG.

On the hills of our fathers the sunset is streaming,
I see their brown peaks from the wave:
Upon them in splendour the day-god is beaming,
That cherished more fondly may be, in our dreaming,
The last glimpse of home which he gave.

We thank thee, bright sun! for we still would remember
The scenes that around us have smiled;
Our theme shall they be on the eves of December,
When brightly and cheerily glows the red ember,
Afar on our hearths of the wild.

Our children shall hear of their forefathers' glory,
And lisp in the tongue which they spake;
The triumphs of peace, and the victor-fields gory,
Embalmed in our songs, and recorded in story,
Their young emulation shall wake.

Yes, Scotland! by us in our joy and our sorrow,
Thy name ever hallowed shall be;
Though far from thy shores shall we be ere the morrow,
A gem from thy crown shall we strive still to borrow,
And ever be worthy of thee.

T. S.

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

NUMBER 433. SATURDAY, MAY 16, 1840. PRICE THREE HALFPENCE.

OUTSIDE AND INSIDE.

THERE is an outside and inside in many things besides stage-coaches. We usually at first see only outsides, and think of nothing else; but as we go on in life, we begin to find that there are insides also, and that we must turn up the lining, and look below, in order to ascertain the real characters of things.

Look along any respectable street in one of our large towns—how demure and unimpeachable all the houses appear! Go even into the inside, and be shown up to any of the drawing-rooms, how proper every thing looks! You may ultimately be on visiting terms with the occupants, and dine with them several times, and still all will be smooth and fair. If there be, as often happens, some inmates of pleasing aspect and manners, the favourable impression will be deepened; and you will be apt to suppose that here there is no trace of those jars and cankers which afflict or have afflicted some other home with which you have become familiar. But, in truth, though in one sense you have been in the inside of the house, you are still on the outside of it. You have never yet penetrated below the hardened formal exterior which artificial manners and a wish for good standing with the world impose upon the family. You have only observed that all are well bred, and converse pleasantly with each other, and that there is no apparent lack of the ordinary comforts of life. And such is all that most of us know of each other who live in cities, and only make occasional visits according to invitation. In order to see the *real* inside of the house, it is necessary to eat in it, not perhaps a whole peck of salt, but at least no inconsiderable quantity, and that in the course of a domesticated residence. It is curious then to find little revelations of the real state of matters gradually breaking out. Perhaps the effect is only like that of subjecting the cheek of beauty to the microscope—coarseness found where all seemed of polished and waxen fairness. Perhaps real woes appear—darkened fortunes and keen apprehensions of future evil—irreconcileable discrepancies of temper in those whom no man can put asunder—bitter though not loud wailings over some member of the flock who seems irretrievably committed to a downward course. A few days may see the stranger who at first deemed all so fair and placid, made the reluctant confidant of parties who have deadly complaints to make of each other. But why peruse the whole catalogue of domestic vexations? Suffice it to know, that of such a nature are the things found in the *real insides* of many externally good-looking houses. How vain, then, for any one to envy another for an apparently happy home! In all probability, did he know the real character of that other home, he would gladly be contented with his own.

All men have outsides and insides—that is to say, all conform more or less to modes of external decency perhaps in some degree inconsistent with their real character. But while some do this without losing a particle of their innocence, and are in reality as good or perhaps fully better than they appear, the inside in others is, we need scarcely remark, a very different thing from the outside. The extent to which men can simulate virtue, is strikingly proved by the exposures which occasionally take place of superlative hypocrites—men who, after half a lifetime spent in the enjoyment of the highest reputation, are suddenly found to have been delinquents of the blackest dye. Perhaps nothing could entirely protect society from culprits of such extraordinary secretiveness; but surely disappointment would less frequently be felt with the highly esteemed men of the world, if the proper grounds of esteem were better understood. Professions of opinion, expressions of sentiment, wearing solemn looks, conformity to the merest formalities, at present serve as well to gain high reputation as the most noble practical goodness: are we to wonder that bad men so often impose upon the world, when the world may be said actually to tempt them to try the experiment? Did men look for tests of each other's value only in the good deeds they did, their forbearance and kindness towards their fellows, all those things which constitute the really good man, and which alone the wicked find it difficult to simulate, then might we expect to see hypocrisy come less speed. But even appearances of practical goodness may deceive. They often flow, like certain kinds of talent, rather from infirmity or disease of mind, than from any better cause. Unless they be accompanied by the marks of perfect sanity of reason, unless quite free from all taint of enthusiasm and extravagance, let *them* also be distrusted.

The outside is unfortunately what men do and always will chiefly judge by; but this is rather because they find it most convenient, or want the power in all cases to go below the surface, than from a deliberate choice of means. By this habit, such as it is, many peculiarities of human conduct of a less serious nature than the above are governed. Men of simple nature, who think well of themselves, show that they do so, and are called vain and held very light, although they may have many really good qualities: perceiving this, a man of equal or greater self-esteem, but of more worldly nature, conceals the feeling, and, being thought a rationally modest person, is well spoken of, although in truth not nearly so good a man as the other. This is because the self-esteem is an external feature, always conspicuous, and always calling for attention. In like manner, affectations which may amount to mere foible often procure more detestation for those who are guilty of them, than an equal number of grave but unobtrusive vices would do. To turn to another case. The ancient Misses Prinsep, descended from an old but decayed family, and possessing but a very moderate income, have contrived amidst all their poverty still to retain a liveried and half-starved footman; while Mr John Newall, the affluent mercer, who lives next door, has never yet found courage to hire a scullion-boy,

> "——————— lest all
> Should say that he was proud."

No one who does not know the circumstances of the parties minutely, would ever compare the plain-looking menage of the Newalls to the aristocratic style of the old ladies; yet, in sober truth, the Newalls spend more upon luxuries of the most superfluous nature in a month, than the sparing Misses Prinsep do upon their whole household in a quarter of a year. The Newalls escape all supposition of extravagance, simply because their liberality is all directed to things which make no show. But the footman of the Misses Prinsep is an overt act. It is one of the broad marks of style which people think there is no mistaking. And hence it happens that the one of these parties clings to a remnant of high state which circumstances do not justify, while the other, who could afford it twice over, dare not aspire to it. It is perhaps to modifications of the same principle that we are indebted for the infinite varieties of vehicles and equipages which now every where meet the eye, all of them being intended to give the convenience of a carriage, but yet not to look quite like one. Some are low in the wheels; some are professedly open, but with supplementary panels and flaps by which they may on occasion be closed. Some have one peculiarity, some another, but all stop short in some way of the character of the full-blown carriage or chariot; and this, we are persuaded, in most instances, not so much for a saving of price or current expense, but merely on Mrs Gilpin's modest principle, already adverted to. Generally, if fortune continues to smile, the downright carriage is reached at last, but only after a great number of preliminary wrigglings and blinkings, marking the extreme fear of exciting public remark by an external and *showing* piece of finery.

In little communities, where every one knows every thing about every other person, the physical outside is of little consequence. At least no one feels himself bound to dress *up* to his station. But in larger communities, where most are strangers to each other, externals become matters of the first importance. There every one must have an outside at least not inferior to his station or character; otherwise unpleasant mistakes would be occurring every hour of the day. On the other hand, the outside being the principal means by which individuals in such circumstances are to be judged of, the evil-disposed have it in their power to assume almost any character. A suit of goodly attire brings the varlet upon a level with the respectable man at once; and hence it comes to pass that the fair outside is, in such communities, rather a negative than a positive recommendation. It is not to be dispensed with, but it will not serve as an absolute diploma of respectability. In the mind of a Londoner, a well-dressed man may be any one of thousands of characters, from the first statesman of the land down to the pickpocket. Something more is needed, to establish a claim to tolerable consideration. In a late novel, a worthy old gentleman is represented as treated in the most insolent style in a police-office, where he had appeared to give evidence against a young petty larcenist, and the sketch appears, as designed by the author, to reflect the greatest discredit on the discrimination, as well as good feeling, of the judge; yet, when the dubiety of all merely external appearances in a great city are considered, such conduct on the part of a man who may be supposed to be accustomed to see all kinds of false appearances put on, looks scarcely unnatural.

There is an outside and an inside kind of pride, as may be well seen in the familiar anecdote of Plato and Diogenes. The neat house and well-arranged silk couch of Plato were marks of outside pride; the act of Diogenes, when he came in and trod with dirty feet on his friend's couch, saying, "Thus I trample on the pride of Plato," was a signification of inside pride. Plato was right when he replied, "And with greater pride, Diogenes." The outside pride which merely takes the ordinary modes of showing itself, such as good dress or a neat household, is a much lower measure of the sentiment, than the inside, which wraps itself up in the disguise of a contempt for those things, and is content with its own meditations. In the cynic's case, the process of ideas may be supposed to have been somewhat like the following: "There is a general taste for gay furnishings of house and person. If I live and dress in that style, I shall be confounded with the common herd. To distinguish myself from them, I shall dwell in a tub, and wear a filthy and ragged cloak." The pride which could dictate such a course was probably as much greater than the other species of the passion, as the number of those who acted like Diogenes was less than those who acted like Plato—for singularity was the real object. In modern times, this passion less frequently exhibits itself in an affectation of slovenliness, than in that of a style of extreme plainness. It is made a principle to eschew certain colours and modes, favourites with the ordinary people of the world; at the same time that excessive richness in substance and ultra cleanness in condition are indulged in, so as to make it clear that poverty has no concern in the matter. At first sight, one is apt to respect a feeling which seems thus to repudiate common indulgences; but its real character of a pretension to some-

Digitized by Google

thing above the common run of our nature, soon becomes apparent. A person of well-balanced mind, therefore, prefers partaking of the common ways of the world, where innocent, to indulging in such fancies, because he sees that, even though the former may involve a little frivolity, it is more amiable as well as more rational to submit to that, than to set up for something so like a standing reproach of all mankind, and that in things upon the whole indifferent.

Still more strange to say, there is an inside and outside kind of conscience. It is a thing, as one might say, in two layers. The outside conscience is the one for common use, when men have not only to consider something like the promptings of justice, but also some circumstances affecting their own interests or those of parties with which they are connected, or when they act under the influence of strong prejudices. The inside conscience is one rarely called into action, and only when either there are no lateral circumstances to be considered, or all bewraying views have been by some singular chance pushed aside. We often wonder at the strangely bad courses taken by political parties, all the men as individuals being known to us as "honourable, most honourable men." We wonder at the unrighteous doings of high men of state in regard to public matters, when we know that they would not willingly do injury to any single person under them. We wonder at the licence which men will take as members of a corporation, who in their private capacity would do justice to the last farthing. The mystery is explained by our theory of an outer and an inner conscience. They think themselves as conscientious in the one case as the other; but only in the one case they are acting with the coat conscience on their backs, and in the other with the waistcoat. How much better it would be for the community if public men in all instances worked in their vests, we need not pause to consider.

We must now conclude our speculations; and, as a climax is needed in all such things, we think we cannot do better than recommend to our readers to be generally on their guard against the Outside,* which they will almost invariably find to be illusive and betraying, and to look only to that within, "which passeth show."

THE INFLUENCE OF ARTIFICIAL LIGHT ON VISION.†

We have recently been favoured with a short treatise, by Dr James Hunter, surgeon to the Eye Dispensary of Edinburgh, on the subject indicated above, one of very considerable interest to mankind. It is impossible for people living in a state of civilised society to avoid the extensive use of *artificial* light, by which is to be understood every species of light excepting that derived from the sun and the heavenly bodies; and hence the importance of inquiring how far and in what manner such light is injurious, and to what extent the effects resulting from it may be prevented or remedied. We do not propose here to review the whole question, but only, by a few extracts, to call attention to Dr Hunter's treatise, where the subject is handled in a very able and satisfactory manner.

The following simple experiment is proposed by Dr Hunter, as a mode by which any one may convince himself of the comparatively hurtful nature of artificial light:—"Tie up the left eye, and with the other look steadily and closely, for about a minute, at some very small object placed on a sheet of white paper, and strongly illuminated with ordinary day-light, but not exposed to the direct rays of the sun: then uncover the left eye, and look at some distant white surface, such as the ceiling of the room, first with the left eye, and then with the right one. It will be found that there is not much difference in its appearance as seen by the one eye or by the other, though in general it will be a very little brighter to the left eye. After this darken the room, by closing the shutters; tie up the left eye again, and then with the right one look at the same object, placed on a sheet of white paper as formerly, but illuminated by a large tallow candle or oil-lamp, so that it shall be seen as distinctly as it was in day-light. Keep the right eye fixed on this object for about a minute, so as to examine it closely and narrowly: then extinguish the candle or lamp, open the shutters, and uncover the left eye. When both eyes are now turned to the ceiling, it will appear somewhat dim and indistinct; and on looking at it first with the one eye, and then with the other, the difference will be very remarkable. To the left eye, which had not been exposed to the action of the artificial light, it will appear unchanged;* but to the right eye it will be very dim, and of a dark blue or purple colour. This shows that, by exposure to candle-light, the retina of the right eye has been rendered partially insensible to the action of day-light." From long-continued exposure to artificial light in this way, the diminished sensibility of the retina to light becomes a permanent affection, and entire blindness may follow.

Dr Hunter then enters minutely into the morbid consequences upon the eye, or in other words the diseases, produced by artificial light. The most remarkable of these is the state in which floating films, or *muscæ volitantes*, are seen on the organ of vision, an affection which sometimes becomes very serious in its consequences.

"When one of these films is first observed, it is often very difficult for the patient to be convinced that it is not merely some light substance floating in the air, and he generally makes an attempt to drive it away with his hand; in doing so, he rolls the eyeball, and as the film immediately disappears, he is confirmed in his belief that what he saw was nothing more than perhaps a bit of cobweb or a particle of soot. After some time he begins to doubt the correctness of this supposition, by the frequent recurrence of the symptom, and by finding that the cobweb is seen by no one but himself. At last he is quite convinced that the film is really caused by some defect in the eye itself, by observing its motions; for so long as the eye is kept stationary, the film remains stationary also, but the moment the eye is moved, it flies off in an opposite direction. When the eyeball is slowly rolled upwards to the light, the film gradually sinks downwards, and if, just as it appears to be going out of sight, the eye be suddenly directed downwards, that instant the film flies away upwards, and is seen no more at that time. At first these *muscæ volitantes* are perceived only at intervals, often of some days, and generally are most common the day after the eyes have more than usually been excited in working by artificial light. Their duration is very transitory, and they seldom continue visible for more than a few seconds at a time. They are not often seen when looking at a coloured object, particularly if its colour be of a red or orange hue; but they are much more frequently observed when the eyes are turned to a white surface, such as a sheet of paper, the ceiling of a room, or a light cloud in the sky; and a misty day in summer, when the sun's light is strong, and much diffused by the atmospheric vapours, is by far the most favourable time for their appearance. In the first stages of the disease, the dark films are not often seen by artificial light, at least in cases where the insensibility of the retina is either entirely or chiefly occasioned by its injurious action. But when the eye looks at the flame of a candle or lamp, either with or without the intervention of a shade of obscured glass, there very frequently is a curious appearance, as if a number of very minute and transparent globules, resembling drops of oil on the surface of water, and connected with each other like the links of a chain, were floating slowly through the air, in the same way as the dark films observed in day-light." Amaurosis, or nervous blindness, is another disease liable to be produced by artificial light. But, in place of following Dr Hunter into the minutiæ of these diseases, and their mode of treatment, we believe it will be more satisfactory to general readers to present them with his views on the "Choice of Artificial Light," and the comparative advantages and disadvantages of each.

"It is only (says our author) when the eyes are exerted on minute objects, that artificial light is so very injurious. In public places the light is not always so strong as to injure the eyes by its direct action, and it proves hurtful chiefly by the quantity of carbonic acid that is produced by the combustion of the light-giving materials; besides, as in such places the sight is not constantly employed on one object, the bad effects of the peculiar colour of the light are often counteracted by the variety of tints reflected from the walls and furniture. But in reading, writing, sewing, type-setting, and other occupations requiring the severe, long-continued, and nightly exertion of the eyes, the light requires to be of considerable defining power; and to obtain this, it must be placed very near the eyes, which it injures by its heating effect as well as by its bad colour.

The circumstances to be attended to in considering the comparative advantages of different kinds of artificial light, are, 1. Purity of colour. 2. Practical convenience. 3. Economy. Oil-gas gives a very fine light, and at one time numerous companies were formed for manufacturing it; but the great expense of it proved a barrier to its general introduction. The gas obtained from rosin gives fully as good a light as oil-gas. Professor Daniell took out a patent for it, and a joint-stock company was formed to manufacture it; but after expending more than L.50,000 on the works, the design was given up, as it was found that, though rosin-gas was of first-rate quality, it was too costly to compete with coal-gas.

I would place the light of gas made from *parrot* or *cannel* coal as next in purity, and first in convenience and economy. The light procured from the finer sorts of oil, especially refined sperm-oil, is the next in purity, and perhaps, in some instances, even superior, in this respect, to the light of gas made from parrot or cannel coal; but it is much less convenient and much more costly. In burning oil for the purposes of illumination, a great deal depends on the construction of the lamp, but the argand arrangement is by far the best, and is almost universally used. Next to the finer sorts of oil, the purest light is obtained from wax, spermaceti, stearine, and cocoa-nut candles; but although the quality of their light is good, it wants steadiness, the candles burn down, and all of them are more or less liable to gutter and swill, particularly where there is a varying draught of air.

The gas distilled from common sea-coal *contains* much less carbon, on which it has been shown that its illuminating power depends, than gas made from parrot or cannel coal; it burns with a reddish-yellow flame, of great heating power, and very hurtful to the eyes, and is quite unfit for in-door use, excepting in halls, or in public places where the eyes are not to be much exerted on minute objects. This inferior kind of coal-gas is that generally used in London, and it is a great pity that some of the metropolitan gas companies do not use a better coal, the greater cost of which would be compensated by the gas made *from it* being much more generally employed in private *houses* than at present. [In Edinburgh, gas is made from fine cannel coal, and is therefore burnt in the apartments of private houses, without creating either offensive odour or smoke.]

The light of common coarse oil-lamps and tallow candles is of very inferior quality. The lamps have the advantage of maintaining the source of the light at one elevation, and the size of the flame does not vary so much as in tallow candles, particularly the coarser kinds; for in them not only is the colour of their light highly injurious, but from the constant flickering and variation of its intensity according to the state of the wicks, they are quite unfitted for the illumination of minute objects on which the eyes are to be much employed.

All things considered, I think that the light of gas made from parrot or cannel coal is the best adapted for general purposes: the great recommendations are its purity and equability, its admitting of being so easily placed in any position, the facility of increasing or diminishing its intensity as required, and its cleanliness, safety, and great economy."

Dr Hunter conceives, that, in burning every kind of gas, the argand lamp is not only the least *likely to* injure the eyesight, but the most economical *form of* using the article. He concludes his reflections upon the choice of artificial light by remarking that, where "the sight is much employed on fine work by gas-light, advantage should be taken, during any temporary interruption or interval, of the great facility with which the intensity of the light may be instantly diminished, so as to afford an occasional short period of rest to the eyes, and allow the exhausted retina to recover its tone." The effect of such a temporary repose is decidedly beneficial; and cold-bathing, at such intervals, is recommended by Dr Hunter as an additional preventive of bad effects.

In artificial light, the *blue rays* are *deficient*, and the *red* and *yellow rays* in *excess*. In this simple fact, according to the author of the treatise before us, we find the true cause of the injurious action of artificial light. Accordingly, his plans for the prevention of that injury, through mechanical aids and contrivances, have one and all of them a distinct and philosophical reference to these causes of mischief. We shall allow him to describe the first of these contrivances in his own words, though we must refer to his treatise for the figures with which he illustrates this branch of his subject.

"For the improvement, by optical means, of the naturally bad colour of artificial light, on which its injurious action so much depends, two different methods may be employed.

1. The addition, by reflection, of the blue rays that are deficient.

2. The subtraction, by absorption, of the red and yellow rays that are in excess.

In the first of these methods, the light that passes upwards is to be deprived of its red and yellow rays by some *blue* intercepting surface, to reflect downwards the few remaining blue rays, which, mingling with the reddish-yellow coloured light, proceeding directly from the flame, shall form a compound light of a white colour, from the primary rays contained in it being nearly in the same proportions to each other as in daylight. In the second method, the direct light

---

* Of the propriety of looking below the surface to find the real characters of men as distinguished from their pretensions, we have not for a long time met a more engaging illustration than the following, which we find in a recent newspaper:—

"WHO IS THE POOR MAN'S FRIEND?—It is easy to assume the title of 'A Friend to the Poor.' I know a man who possessed slaves, who violently opposed the abolition of slavery, and who defends the slave-trade itself, but who, for motives best known to himself, has taken upon himself the title of Poor Man's Friend—has become the champion of paupers, the enemy of the new poor-law, and the persecutor of the guardians of the union in which he resides. I know a man who delights in war and bloodshed—who, even in time of peace, can neither think, speak, nor write, but to fight his battles over again—he would not shed a tear for the groans and pangs of 20,000 men dying on the battle-field, or of their widows and orphans left behind; on the contrary, he would be glad, for the sake of employment, and the increase of his income, if war again broke out, although it might not cease till millions of *poor men* had fallen victims to the senseless quarrel; yet, strange to say, he also has added to his military title that of 'Poor Man's Friend!' I know a man, for whom no labourer will work, who himself informed me that he was under the necessity of mowing his own lawn, and digging his own garden, 'because,' said he, 'when I apply to those rascally labourers, although in the evening they promise to come to work for me, yet in the morning they are sure to disappoint me.' This was a curious phenomenon, and I inquired into its cause, and found that he was a hard master, celebrated for grinding the poor, always bating down their wages, and stipulating for a less sum than that for which they could afford to work, and for this he was odious in their sight. Happily, however, for him, the new poor-law passed, and caused excitement in the place, and he came forth as the 'Poor Man's Friend!' I know a man who paid our distant poor, and who for five years professed to pay 3s. 6d. a-week to a widow at Bristol, but who had kept back 2s. a-week all that time, thus robbing the parish and the poor of L.25, as was proved by the magistrates, and confessed by himself. When the select vestry were examining into the cases of all the poor upon the list, this man exclaimed loudly against the cruelty of *diminishing* the pay of *poor widows* at a distance, or of causing them to come and give an account of themselves. When, however, this *poor widow* did accidentally come, it appeared that she was a young and hearty woman, who had been married again the preceding four years to a respectable mason of Bristol."—*The Rev. T. Spencer of Bath.*

Laing and Forbes, Edinburgh. 1840.

* Sometimes it is of a pale reddish or yellowish-white colour, when seen by the left eye.

Digitized by Google

emanating from the flame is to be passed through some transparent medium of a blue tint, such as stained glass, or a coloured fluid, which shall absorb the excess of red and yellow rays, and transmit white light.

I will begin by describing the first, or the reflective method of improving the colour of artificial light, as being the simplest, and perhaps the most generally useful. All that is requisite is to provide a conical reflector [like a section of the lower part of a sugar loaf], the inner surface of which should be stained or painted of a sky-blue or azure colour; this reflector must be placed round the flame. The effect of this arrangement is, that all the light passing upwards is intercepted by the sloping sides of the reflector; its red and yellow rays are absorbed, whilst the blue ones are reflected downwards, and made to combine with and improve the bad colour of the light proceeding directly from the flame.

The reflectors may be made of any convenient material, such as silk, tinted paper, or painted metal. The silk reflectors are the most elegant, but they are more expensive, and apt to be injured by the heat; those made of stiff paper or bristol board are cheap, easily made, and answer very well; but the most durable, and perhaps the best, are made of tin-plate or sheet-brass, bronzed on the outside, and painted of a light sky-blue on the inside. No pigment answers so well for giving the necessary tint to the reflecting surface, as a mixture of ultra-marine and prussian blue. When a light blue-coloured reflector is placed over an ordinary flame, the effect is very marked; objects, such as the page of a book, no longer appear of a reddish-yellow colour, but of a much whiter and purer colour; the light becomes delightfully cool and agreeable to the eyes, and, from its whiteness, its defining power is much increased."

The second method of improving the colour of artificial light, is by causing it to pass through a medium of a pale blue colour, thus absorbing the excess of red and yellow rays. Dr Hunter does not approve much of the blue spectacles used for this purpose, as the eye is liable to overlook them, and as they do not moderate the heat of the light. A better plan, according to him, is to use an argand lamp with a pale blue glass chimney, and with a conical reflector of polished metal to throw down the light in a concentrated form, and so make up for the darkening caused by the coloured glass.

Dr Hunter conceives that where the light is not above the level of the eye, and must fall on the organ, it is necessary to use shades as a preservative, and approves most of those which are painted interiorly with ultra-marine, worked up with mastic varnish. There are many other practical lessons of great value in the work from which we have made these excerpts. We are bound to say, that this is the first time that we have ever seen the subject under consideration treated in a philosophical way, important as it has always been to mankind.

STORY OF HARRIET SHIRLEY.

"So, my sweet cousin, you faithfully promise to be my little wife—don't you?"

"No, I won't be your *little* wife, for when you come back, I shall be tall like mamma or aunt Mary. I will be your great, tall wife."

"Ah, but, my pretty Harriet, you forget how long I may be away, and that I may come home a withered, frightful-looking old man, all wrinkled, and blackened by the sun. What should you say to me then, Harriet? You will still be quite young when I am very old, and I am afraid you will forget your promise to poor cousin Arthur."

"Oh no, indeed I shall not—if mamma will let me love you then; I wont forget you."

This brief conversation, so abruptly reported to the reader, passed between a young man of seventeen or eighteen, and a little girl, some eight or nine years younger, with whose family his own was distantly connected. Arthur Carey was the son of a thriving and respectable attorney in London, and had received a good education preparatory to his entrance on his father's profession. But the untimely deaths of both his parents materially altered his position and prospects. Being not yet ready for a legal career, and having little or no means left him for the completion of his studies, he might have been in a situation of great distress and difficulty, but for the intervention of a distant relative, Mr Shirley, who invited the youth to his house, and bestirred himself so actively in his favour, as to procure him a civil appointment or clerkship in the East Indies. All this was the more honourable to Mr Shirley, as he was far from being a wealthy man, and had a sufficient family of his own to provide for, without expending his interest or means in behalf of one who had but very remote claims upon him.

Arthur Carey passed the period intervening between his appointment and his departure at the house of Mr Shirley, where he received so much kindness as touched his heart warmly and lastingly. It was at this time that the conversation already recorded took place between him and his little cousin, as he called her, Harriet Shirley. It would be ridiculous to say that the dialogue was a serious one, though perhaps the child, in her youthful simplicity, was perfectly in earnest, and though Arthur felt at the time, in his heart of hearts, that it would be delightful at some future period to connect himself with the family from which he had received so much kindness, and for every member of which he felt so strong an affection. As was natural, however, Mrs Shirley and aunt Mary, who were auditors of the conversation between Arthur and Harriet, only smiled at it as a passing jest.

Arthur Carey bade farewell to his friends, and embarked for the Eldorado of the youth of Britain, the great empire won by the valour of their fathers in the East. He owed to Mr Shirley's care many of the necessaries composing his outfit; and thus was the feeling of gratitude deepened towards that generous friend. By him, Arthur was also supplied with letters of recommendation to parties of rank and influence in Madras, which was the youth's particular destination. On his arrival there, he found these letters of much consequence. They introduced him to a circle of friends who had a great deal in their power, and gave him the opportunity of gaining their esteem, and so ensuring the future exercise of their interest in his favour. Possessed of a good person, engaging manners, and abilities well developed by education, young Carey was indeed calculated to make his way rapidly in society. Before two years passed, he had raised himself from the subordinate position in which he had commenced his Indian career, to a situation seldom held by one so young, and was already in the enjoyment of an income much above his wants. The prospects, also, which he had of further promotion, were excellent, provided he pursued the same active and industrious line of conduct which he had entered upon at his starting.

And what, does the reader think, was the purpose to which Arthur applied his first free earnings in India? The following extract from a letter written by him to Mrs Shirley, will explain the matter:—"I owe much to Mr Shirley, more than I can ever repay. The remembrance of what he did for me never leaves, nor can leave, my mind. Indeed, I think of him, and of all of you, continually. I have acquaintances and even dear friends here, but none of them hold the place in my heart which is held by you and yours. Is this to be wondered at? I had no parents, no home on earth, when you took me in, gave me a home, and supplied to me the place of parents. When I hear my young companions speaking of their fathers and mothers in Britain, I think of you, and speak of you to them, with the joyous consciousness that I too have dear ones far away, who remember and love me. * * * My circumstances being such as I describe, I wish so far to show my gratitude for what is past. Mr Shirley obtained for me a settlement in life; will he allow me to do a somewhat similar action by one of his family? The money which accompanies this packet, I give him free leave to dispose of as he thinks fit; but if circumstances permit, and he is willing to dispose of it according to my liking, he will apply it to the education of Harriet. You may not remember a conversation that passed between that sweet little cousin of mine and myself, just before I left England, when she promised to be my 'tall, great' wife. I will not conceal from you that often, often has my mind reverted since to that conversation, and that at this moment I feel that it would be a source of the deepest pleasure to me, to be one day connected with you by a close and irrevocable tie. But it will be time enough long afterwards to think of this. Heaven forbid that I should ever prosecute such a wish, against the future inclinations of either Harriet or you. In the mean time, I think you will not be offended at what I propose, but will regard this as a gift coming from a son or a brother." * * *

It is unnecessary to quote the words of Arthur's letter further. It is enough for our purpose to say that the Shirleys were greatly pleased, rather than offended, by this mark of the young man's gratitude, and that, from this time forth, an idea perfectly in unison with that entertained by Arthur took possession of their minds. Nor did they conceal the circumstance from Harriet, who, whatever was the case with Mrs Shirley, had by no means forgotten, young as she was, the promise to poor Arthur. She was now about ten years of age, and, in accordance with the wish expressed in the preceding letter, her father devoted the money sent from India to the procuring of instructions for her, of a kind which the state of his circumstances, as well as a sense of what was due to the rest of his family, would have otherwise forbidden him to bestow on any one of his children. At the same time, being a man of sense and prudence, he took care not to treat the proposal of Arthur as a solemn and binding engagement, resolving to be guided in the affair by after-circumstances.

When other two years passed away, Arthur Carey transmitted to his friends a second sum for the continuation of Harriet's education. He had gained another step in the career to which he had devoted himself, and his emoluments were now still more considerable, enabling him to increase the amount of his inclosure to Mr Shirley. During the succeeding six years he repeated these transmissions of money every second year, being always, as he told his friends, better and better able to do so, from his advances in his profession. In the interval, Harriet Shirley had sprung up into a beautiful and accomplished woman. And what were her feelings now, the reader may ask, with regard to this somewhat remarkable engagement with Arthur Carey? The truth is, that for several years she had corresponded regularly with him, and by degrees their letters had become those of declared and attached lovers. Miniatures had been exchanged, and to Arthur the soft full blue eyes, light hair, and beautiful complexion of his mistress, were as well known as his own manly, embrowned features were to her. As the family refrained from unnecessarily speaking of the engagement of Harriet, she was not without admirers at home ere she reached nineteen, but, though gentle and flexible to a fault in disposition, she firmly and at once refused them, declaring her heart and hand already engaged. Her family were glad to see this, and Mr Shirley in particular, because he had had occasion more than once to reprove his daughter for her over-easy temperament, which, as he told her, was as likely to impair her happiness as the other extreme of obstinacy.

However, as has been said, Harriet remained unalterably faithful to the image of "poor cousin Arthur," and it was with blushing pride and pleasure that she placed in her father's hands a letter in which Arthur at length tenderly and respectfully entreated her to complete his happiness, and to come to him under the care of the bearer of the letter, who had gone to England for a single month's stay, and was about to return immediately to India. Arthur had hoped to come to England in person for his bride, but he afterwards found this impracticable, without serious detriment to his interests. The bearer of the letter was a Colonel Monson, a gentleman far advanced in years, who had promised to take care of Harriet (Arthur said) as a father would have done. Mr Shirley and his wife, and indeed their whole family, had been so long accustomed to look forward to the union of their daughter with Arthur Carey, that they had no other feeling on this occasion than a natural anxiety that Harriet should perform her destined voyage in safety and comfort. They entertained Colonel Monson for several days, and were pleased to receive from him assurances that every possible attention would be paid to Harriet on her route.

All was bustle and preparation in Mrs Shirley's household during the short month preceding her daughter's embarkation. At length the time came for the farewell. Mr Shirley alone attended Harriet and Colonel Monson to the port whence the Iris sailed. But the father, too, parted from his weeping girl, and then she was left alone. During the first days of the voyage she remained confined to her cabin, partly through a wish to compose her mind by solitude, and partly through the uneasy feelings incidental to a first trip at sea. She derived, in this situation, some comfort from the attentions of Mrs Watt, a middle-aged lady, whom Colonel Monson had introduced to her as the wife of an officer in his corps, who was about to rejoin her husband at Madras, after a visit to Britain. Harriet soon saw that Mrs Captain Watt was not a woman of refined breeding, but her society in such circumstances was nevertheless of some value.

When Harriet first made her appearance on deck, she was received by Colonel Monson with a degree of warmth and *empressement* which seemed to her greatly to exceed the occasion, but she attributed this merely to his kindly nature. However, as day after day passed away, the manner of the old colonel—for, though a hale man, he was considerably beyond the age of threescore—became more and more marked by the same officious attentiveness, so as by degrees to generate rather uneasy feelings in Harriet's mind. She observed, also, that Mrs Watt began to sound the praises of the colonel, and to boast of his wealth, and of the magnificent establishment he maintained or could maintain at Madras. Miss Shirley contented herself with turning a cold ear to these remarks, and giving them no answer. She could as yet scarcely believe that the suspicion which they gave rise to had any serious foundation, particularly as Colonel Monson knew so well the purpose for which she was now on her way to India. But she was ere long undeceived. To her pain and surprise the colonel one day took advantage of a moment when they were left alone, to make her an offer of his hand and fortune!

Harriet Shirley, it has been said, was of a nature rather deficient in firmness, but she could not disguise her anger and disgust at this communication. "Is it possible, sir," said she, "that you can be aware of the engagement which I am now going to India to fulfil, and yet address me in this manner?" "Engagement, Miss Shirley?" replied the colonel, "you cannot call it an engagement! You have never seen Mr Carey—you cannot be attached to him." "You are mistaken, sir, in *every* respect; and I hope that, since you are now aware of it, this will be the first and last time I shall be addressed on such a subject." With these words, Miss Shirley turned away, and retired to her cabin to reflect with pain on this disagreeable confirmation of her suspicions.

Alas! well would it have been for the peace of poor Harriet, had the firmness which she had shown on this occasion characterised her conduct permanently! Colonel Monson was not deterred from his purpose by what had passed. He repeated his addresses in the most pertinacious manner, till the peace of the young lady was completely overturned. When she avoided his sight, he made his subservient friend, Mrs Watt, urge his suit on the poor girl, till she was driven to a state of despair. She had no friend beside her, no one to give her counsel, no one to free her from this persecution. Among other modes of annoyance, Mrs Watt declared that the colonel would certainly destroy himself, if she continued to treat him with cruelty. This last argument had a direful effect on Harriet's mind. Her terrors were excited; she was kept in a

Digitized by Google

state of perpetual alarm, and sleep became a stranger to her pillow. At length, when the vessel cast anchor at the Cape of Good Hope, Miss Shirley's fears and distress were brought to a climax, by the cry, one morning, of "a man overboard!" Mrs Watt rushed to her side. It was the colonel, she said; he had at last thrown himself overboard, as he had threatened to do. In reality, Miss Shirley soon afterwards saw him brought on deck, just rescued from the waters in time to save his life. We shall draw a veil over the particulars of the scene that followed. Impelled by persecution and terror, Miss Shirley became the wife of Colonel Monson at Cape Town, on the day on which the event happened which has now been related.

Had Harriet Shirley known at the time that Colonel Monson, before he threw himself overboard, had paid two men liberally to stand in readiness to pick him up, this sad affair might have ended otherwise. She *did* know of this mean and villanous artifice ere long afterwards, for the coarse and base agent of the colonel, Mrs Watt, scrupled not to avow that the scheme was of her suggestion, and one in which she prided herself in proportion to its success. We cannot describe what were Harriet's feelings on learning this, nor shall we attempt to depict her sufferings on the remainder of the voyage between the Cape and Madras. Let us hasten to the close of our story.

Arthur Carey waited and watched for the arrival of the Iris at Madras, with an eagerness and anxiety not to be described. As the appointed time drew near, his longings increased in ardour. Every leisure moment was spent in scanning the sea in the offing with his glass. On the very day which he had calculated upon, a ship—the Iris—did appear. Arthur lost not a moment in flying to the harbour. He threw himself into a boat, and was rowed to the vessel's side. With a heart beating with a thousand fond anticipations, he sprang upon deck. In an instant, out of all the throng there, his eye selected a well-known face. It was one pale as death. Arthur rushed forward. "Miss Shirley! Harriet!" he exclaimed, as with open arms he made his way towards her; but at the sound of her name she cast her eye hurriedly upon him, and, turning away, fell in a half-fainting state upon the bulwark of the ship. "Stop, sir," cried Colonel Monson, whom Arthur now saw as he reached Harriet's side; "this lady is not *now* Miss Shirley! She is *my wife!*"

The averted looks of Harriet had partly alarmed the young man, and Colonel Monson's words now came upon him with the effect of a stroke of lightning. The shock was more than his mind could bear. He reeled, and fell upon the deck. When he was raised and taken away, reason had fled for ever!

This is an "ower true tale." Harriet yet lives, and indeed is still a young woman; but she is old in misery—a wretched, broken-hearted creature. The man whom she really loved, though she was weak enough to permit herself to be betrayed into wedlock with another, is an inmate of an asylum for the insane.

CONTINENTAL SCHOOLS OF DESIGN.

In consequence of the superior taste which is displayed in the ornamental designs in silk and other fabrics of continental manufacture, the British government a short time ago deputed William Dyce, Esq. to make a personal inquiry into the state of Schools of Design in Prussia, Bavaria, and France, with a view to the improvement of artistic education in this country. Mr Dyce having performed this honourable mission, has, at the solicitation of the House of Commons, laid his Report before the President of the Board of Trade, and it is now published as a parliamentary paper, for general information. We propose to give an abridged view of Mr Dyce's narrative and observations.

In Prussia, the elementary and ulterior instruction of artists forms a considerable department of the general education established throughout the country. Every encouragement is given to the children of the poor and middle classes to cultivate a taste for drawing, founded on the best models and the instruction of masters. There are two principal elementary schools, one at Berlin and the other at Dusseldorff, under the direction of the Royal Academies of these places. Besides these, there are twenty elementary schools of lesser importance in the provinces. These are open to all without restriction, and serve for the instruction of candidates for the higher schools of the academies. In these public academical drawing-schools there are taught, 1. Drawing from the antique, &c. 2. Modelling from the antique, &c. 3. Geometrical and architectural drawing. At the Royal Academy of Dusseldorff, besides an elementary class of this description on week days, there is a Sunday school after the termination of divine service, in which instruction is given gratuitously to the poorer classes. The pupils at these and similar schools are encouraged to proceed, and receive pecuniary assistance in their study of art, according as they show aptitude. Specimens of their work are forwarded to Berlin, and those who have distinguished themselves are rewarded with prizes, or, in remarkable cases, they receive pensions, to enable them to pursue their study at the metropolis. The expenses of the schools are defrayed partly by the government, and partly by universal and local subscription.

Besides this class of schools, there are two institutions at Berlin, the Gewerb Institut and the Bau Academie, both intended for instructing mechanics in various principles connected with their profession, and in some degree analogous to our Schools of Arts or Mechanics' Institutions. The Prussian government appears to be more desirous of cultivating the national taste by means of general instruction, than of rearing a mere body of designers, although that object is not neglected. The higher academies of art produce specimens of ornamental designs, which are dispersed among manufacturers, to guide them in the arrangement of their patterns. The system seems well adapted to a community in the infancy of intelligence and social privileges, and forms a solid foundation for future fame in all branches of the fine arts.

In Bavaria, the cultivation of every kind of ornamental and useful art receives the most liberal encouragement. The plan of public instruction which has been devised by his present majesty, consists of six sections, embracing—Purely scientific education; Purely popular education; Agricultural, combined with scientific education; Technical or Industrial, combined with scientific studies; and Technical, combined with popular instruction. Each of the six sections commences in an elementary grade, and, according to its nature and purpose, finds its termination in some one of the superior steps. In all the sections of instruction, and in every grade, the study of art occupies a prominent place. It is considered to be the duty of all schoolmasters, and of all public officers of the districts where the schools are, to encourage pupils, particularly those who show talent, to apply themselves to drawing of various kinds, and to explain to their parents its importance. In the Polytechnic schools, which are of a high grade, the course of instruction in drawing and designing is very complete, and on the soundest principles of exact science. Much is done to improve the general taste, by the constant exhibition of the finest models of art, both in painting and sculpture. Nuremberg and Munich abound in the finest monuments of taste and industrial art.

As respects the general cultivation of taste, and the advancement in scientific and artistic knowledge, both the Prussian and Bavarian routine of instruction is unexceptionable, but each fails in producing a body of individuals who are closely identified with that class of manufacturers of goods who require ornamental patterns. In France, the routine of instruction in art is more perfect than in other continental countries, as it includes that most important branch which bears directly on the designing of patterns for manufacturers. Of the various schools, elementary and academic, for cultivating pupils for the higher branches of art, it is unnecessary to extract any account, and we shall confine ourselves to that class of seminaries which we should call Schools of Design.

The principal school of this kind is at Lyons, the seat of the silk manufacture. All the students who enter the school commence as if they intended to become artists in the higher sense of the word, and it is not till they have completed their exercises in the drawing and painting of the human figure from the antique and the living model, that they are called upon to decide whether their future pursuits shall tend towards design for industry, or the production of works of fine art. This circumstance, among others, will account for the well-known fact, that the same individuals in France are frequently engaged in both pursuits. The order of study embraces an elementary class for principles No. 1 and 2, in which shadowing and the use of chalks are taught, class of drawing from casts, classes for drawing and painting figures, class of architecture and ornament, class for painting flowers in distemper and oil, classes of engraving and sculpture, and classes *de la mise en carte*, or the art of putting patterns on the cards for the Jacquard loom. The student of design for silk is occupied one year in the study of ancient ornament, arabesques, &c., during which he is exercised also in designing original compositions. The class of flower painting lasts for two years, and the class of the theory of manufacture an indefinite period. The same students are frequently, and indeed generally, in the two latter at the same time, as the two together constitute strictly the study of design for silk. The school is open from nine till two every day, from the 1st of November till the 31st of March, and from eight till one from the 1st April till the 31st of August, when a vacation of two months takes place. The mayor of Lyons nominates the pupils, giving always a preference to the children of merchants or manufacturers who are themselves destined to the manufacture of silk. The school has ten masters or professors, and its annual cost is 28,580 francs, of which 25,480 francs is allowed by the town of Lyons, and 3100 francs by the government.

Besides the branches of instruction given in the school, there are others connected with its main purpose taught in the same building. These are a course of anatomy applied to the arts, which is given every Thursday from three to four, in the saloon of the Museum of Natural History; and a course of practical geometry on Sunday, at one o'clock. The latter is conducted with open doors. Besides the school and these public lectures, there is a museum of pictures, antiquities, and casts of ancient sculpture, which is always open to the students, and to the public on Sunday and Thursday; a museum of natural history, and a library, are also accessible at certain times to the pupils of the school.

"On a review of the method of instruction adopted in the school of Lyons," says Mr Dyce in his Report, "so far as it is connected with manufacture, it appears to me to exhibit the true principle on which a school of design ought to be constituted, whether it confine itself to one branch of industry, or extend its operations over the whole field of ornamented manufacture. By the account I have given of it, the instruction will be observed to be twofold; one part relating to the general study of art, and the other to the process of manufacture to which art is to be applied; the latter naturally giving rise to what constitutes the ultimate purpose of the school; namely, the practice of the particular species of design which is adapted to the reproductive capabilities of the fabric. Thus it will be seen that the elements of the education of an industrial artist, which in the German system are divided among two or three separate schools, are here to be found united in one; that is to say, the relation of ornamental design to taste, and the principles of fine art, and its practical relation to manufacture, equally form the business of the school of Lyons."

The kind of instruction given at this school makes the study of the more elevated branches of art so common or of easy access, that there is much less pretension about French than English artists, for what many can do is of comparatively small esteem. It is considered no degradation in an artist to adopt pattern-drawing as a profession, because this pursuit is every whit as respectable as that of portrait or any other kind of painting, and is probably as well remunerated.

"The business of the pattern-designer and *metteur en carte* (putter of the design on the card) both in the same person, does not cease with the mere production of a drawing on paper; he also superintends its being set up and worked in the loom; and thus he is enabled to correct, to retouch (if I may be allowed the expression), and to finish his design. So complete is the co-operation between the designer and the pattern-weaver, that both may be said to be engaged about one object; the latter being an instrument in the hands of the former to accomplish a work of art, towards the production of which the labours of the designer really tend, a pattern wrought in silk, and not one sketched on paper.

There is no circumstance, indeed, in France, connected with the application of design, not merely to the silk manufacture, but to every branch of industry, that deserves more especial notice than the high estimation in which industrial artists are held, and the free and unrestrained exercise of their judgment and taste, which is consequently allowed to them in all matters over which their peculiar abilities ought properly to give them control. So entire is the confidence which the Lyonese manufacturer reposes in his designer, that I have been assured by the head of one of the principal houses there, that in many cases he did not see the patterns till they were produced in silk, being quite satisfied that in every matter where taste was concerned, the artist must know better than he. In short, a French pattern-designer is looked upon in his sphere precisely in the same light as a professor of fine art.

I am quite persuaded that if there is one cause more powerful than another which has contributed to retard, or which now presents an obstacle to the progress of taste in British manufacture, it is the degraded position which pattern-designers occupy—a position in which their talents find no scope for developement, and their taste and judgment as artists are set at nought. The mechanical business of copying, altering, or dovetailing patterns, already in some shape in the British or foreign market (which is all that a draftsman is now called upon to do), is neither lucrative, nor does it hold out the very smallest prospect of that kind of reputation and applause which French designers individually enjoy, and which every one knows is the most powerful motive for exertion with young artists; the consequence is, that if a youth of natural ability thinks he has any prospect whatever of succeeding in the higher walks of art, he will rather take his chance in this than submit to the thankless drudgery to which he is exposed as a pattern draftsman.

In Lyons, the commercial value of taste is reckoned so high, that when a young man displays remarkable powers, a house will admit him to a partnership, in order completely to monopolise his services. Even in general employment, a Lyonese pattern-designer in good practice realises as much as 10,000 francs per annum; which, considering the comparative value of money in Lyons and any town in England, must be reckoned a sum much beyond the conceptions of remuneration on the part of English manufacturers. But why is this? For this obvious reason: the French manufacturer incurs little or no expense for the purchase of foreign designs; he does not employ agents to obtain, at all hazards, a pattern of every new article that appears in the London or Paris market; he never suffers the loss (so frequent in this country) arising from his having manufactured the same pirated design simultaneously with three or four other houses; and therefore it is that he can afford to pay his artist highly. Though the sum he thus expends may appear large, the outlay on patterns in France is not greater than it is in England, if indeed it be so great. But the difference is this, that the money which in France is paid directly to the artist, is in England frittered away on expedients for superseding the employment of original designers;—expedients which, if law and honesty are to be taken into account, cannot be reckoned other than illegitimate, and which, if prudence, must, I fear, be thought

Digitized by Google

very short-sighted, because the great bulk of patterns executed in England according to the present system, must inevitably want the stamp of novelty and originality, which is not only the great characteristic of the French, but is really the advantage which the French manufacturer gains by paying liberally for the assistance and judgment of highly educated artists."

Mr Dyce concludes by recommending the British government to introduce into the School of Design in Somerset House, certain kinds of apparatus connected with manufacturing industry, with the view of rendering the studies of the pupils more practical; but we should doubt whether this will have any powerful effect in improving the patterns of our various manufactures. In this country, generally, the public taste is defective, and there lies the foundation of our poor patterns in all branches of art. Improve taste by introducing elementary drawing into all our schools, let there be a free and constant exhibition of works of art, and let encouragement be given to artists and designers according to merit, without regard to rank or party interest, and we shall have little to fear for the improvement of our more elegant class of manufactures. In England, fashion is often led by very vulgar circumstances, and the designer, instead of improving upon, has to follow the taste, however absurd. In France, as we learn, they manage these things better. "Design for industry," says Mr Dyce, "is not an abstract thing; it is not the business of the designer to produce good patterns for any possible condition of manufacture, but, taking it as he finds it, to bring his cultivated taste to bear on its improvement. It is the fashion of each succeeding season that he has to deal with. The practice of French manufacturers in this respect seems to me worthy of being noticed. It is, I believe, considered by them that fashion is something more than the mere caprice of the moment; and though individuals of rank or of celebrity of some kind may for a time give a particular bias to the *mode*, yet that the current of taste in the ordinary matters of life has its origin in, and takes its direction from, the general character and habits of society. Hence they say, if we refer to the history of any past age, we shall find the records of its literature and its art, and the remains of its every-day appliances of life, all partaking of some common character or sentiment. Acting on this notion, the manufacturers of France make it their business to discern accurately the characteristics of the under-current of feeling to which fashion and its changes are supposed to be due, and by this means to keep pace with people's inclinations, and even to anticipate them. 'We know,' said one of the Lyonese manufacturers to me, 'that when the fashion of this year shall have run its course, every one will have a longing for something new; yet not absolutely new, but something to which the present mode naturally tends. That something which in the world of fashion is only an indefinite sentiment, in fact, a mere predisposition, we endeavour to render palpable, to give it a strongly pronounced character, and assign it a name.'"

COOKS AND COOKERY.

Some acute and discriminate philosopher has defined man to be a "cooking animal." The full force and accuracy of this definition may not be apparent at first sight, but a moment's consideration will satisfy any one upon the subject. We cannot call man exclusively a "speaking" animal, for the parrot and the starling share with him the endowment of articulated talk. We cannot term him *par excellence* a "reasoning" animal, for the elephant and the dog, not to speak of other creatures, exhibit well-marked degrees, at least, of the faculty of ratiocination. Nor can we style him a "house-building" animal, for birds inhabit tenements of their own erection, every whit as perfect as his. As little can we say that he is the only "clothes-wearing" being, for, admitting that neither shell-fish, nor the ordinary members of the ephemeral creation, make use of what may be properly called garments, there is at least one little insect, the clothes-moth, which makes for itself a dress of wool lined with silk, as dexterously as any tailor, and wears it as gracefully as any human exquisite.* So that, after all, the definition alluded to is by no means a joke, but, in reality, the most correct that could be given. No animated creature but man, as far as we are aware, cooks its food.

This great distinctive quality has been called abundantly into exercise by mankind, at all times since the beginning of the world. It may be imagined by some people that our luxurious age is peculiarly the age of cooks, but this is very far from being the case. The Greeks and Romans carried the niceties of the culinary art to a pitch exceeding any thing thought of even by the Udes or a Carême of our day. Could either of these famous moderns entertain a higher sense of the duties and dignity of a master of their art than the Greek head cook, who thus speaks in Athenæus? The passage is translated in D'Israeli's Curiosities of Literature.

> I never enter in my kitchen, I!
> But sit apart, and in the cool direct;
> Observant of whate'er may pass within,
> The scullions' toil. I guide the mighty whole,
> Explore the causes, prophesy the dish.
> 'Tis thus I speak: "leave, leave that ponderous ham;
> Keep up the fire, and lively play the flame
> Beneath these lobster-patties; patient here,
> Fixed as a statue, skim, incessant skim.
> Steep well this small glociscus in its sauce,
> And boil that sea-dog in a cullender;
> This eel requires more salt and marjorum;
> Roast well that piece of kid on either side
> Equal; that sweet-bread boil not overmuch."
> 'Tis thus, my friend, I make the concert play.
> And then no useless dish my table crowds;
> Harmonious ranged, and consonantly just!
> As in a concert instruments resound,
> My ordered dishes in their courses chime.

Some of the great Greek cooks, of the cast of the preceding gentleman, carried their art to such perfection that they were able to serve up a whole pig, *boiled* on one side, and *roasted* on the other; and *stuffed* besides, though without visible mark of the knife upon it. The inventor of this feat was cruel enough to keep the process secret for a whole year; at length it was revealed, that he had bled the animal to death by a very small wound under the shoulder, by which he had also extracted the entrails piecemeal; that he had forced the stuffing down the throat; and that by means of barley paste he had prevented the roasting on one side, having boiled it afterwards. It is said also of these Greek cooks, that, by their saltings, picklings, and fryings, they could actually make a turnip pass for any kind of fish or flesh they chose!

One ancient epicure, by name Philoxenus, made himself famous by habituating himself to the touch and taste of water scalding hot, that he might feel the less impediment in swallowing the hottest dishes. A congenial spirit appeared in the Roman Apicius, who made a voyage to Africa, in a time of tempest, merely because he had heard that the shrimps were larger there. Finding this to be a mistake, he turned his back on Africa with contempt.

We might greatly prolong our notices of ancient cookery and epicurism, but it is our wish to leave some space for matters of more modern date. In casting our eye downwards from antiquity, we light upon one peculiarly prominent culinary figure, the famous Vatel, cook to the great Prince of Condé. Vatel was a worthy professor of his art, and profoundly sensible of its dignity and importance. His death, as recorded by Madame Sevigné, is one of the finest touches of the (it would be almost cruel to say *mock*-) heroic, that ever was perpetuated by pen or press. Louis XIV. had gone to Chantilly to visit the Condé. Vatel—whom the acute Sevigné does not hesitate to term "a man eminently distinguished for taste, and whose abilities were equal to the government of a *state*," not to speak of a kitchen—Vatel was put upon his mettle. "The king (says Sevigné) arrived on Thursday night; the walk, and the collation, which was served in a place set apart for the purpose, and strewed with jonquils, were just as they should be. Supper was served, but there was no roast meat at one or two of the tables, on account of Vatel's having been obliged to provide several dinners more than were expected. This affected his spirits, and he was heard to say several times, 'I have lost my fame! I cannot bear this disgrace!' 'My head is quite bewildered,' said he to Gourville. 'I have not had a wink of sleep these twelve nights; I wish you would assist me in giving orders. Gourville did all he could to comfort and assist him; but the failure of the roast meat (which, however, did not happen at the king's table, but at some of the other twenty-five), was always uppermost with him. Gourville mentioned it to the prince, who went directly to Vatel's apartment, and said to him, 'Every thing is extremely well conducted, Vatel; nothing could be more admirable than his majesty's supper.' 'Your highness's goodness,' replied he, 'overwhelms me; I am sensible that there was a deficiency of roast meat at two tables.' 'Not at all,' said the prince; 'do not perplex yourself, and all will go well.' Midnight came: the fireworks did not succeed; they were covered with a thick cloud; they cost sixteen thousand francs. At four o'clock in the morning, Vatel went round, and found every body asleep; he met one of the under-purveyors, who was just come in with only two loads of fish. 'What!' said he, 'is this all?' 'Yes, sir,' said the man, not knowing that Vatel had dispatched other people to all the sea-ports round. Vatel waited for some time; the other purveyors did not arrive; his head grew distracted; he thought there was no more fish to be had; he flew to Gourville. 'Sir,' said he, 'I cannot outlive this disgrace.' Gourville laughed at him; Vatel, however, went to his apartment, and setting the hilt of his sword against the door, after two ineffectual attempts, succeeded in the third, in forcing the sword through his heart. At that instant the carriers arrived with the fish; Vatel was inquired after to distribute it; they ran to his apartment, knocked at the door, but received no answer; upon which they broke it open, and found him weltering in his blood. A messenger was immediately dispatched to acquaint the prince with what had happened, who was like a man in despair. The duke wept, for his Burgundy journey depended upon Vatel. The prince related the whole affair to his majesty with an expression of great concern: it was considered as the consequence of too nice a sense of honour; some blamed, others praised him for his courage. The king said he had put off this excursion for more than five years, because he was aware that it would be attended with infinite trouble, and told the prince that he ought to have had but two tables, and not have been at the expense of so many, and declared he would never suffer him to do so again; but all this was too late for poor Vatel."

Here was indeed a man fit to be a *chef de cuisine*, as the French impressively call a culinary professor of the highest order. But more recent days have not been without his equals. "Two shall be named, pre-eminently great," Ude and Carême. Louis Eustache Ude, a Frenchman by birth, was "cook to the unfortunate Louis XVI. of France, subsequently to the Earl of Sefton, and, finally, steward to the Duke of York," as he himself tells us in his great work, entitled the "French Cook." The high value which he set upon his art may be partly gathered from the accredited story, that he left the service of the Earl of Sefton, because that nobleman's eldest son, Lord Molyneux, was said "to have *put salt* into a soup of his (the cook's) composition." "Cookery is an art (says Monsieur Ude) which requires much time, intelligence, and activity, to be acquired in perfection. Music, dancing, fencing, painting, and mechanics in general, possess professors under twenty years of age, whereas in the first line of cooking, pre-eminence never occurs under thirty. We see daily at concerts and *academies*, young men and women who display the greatest abilities; but in our line nothing but the most consummate experience can elevate a man to the rank of *chief professor*. What *science* demands more study than cookery? Why should we not be proud of our knowledge in cookery? It is the soul of festivity at all times, and to all ages. How many marriages have been the consequence of meeting at dinner! How much good fortune has been the result of a good supper!" In accordance with the spirit of these remarks, M. Ude is said to have told Sir Humphry Davy one day, "Ah, *Sromfredevi*, de Society of de Royal Institution shall not nevare be complet till dere is one chair of cookery."

Monsieur de Carême is a modern and living French cook, of perhaps still higher celebrity. He is of a house of cooks; one of his lineal ancestors, the founder of the family, having been cook to the convivial pope, Leo X.; by inventing a peculiar soup for whom, as a dish for Lent, he got the name of Jean de Carême (Jack-a-Lent). The descendant of Jack-a-Lent is *chef de cuisine* to the millionary Baron de Rothschild. As he grew up, his hereditary talents gradually developed themselves, and he became so greatly renowned over all Europe, that the Emperor of Russia and various other sovereigns sought his services. He accepted an offer from George IV., then regent, but remained only eight months in the English prince's household, declaring as he left it, according to report, that "it was a boorish establishment." He certainly did not quit England because due honour was not paid to his talents, for the great of London did not disdain to pay immense prices for his second-hand patties after they had made their appearance at the regent's table. Employed finally by the Baron de Rothschild (brother of the great London Rothschild), Carême received from him an allowance greater than monarchs could afford. Lady Morgan, in her "France in 1829–30," has become the recorder of this culinary artist's merits, and the fussy reverence, but slightly hid under a tone of exaggeration and banter, with which she speaks of him, is most amusing. The "immortal Carême," such "philosophers as Carême," a "man at the head of his class," this "extraordinary and celebrated person"—such are the appropriate terms which she employs in mentioning him. She was asked to Rothschild's to dinner. Previously to this time, "I had no experience," says she, "of the works of Carême. I had yet to judge (in his own words) of those meliorations in his art, produced by the 'intellectual faculties of a renowned practitioner.' I did not hear the announcement of dinner without emotion. To do justice to the science and research of a dinner so served, would require a knowledge of the art equal to that which produced it. Distillations of the most delicate viands, extracted in 'silver dews,' with chemical precision,

> 'On tepid clouds of rising steam,'

formed the basis of all. Every meat preserved its own natural aroma; every vegetable its own shade of verdure. With less genius than went to the composition of this dinner, men have written epic poems; and if crowns were distributed to cooks as to actors, the wreath of Pasta or Sontag, divine as *they* are, never were more fairly won than the laurel which should have graced the brow of Carême, for this specimen of the *intellectual perfection* of an art, the standard and gauge of modern civilisation! On good cookery depends good health; on good health depends the permanence of a good organisation; and on these the whole excellence in the structure of human society.

As I was seated next to Monsieur Rothschild, I took occasion to insinuate, after the soup (for who would utter a word before?), that I was not wholly unworthy of a place at a table served by Carême, as I was already well acquainted, theoretically, with his merits. 'Ah, well,' said Monsieur Rothschild, laughing, 'he, on his side, has also relished your works, and here is a proof of it.' I really blush, like Sterne's accusing spirit, as I give in the fact; but he pointed to a column of the most ingenious confectionery architecture, on which my name was inscribed in spun sugar. *My* name written in sugar! Ye Quarterlys and Blackwoods, and thou, false and faithless Westminster! Ye who have never traced my proscribed name but in gall! think of 'Lady Morgan' in sugar!

All I could do under my triumphant emotion I did. I begged to be introduced to the celebrated and flattering artist, and promised, should I ever again

trouble the public with my idleness, to devote a tributary page to his genius, and to my sense of his merits, literary and culinary. [The cook had written a work on his science.] Carême was sent for after coffee, and was presented to me in the vestibule of the chateau by his master. He was a well-bred gentleman, perfectly free from pedantry; and when we had mutually complimented each other on our various works, he bowed himself out, and *got into his carriage*, which was waiting to take him to Paris."

This extract forms the climax of our article. It is impossible for us, by any further remarks or quotations, to place cooks and cookery in a more elevated light than has been here done by Lady Morgan, who has shown herself truly worthy of her great subject. So we leave the illustrious Carême to command the "aids of his staff," to loll in "his carriage," and to enjoy "his box at the opera," believing him to be, beyond question, superlatively worthy of all these luxuries. For the straggling character, generally, of these our anecdotes, the reader must pardon us, for we really had no other object in view at the outset than to string together a few such loose illustrations of "man as a cooking animal." We have merely to remark in conclusion, that that definition of man applies universally. All men cook, and enjoy cookery —the poor, as well as the employers of Udes and Carêmes. We never shall forget the earnestness and gusto with which an ancient shoemaker once on a time gave utterance to the following saying. He had married a woman who had long been cook in a wealthy family, and was asked by a friend soon after the nuptials how he was pleased with his spouse. "Eh, man," says he in reply, "she is a *prime* ane! Dashit, I believe she could make a *stew* out o' *bend-leather*, and a *hashie* out o' *insoles!*"

TRAITS OF LONGEVITY.

THERE are certain constitutions formed by nature so robust, with all the animal organs so perfect, that they endure to a great age, even in defiance of all rules of regimen. They can bear both excess and privation. A mode of living that would be too rich and stimulating for ordinary frames, only conduces to their perfect health and vigour, while out of poor materials their vigorous digestion can concoct a wholesome nourishment, on which weaker stomachs would be thrown into disease and atrophy. It does not follow from this, however, that a strict regimen is useless, or that excess to the generality of men is not highly injurious. A happily constituted temperament may be independent of rules, and may resist the effects of their infringement; while, on the other hand, the observance of rules of sobriety and moderation will have a decided and wonderful effect on those constitutions in which there are such weaknesses as produce the tendency to disease. Generally speaking, too, it will be found that the most perfect temperaments are less disposed to excess or irregularities than feebler ones. There is a happy condition of animal existence in which the enjoyment of health, of simple fare, and of the free air of heaven, are all the stimulants necessary, while a craving for undue excitement is too frequently the characteristic of an irregular physical as well as mental constitution.

The effect of regimen on health and longevity is no where more strikingly exhibited than in the celebrated example of Cornaro. Previous to detailing this case, however, it must be remarked, that Cornaro's constitution appears to have been naturally of a peculiar kind, so that the strict regimen which he practised is not intended to be held up as a model for all ordinary livers; his case affords, however, an instructive example of the effects of diet and regimen, both on the body and the mind, and in this view cannot be too frequently appealed to.

Lewis Cornaro was of a noble Venetian family, and was born about the middle of the fifteenth century. He appears originally to have been of an ardent, sanguine disposition, fond of pleasure and enjoyment, and of excitable passions. This temperament overhurried him into a career of dissipation and sensual enjoyment, which he pursued till his thirty-fifth year. About this period his constitution gave way; pains in his sides and stomach tormented him; symptoms of gout made their appearance, with irregular appetite, thirst, and a slow consuming fever. In this wretched condition he struggled on for some time, trying the effect of medicines without any benefit, while his constitution sank more and more, till at last his physicians declared that nothing could rescue him but a total change of his mode of life, and a rigid restriction of his diet and regimen. Cornaro had sufficient strength of mind, and firmness of purpose, at last to adopt this advice; he restricted his diet to the simplest fare, and took of this a very moderate allowance—renounced his irregular dissipated life—avoided excess of heat, cold, and extraordinary fatigue—took timely repose—and, in short, observed a strict and proper regimen. In a very short time he was astonished at the beneficial change which took place in his system, and in less than a year he found his health completely restored. He ever after most rigidly adhered to his spare diet, which amounted to twelve ounces in all daily, and consisted of bread, meat of the simplest kind, yolk of egg, and soup, with fourteen ounces of a mild wine. On this allowance he enjoyed perfect bodily health and vigour, and a freedom from all physical ailments. His mind, too, seemed to share in the beneficial regimen. His passions became less irritable his spirits more buoyant, and his judgment more cool and considerate. Not only did this regimen procure him the enjoyment of excellent health, but on two trying occasions it enabled him to sustain disasters which have proved fatal to many others. While a grievous and protracted lawsuit was carried on against him by powerful rivals, by which his patrimonial estate was imminently endangered, joined to the chagrin of being deprived of his nobility through the bad conduct of some of his relations, he remained cool and undisturbed till an honourable decision at last was given in his favour, whereas his brother and some other relations sank under the persecution and died. On another occasion, he was thrown from his carriage, and besides being much bruised, had his leg and arm dislocated. The most serious apprehensions for his life were entertained by his friends and physicians, and the most active treatment was urged upon him; but, confident in his own constitution, he would not even allow bleeding, or other evacuations, and by the most simple means recovered in a very short time.

"Moreover, it is known in what manner I pass my time so as not to find life a burthen, seeing I can contrive to spend every hour of it with the greatest delight and pleasure, having frequent opportunities of conversing with many honourable gentlemen. Then, when I cannot enjoy their conversation, I betake myself to the reading of some good book. When I have read as much as I like, I write, endeavouring in this as in every thing else to be of service to others to the utmost of my power.

At the same seasons every year I revisit some of the neighbouring cities, and see such of my friends as live there, taking the greatest pleasure in their company and conversation, and by their means I also enjoy the conversation of other men of parts who live in the same place, such as architects, painters, sculptors, musicians, and husbandmen. But what delights me most in these journies, is the contemplation of the scenery and other beauties of the places I pass through."

At the age of seventy-eight, in compliance with the entreaties of his friends, he increased his allowance both of solid and liquid food by the addition of four ounces daily; even this slight change he found had such an effect upon him, that in eight days, from his usual cheerful active habits, he became peevish and melancholy, so that nothing could please him, and he was so strangely disposed, that he knew not what to say to others, or what to do with himself. On the twelfth day he was attacked with a most violent pain in the side, which continued for many hours, and was succeeded by a fever, which did not leave him for a month, rendering him restless and sleepless, and reducing him to a mere skeleton. After this he attempted no further change in his usual diet, and enjoyed uninterrupted good health till his death.

Although he married early, he was pretty far advanced in years before a child was born to him. His anxious wish for a successor to his ample possessions was at last realised in the birth of a daughter. This, his only child, he lived to see become a matron, and die mother of eight sons and three daughters. It is delightful to read in the treatises which he has left to posterity the manner in which he passed his old age. He seems to have been one of those few beings especially favoured by heaven, and by his practice so worthy of its favour, as if in order to show to frail mortals what a beautiful thing a good life is even on this earth. Born in a genial climate, the possessor of an ample estate, of an active firm mind and cheerful temperament, a lover of his country, of his species, and of his God—rescued from a career of sinful folly, he had his life extended to one hundred years, and spent an active existence in the improvement of his estate, in services of the community, in the pleasures of literature, and in the bosom of his family—an old man, vigorous, cheerful, and playful to the last, among a happy group of playful grandchildren.

With all the excusable garrulity of an octogenarian, he thus tells us of his habits. "I will now give an account of my recreations, and the relish which I find at this stage of life, in order to convince the public that the state I have now attained to is by no means death, but real life; such a life as by many is deemed happy, since it abounds with all the happiness which can be enjoyed in this world. And this testimony they will give in the first place, because they see, and not without the greatest amazement, the good state of health and spirits which I enjoy—how I mount my horse without any assistance or advantage of situation, and how I not only ascend a single flight of stairs, but climb up a hill from bottom to top. Then how gay, pleasant, and good-humoured I am!—how free from every perturbation of mind, and every disagreeable thought!—the plains, the hills, the rivers, and fountains, amid which are situated many fine houses and gardens. Nor am I prevented from these enjoyments by any decay of my senses; they being all, thank God, in their highest perfection, particularly my palate, which now relishes better the simple fare I eat wherever I may be, than it formerly did the most delicate dishes when I led an irregular life."

But his enjoyments are not all personal or selfish; he enters warmly into the agricultural improvements of his country—the draining of marshes, and the melioration of the soil; and looks with anxious solicitude to the completion of extensive improvements of the port, as likely to contribute to the commercial welfare of the state, of whose interests he speaks with all the warmth and ardour of a true patriot.

Like all benignant characters, the playful innocence of youth had peculiar charms for him. He thus introduces us into his domestic evening circle:—"That no comfort might be wanting to the fulness of my years, whereby my great age may be rendered less irksome, or rather the number of my enjoyments increased, I have the additional comfort of seeing a kind of immortality in a succession of descendants; for as often as I return home, I find there before me, not one or two, but eleven grandchildren, the oldest of them eighteen, and the youngest two; all the offspring of one father and one mother—all blessed with the best of health—and, by what as yet appears, fond of learning, and of good parts and morals. Some of the youngest I always play with; and, indeed, children from three to five are only fit for play. Those above that age I make companions of; and as nature has bestowed very fine voices upon them, I amuse myself besides with seeing and hearing them sing and play on various instruments. Nay, I sing myself, as I have a better voice now, and a clearer and louder pipe, than at any other period of life. Such are the recreations of my old age."

Thus the good old man continued to enjoy life till he passed his hundredth year. He slept away without disease, or pain, or agony, in the spring of 1566.

The history of John Macalpin, a Highland drover, will form a good companion to that of Cornaro, as illustrative of the effects of temperance under a severer climate, and in a different station of life from that of the noble Italian.

John Macalpin was a native of Jura, one of the Hebridian islands. He lived to the age of 119 years, and retained all his faculties till his death, which took place in the year 1745. When a boy, he was rather of slow growth, and was affected with boils and eruptions of the skin. His father died and left him in comfortable circumstances at the age of eighteen. For some years the nature of his business led him into dissipated company, where he was accustomed to drink hard, sit up late, and lead an irregular life. This he continued till he was about twenty-four years of age, when, in leaping out of a boat, he fell, and struck his foot against the ground. The contusion degenerated into an ulcer, which continued, under neglect or bad treatment, to increase for two years. During this period he paid no regard to his diet, eating salt meat, fish, or any thing that came in the way, and drinking frequently to excess. The consequence was, that his constitution gave way, and the ulcer continued to increase. A medical friend to whom he applied, in order to compel him to give over his habits of life, took him to live at his house during the period of cure; and by enforcing a strict regimen to his patient, brought about a complete cure in the course of three months. Macalpin, on his return home, was so impressed with the beneficent effects of temperance, both for his comfort and health, that he ever afterwards practised it, and in consequence enjoyed uninterrupted good health for the remainder of his long life. As illustrative of local manners, it may not be uninteresting to give a detail of his mode of living.

It was the custom at that time over all the Highlands, and especially among the common people of the isles, to make but two meals a-day. They breakfasted about nine or ten in the morning, and supped about six or seven; this last being the principal meal. Macalpin followed this custom; he went to bed with the sun, and rose with the lark. If he went out as soon as he got up, and the morning appeared foggy, he generally ate a mouthful of bread, and no more till breakfast time. His constant breakfast was bread, butter, and cheese, or eggs, with gruel made of half water half milk. His supper was fish or flesh, for the most part boiled. The flesh was boiled with greens or roots, the soup of which was thickened with a little oatmeal, which he drank plentifully. His fish were generally boiled in as much water as simply covered them; this water was thickened into a soup with a little meal and milk, and eaten along with all white fish. His general rule was to rise from table with an appetite to eat more, and the liquids he used were always at least four times the quantity of the solids. If he used harder exercise at one time than another, he ate a little more than usual; but at no time did he go to excess, or eat of but one sort of food at a meal. He never drank water till it was previously boiled, and poured over a toast of bread or a little oatmeal, and afterwards allowed to cool. This he used for his constant drink between meals. His bread was for the most part made of barley meal, but he also ate oat cake when the others could not be procured. He never indulged in fermented liquors of any kind, except on two occasions during the year, and these were at the terms of Whitsunday and Martinmas, when he went to pay his rent to the landlord, and then only very sparingly. Drams he forswore; but if obliged to be long in the cold, or exposed to wet, he took the yolk of an egg, a little honey, and a glass of whisky mixed together, and drank it off; but this was only done on very rare occasions. He used no snuff or tobacco in any shape. He took a great deal of exercise, was of an active, cheerful, and intelligent mind, free from passion, but, when roused, was by no means devoid of proper manly courage. In general, his manner was mild and forbearing, and free of the irascibility of an excited temperament.

If at any time he felt his system in the least deranged, he had recourse to abstinence, and the pro-

Digitized by Google

motion of a free perspiration; for the latter purpose he used at bed-time a warm drink composed of thin oatmeal flummery, sweetened with honey, to which was added a little butter. He wore the usual clothing of the country, a kilt or belted plaid, with a piece of flannel over the region of his stomach. In going out in the morning, he went through the first river or pool which came in his way, and thus continued all day with wet feet, very frequently till he went to bed. He remained to the last free from physical disease; but grief for some friends who fell in the battle of Culloden, was thought to have brought on his death, which he met with Christian fortitude and resignation, at the age of a hundred and nineteen years.

THE SLAVE-MARKET AT CAIRO.

Mr Wilde, from whose "Travels" we have already made several extracts, gives the following account of the slave-market at Cairo, which he visited after the mad-house:—

"We next visited the slave-market, which is here of great extent. It was remarkable that as a seller of bread sat at the gate of the mad-house, the shop adjoining the gate of the slave-market was occupied by a vender of koorbags, or Arab whips. Within was a large open court, surrounded by a number of small dark chambers, which rose in terraces around it; these contained the better class of slaves, who were all Abyssinian girls, from ten to eighteen years of age, with a yellowish olive complexion, long straight noses, handsome features, and particularly melting black eyes, the hair long and black, and the lips somewhat thicker than those of persons of a similar cast of countenance, which, naturally melancholy in this race, was rendered more so by their present sad condition. All were decently dressed, many decorated with silver anklets and bracelets, and some few had nose rings. Several were in tears, and all hung down their heads, and appeared ashamed of their degraded, hopeless situation, but brightened into a smile on our offering a few piasters. Most of these girls have been either kidnapped by the slave-dealers, or sold by their own friends for a few trinkets or glass beads; large quantities of the latter are manufactured in Europe and sent here in packages, several of which I met at Atfé. Their eyes were blackened like the Mahommedan females, and many were remarkable for their tall, light, and elegant figures.

In the centre of the court were arranged a number of mats, divided into compartments, on which were squatted whole families of negroes, principally from Nubia and Dongola, and who were for the most part captives, taken in war by some neighbouring tribes. The majority of these were females from eight to twelve years of age, who are purchased for household servants. Although nearly naked, the young Nubian had still the inherent love of decoration, and strings of blue beads adorned the necks of many who could not boast even a chemise. They were all tattooed in various places about the head and breast, each according to the manner of their tribe, and their woolly pates dressed in plats about the size of whip-cord, and well greased with rancid lard, which hung in bunches over both ears. These young creatures appeared perfectly unconscious of their state, and, as far as appearance went, were happy. In intermediate places sat the different slave merchants, Turks and Arabs; and Bedawees, stalking about in their Burnooses, and buyers, occasionally pointing out the slave they wished to purchase, who were called by the owner and carefully examined; if they had covering on, it was removed, and they were made to exhibit their shapes and paces like a horse at an auction mart. These young negresses can be purchased for from thirty to forty dollars; the Abyssinians go as high as a hundred. These slaves so soon adopt the manners and religion of their masters, that I have known a girl, when purchased by a Mahommedan, lift up her *only* covering to shade her face while following him from the slave-market!

During an early morning visit I witnessed a very extraordinary scene here; all the negresses, young and old, had ranged themselves round the walls of the upper terraces, and were greasing their bodies and heads, which shone lustrously in the warm sunshine; they reminded me of so many cormorants pluming themselves upon a rock after their evening's meal. As manual field labour is seldom or never accomplished by slaves in this country, there are few adult males brought down, and the boys are principally used as grooms and confidential servants. There is a white slave market, adjoining this, where Georgians and Circassians are kept, but no European is allowed to enter.

Having thus described an eastern slave-market, let us inquire what slavery is in the east. The very term is, no doubt, one from which human nature shrinks with repugnance; but it is not here 'the soul-debasing task-work of a servile bondage' as among Christian nations, and, apart from the miseries of separation from friends and country, it is an undoubted change to many for the *better*.

The worst part is the voyage down the Nile, or the passage across the desert, where they are subjected to much hardship and villany from the slave-dealers. Many of the male slaves in the east become officers, and rise to places of trust in the state, and numbers obtain their freedom in a few years. True it is that the master can kill his slave, but few are so foolish as to incur such a personal loss. They are far better fed, clothed, and taken care of, than free servants at Cairo, whom they despise and look upon as inferiors, often boasting, by saying 'they were slaves and not servants.' Less manual labour is required of them than of the freemen, and all are acquainted with the political importance a race of slaves now extinct once assumed in Egypt. As regards the female slaves, I before stated that the Nubians were all used as under-servants and attendants upon the ladies of the harem; but the Abyssinians, for whom, from their interesting appearance, and somewhat greater advance in civilisation, our sympathies would be more excited, are generally purchased as concubines, a state in the present condition of morality in Egypt often preferable to that of wife, who can divorce herself or be divorced for any trifle, while the other can demand or insist on a proper allowance. The children of these women are free, and they themselves are generally made so on the birth of the first-born, especially if it be a son; and numbers are married to their masters, and become not only the most affectionate, but the most faithful women in the community.

Compare this with Christian slavery—compare it likewise with the condition of those people in their native state, and we must acknowledge it an improvement of their condition. It was the slavery of the primitive Hebrew nations, allowed by Scripture, and practised by the patriarchs, but which refinement and Christianity, the well-being of society, and the respect which man owes his fellow, alike forbid."

An American lady, who has lately written a narrative of her journey in Egypt,* gives a similar description of the slave-market at Cairo, with the additional and characteristic particular, that whips made of the raw and thick hide of the hippopotamus are sold in the place for the convenience of slave-buyers. "The gentlemen (says she) purchased two or three bundles of them for the American market—for *riding whips*, however." This lady does not make a single remark, either of commiseration for the numbers of unhappy creatures of her own sex, and of all colours from pure white to pure black, whom she saw exposed for sale like cattle, or against the atrocity of slave-dealing generally. Her jocularity respecting the destination of the whips purchased by her countrymen, marks a low tone of sentiment.

THE EXILES.†

In 1793, M. de Talleyrand was in Boston. One day, whilst crossing the Market-place, he was compelled to stop by a long row of waggons, all laden with vegetables. The wily courtier, generally so dead to emotion, could not but look with a kind of pleasure at these waggons, and the little waggoners, who by the bye were young and pretty countrywomen. Suddenly the vehicles came to a stand, and the eyes of M. de Talleyrand chanced to rest upon one of the young women who appeared more lovely and graceful than the others. An exclamation escaped from his lips—it attracted the attention of the fair one, whose country dress and large hat bespoke daily visits to the market, as she beheld the astonished Talleyrand, whom she recognised immediately, burst out laughing.

"What! is it you?" exclaimed she.

"Yes, indeed, it is I. But you, what are you doing here?"

"I," said the young woman, "I am waiting for my turn to pass on. I am going to sell my greens and vegetables at the market."

At that moment the waggons began to move along; she of the straw hat applied the whip to her horse, told M. de Talleyrand the name of the village where she was living, requesting him earnestly to come and see her, disappeared, and left him as if riveted on the spot by this strange apparition.

Who was this young market-woman? Madame la Comtesse de la Tour-du-Pin (Mademoiselle de Dillon), the most elegant among the ladies of the court of Louis XVI., king of France, and whose moral and intellectual worth had shone with so dazzling a lustre in the society of her numerous friends and admirers. At the time when the French nobility emigrated, she was young, lively, endowed with the most remarkable talents, and like all the ladies who held a rank at the court, had only had time to attend to such duties as belonged to her highly fashionable and courtly life.

Let any one fancy the sufferings and agony of that woman, born in the lap of wealth, and who had breathed nothing but perfumes under the gilded ceilings of the royal palace of Versailles, when all at once she found herself surrounded with blood and massacres, and saw every kind of danger besetting her young and beloved husband, and her infant child.

They succeeded in flying from France. It was their good fortune to escape from the bloody land where Robespierre and his associates were busy at the work of death. Alas! in those times of terror the poor children themselves abandoned with joy the parental roof, for no hiding-place was secure against the vigilant eye of those monsters who thirsted for innocent blood.

The fugitives landed in America, and first went to Boston, where they found a retreat. But what a change for the young, pretty, and fashionable lady, spoiled from infancy by loud and continual praises of her beauty and talents!

Monsieur de la Tour-du-Pin was extravagantly fond of his wife. At the court of France he had seen her, with the proud eye of a husband, the object of general admiration; indeed, her conduct had always been virtuous and exemplary; but now in a foreign land, and among unsophisticated republicans (1793), what was the use of courtly refinements!

Happy as he was in seeing her escape from all the perils he had dreaded on her own account, still he could not but deplore the future lot of the wife of his bosom. However, with the prudent foresight of a good father and a kind husband, he nerved himself against despair, and exerted himself to render their condition less miserable than that of many emigrants who were starving when the little money they had brought over with them had been exhausted. Not a word of English did he know, but his wife spoke it fluently, and admirably well.

They boarded at Mrs Muller's, a good-natured, notable woman, who on every occasion evinced the greatest respect and admiration for her fair boarder; yet M. de la Tour-du-Pin was in constant dread lest the conversation of that good, plain, and well-meaning woman, might be the cause of great ennui to his lady. What a contrast with the society of such gentlemen as M. de Norbonne, M. de Talleyrand, and the high-minded and polished nobility of France!

At last came the day when the fugitive family left the boarding-house of Mrs Muller to go and inhabit their little cottage, when they were to be at last exempt from want, with an only servant, a negro, a kind of Jack-o'-all-trades, namely, gardener, footman, and cook. The last function M. de la Tour-du-Pin dreaded most of all to see him undertake.

It was almost dinner-time. The poor emigrant went into his little garden to gather some fruit, and tarried as long as possible. On his return home his wife was absent; looking for her, he entered the kitchen, and saw a young countrywoman, who, with her back to the door, was kneading dough; her arms, of snowy whiteness, were bare to the elbows. M. de la Tour-du-Pin started; the young woman turned round. It was his beloved wife, who had exchanged her muslins and silk for a country dress, not as for a fancy ball, but to play the part of a real farmer's wife. At the sight of her husband her cheeks crimsoned, and she joined her hands in a supplicating manner. "Oh! my love," she said, "do not laugh at me. I am as expert as Mrs Muller."

Too full of emotion to speak, he clasped her to his bosom, and kissed her fervently. From his inquiries he learned that when he thought her given up to despair, she had employed her time more usefully for their future happiness. She had taken lessons from Mrs Muller and her servants, and after six months had become skilful in the culinary art, a thorough housekeeper, discovering her angelic nature and admirable fortitude.

"Dearest," continued she, "if you knew how easy it is. *We*, in a moment, understand what would cost a countrywoman sometimes one or two years. Now, we shall be happy—you will no longer be afraid of ennui for me, nor I of doubts about my abilities, of which I will give you many proofs," said she, looking with a bewitching smile at him. "Come, come, you promised us a salad, and I am going to bake for to-morrow; the oven is hot. To-day the bread of the town will do—but, oh!—henceforward leave it to me."

From that moment Madame de la Tour-du-Pin kept her word: she insisted on going herself to Boston to sell her vegetables and cream cheeses. It was on such an errand to town that M. de Talleyrand met her. The day after, he went to pay her a visit, and found her in the poultry-yard, surrounded by a host of fowls, hungry chicks, and pigeons.

She was all that she had promised to be. Besides, her health had been so much benefited, that she seemed less fatigued by the house-work than if she had attended the balls of the winter. Her beauty, which had been remarkable in the gorgeous palace of Versailles, was dazzling in her cottage in the new world. M. de Talleyrand said so to her.

"Indeed!" replied she with *naïveté*; "indeed, do you think so? I am delighted to hear it. A woman is always and every where proud of her personal attractions."

At that moment the black servant bolted into the drawing-room, holding in his hand his jacket with a long rent in the back. "Missis, him jacket torn; please mend him." She immediately took a needle, repaired Gullah's jacket, and continued the conversation with a charming simplicity.

This little adventure left a deep impression on the mind of M. de Talleyrand, who used to relate it with that tone of voice peculiar to his narrations.

VALUE OF KEEPING SILENCE.

Silence does not always mark wisdom. Coleridge once dined in company with a person who listened to him and said nothing for a long while; but he nodded his head, and Coleridge thought him intelligent. At length, towards the end of the dinner, some apple dumplings were placed on the table, and the listener had no sooner seen them, than he burst forth, "Them's the jockies for me!" Coleridge adds, "I wish Spurzheim could have examined the fellow's head."—*Table Anecdotes.*

CRUELTY TO ANIMALS.

THE present law against cruelty to animals, which an effort is now making to extend to Scotland, is very defective, and, upon the whole, from laxity of administration, has been of little practical use in the object required. One of its most marked deficiencies is, that it affords no protection to any but domestic animals. You might torture a monkey, a bear, or any other foreign beast, or any wild animal, and the law could not interfere. This defect is strikingly manifested in the following occurrence, communicated to us by a gentleman resident in an English provincial town :—

"The case of cruelty to which I allude, occurred at one of the customary hirings for farm-servants, held recently in a country town in England, which had attracted, among many other disreputable characters, the keepers of three small caravans, containing a few of the more common wild animals, and some other 'sights.' About noon, when the town was most densely thronged by the people attending the fair, an individual attached to one of those caravans brought out into the market-place a young bear, and began to exhibit him in the midst of the crowd, and to torture him in a variety of cruel ways. He had, for example, a rope fastened round the neck of the bear, with which he pulled him from side to side, and round about, with great force and rudeness. The object of the man seemed not to exhibit any tricks which the bear was able to perform, but to show the bystanders the perfect command which he himself had over him. In short, he wished to make himself appear a very Amburgh before the country folks. At length he inflicted an act of torture upon the poor animal, at the sight of which I felt greatly enraged. He seized the bear (which was a small one, and apparently quite young) with both hands behind the two fore legs, and, lifting him up, held him suspended in the air so long as he was able to sustain his weight, when he dashed him to the ground with all his strength. This he repeated two or three times whilst I was present; and when the bear growled, as he occasionally did, at this treatment, he was rewarded with a kick or a cuff from his unfeeling master.

Indignant at this barbarous treatment of the poor bear, and knowing that a law existed for the preventing and punishing cruelty towards animals, but ignorant, at that time, of its details, I immediately began a search for the act of parliament, for the purpose of perusing it, determined to have the offender called upon to answer for his conduct before the municipal authorities, if I could legally do so. I found the act to be the 5th and 6th William IV. cap. 59, and that it contained the following section, under which I, in the first instance, imagined I should have been able to convict the master of the bear :—'That if any person shall, from and after the passing of this act, wantonly and cruelly beat, ill-treat, abuse, or torture any horse, mare, gelding, bull, ox, cow, heifer, steer, mule, ass, sheep, lamb, dog, or any other cattle or domestic animal, or if any person who shall drive any cattle or other animal, shall, by negligence or ill usage in the driving thereof, be the means whereby any mischief, damage, or injury, shall be done to any such cattle or other animal, every such offender, being convicted of any or either of the said offences before any one justice of the peace for the city, town, or county in which any such offence shall have been committed, shall for every such offence forfeit and pay (over and above the amount of the damage or injury (if any) done thereby, which damage or injury shall and may be ascertained and determined by such justice) such a sum of money not exceeding 40s., nor less than 5s., with costs, as to such justice shall seem meet; or the offender shall, in default of payment, be committed to the common jail or house of correction for the city, town, or county in which such offence shall have been committed, there to be imprisoned for any time not exceeding fourteen days.'

I made application to the mayor of the town, under this clause, for a summons to bring the offender before him, on the charge of cruelty which I meant to prefer against him. The mayor referred me to his town clerk to have the summons prepared; the latter, however, was of opinion, on reading over the above section of the act of parliament, that the mayor could not convict the master of the bear, inasmuch as a bear was not a *domestic* animal, and could not, therefore, come within the meaning of the words of the act—those words being, '*or* any other cattle or *domestic animal*.' In these circumstances I deemed it prudent to abandon the charge against the showman. The mayor, however, felt it his duty to see and reprimand him, and pointed out to him the extreme cruelty of the kind of treatment towards his bear of which he had been guilty."

Now, the defect or fault in the act of parliament in question consists in not affording to wild animals brought into this country and tamed, and exhibited for purposes of gain, any protection against unnecessary cruelty or torture of many kinds. The law, it is true, shields such animals against one species of torture, and that is *fighting* or *baiting* them, but from no other: they may be abused and ill treated in a thousand other ways, by unfeeling keepers, as was the poor bear in the case above related, and their persecutors shall go unpunished. Their friends are utterly unable to procure them any redress or protection from the law, as it now stands, however anxious they may be to befriend them. Surely this ought not to be. Whilst these animals roam at large in their own native wilds, they need no such protection, but in this country their condition is widely different. Here they live in an unnatural and artificial state, which must be sufficiently painful and irritating to them of itself; and, surely, for this reason, if for no other, they ought not to be denied that protection against unnecessary cruelty or harsh treatment which the laws of this country, in a spirit of merciful consideration and benevolence, have extended to every other domestic animal.

We subjoin the following abstract of the existing law: perhaps it may be the means of preventing cruelty in those cases in which it is found to apply. The attention of magistrates in England is respectfully drawn to the subject.

The act now in force for the prevention of cruelty to animals is the 5th and 6th William IV. chapter 59. It is entitled "An act to consolidate and amend the several laws relating to the cruel and improper treatment of animals, and the mischiefs arising from the driving of cattle, and to make other provisions in regard thereto."

The following is a short abstract of its principal provisions :—

1. The act 3 George IV. chapter 71, a former act to prevent the cruel and improper treatment of cattle, and so much of the 3d William IV. chapter 19, as made it penal to fight or bait bears or other animals in and about the metropolis, is repealed.

2. Any person wantonly and cruelly beating, ill treating, abusing, or torturing any horse, mare, gelding, bull, ox, cow, heifer, steer, calf, mule, ass, sheep, lamb, dog, or any other cattle or domestic animal, or improperly driving the same, whereby any mischief shall be done, shall, upon conviction before any one justice of the peace for the city, town, or county in which any such offence shall be committed, be fined in a sum of money not exceeding 40s., nor less than 5s., with costs, or, in default of payment thereof, be committed to prison for a term not exceeding fourteen days.

3. Persons keeping pits, houses, or grounds, for the purpose of running, baiting, or fighting any bull, bear, badger, dog, or other animal (whether of domestic or wild nature or kind), or for cock-fighting, to be liable in a penalty not exceeding L.5, nor less than 10s., for every day in which they shall so use any such pit, &c. for any of these purposes. The person who shall be the manager of such pit, &c., or who shall receive any money for the admission of any person thereto, to be deemed the keeper thereof.

4. Parties impounding cattle to provide them with sufficient food; and they are empowered to recover from the owner thereof double the full value of the food so supplied to them, before a justice of the peace within whose jurisdiction such cattle shall have been impounded.

Section 8 requires that horses, intended for slaughter, be slaughtered within three days after purchase, and in the meantime to be provided with food.

The remainder of the act, which it is not necessary to notice at length, provides for the more easy and effectual apprehension of offenders against its provisions. Any constable, or any other peace-officer, is authorised and required to seize and apprehend an offender, and take him before a justice of the peace within whose jurisdiction the offence is committed, without any other authority or warrant than the information laid by some individual (who is required to give his name) of the offence having been committed.

THE FEMALE CONVICT TO HER INFANT.

BY THE REV. THOMAS DALE.

Oh, sleep not, my babe, for the morn of to-morrow
Shall soothe me to slumber more tranquil than thine;
The dark grave shall shield me from shame and from sorrow,
Though the deeds and the gloom of the guilty are mine.
Not long shall the arm of affection enfold thee;
Not long shalt thou hang on thy mother's fond breast;
And who with the eye of delight shall behold thee,
And watch thee, and guard thee, when I am at rest?

And yet it doth grieve me to wake thee, my dearest,
The pangs of thy desolate mother to see;
Thou wilt weep when the clank of my cold chain thou hearest,
And none but the guilty should mourn over me.
And yet I *must* wake thee—for while thou art weeping,
To calm thee, I stifle my tears for a while;
But thou smilest in thy dreams, while thus placidly sleeping,
And oh! how it wounds me to gaze on thy smile!

Alas! my sweet babe, with what pride had I press'd thee
To the bosom that now throbs with terror and shame,
If the pure tie of virtuous affection had bless'd thee,
And hail'd thee the heir of thy father's high name!
But now—with remorse that avails not—I mourn thee,
Forsaken and friendless, as soon thou wilt be,
In a world, if it cannot betray, that will scorn thee—
Avenging the guilt of thy mother on thee!

And when the dark thought of my fate shall awaken
The deep blush of shame on thy innocent cheek;
When by all, but the God of the Orphan, forsaken,
A home and a father in vain thou shalt seek;
I know that the base world will seek to deceive thee,
With falsehood like that which thy mother beguiled;
Yet lost and degraded—to whom can I leave thee?
O, God of the Fatherless! pity my child!

—*Readings in Poetry.*

MR ABERNETHY—ANECDOTES.

THE late Mr Abernethy, whose eccentricities as a surgeon in London are well known, often amused his class of medical students with anecdotes bearing on the subjects of his lectures. One day, "in speaking of the mode of reducing dislocations of the jaw, Abernethy observed, 'Be it known to you, people who have once dislocated the jaw, are very often likely to do it again. There was a major in the army, who had the misfortune of frequently dislocating his jaw, and it was an infirmity he cared very little about, for he was generally moving about with his regiment, and when he put it out, the regimental surgeon put it in again. But it happened that on one occasion he was fourteen or fifteen miles from where the regiment was quartered, dining with a gentleman, and being rather merry after dinner, laughing heartily, his jaw slipped out; his mouth, of course, remained wide open, and it was impossible to close it while the condyles remained out of their sockets. Not being able to close his mouth, articulation was impossible. Well, but he made an inarticulate noise, and the host being surprised, considered that there was something wrong with him, and sent for a medical man, residing in the neighbourhood, whom, if you please, we will call, for the present, the village apothecary. The apothecary made his appearance, looking as grave as any Methodist parson, and after examining the poor major, pronounced, in an oracular tone, that there was something the matter with him, and that there was something the matter with the jaw; and that, in fact, it was dislocated; and, accordingly, he began to *pull* the jaw, for the purpose of putting it in its proper place. The officer, knowing the simplicity of the operation, and how it ought to be done, was so enraged that a man should be so presumptuous as to put a pestle and mortar over his door, and yet not know how to reduce a simple dislocation of the jaw, that he vented his rage in a most furious, but in a very inarticulate manner. The learned apothecary took it into his head that the infuriated major was mad; and, in faith, it was very nearly being verified, for Mr Pestle's suggestion put the major into a terrible rage, which actually confirmed the apothecary in his opinion. He therefore threw him down, put a strait waistcoat on him, and left him lying on his back, and then sent him some cooling draughts, and some lotion for the jaw, which was to be applied in due season. The major then found that there was nothing for him but submission. After some time had elapsed, he made signs for pen, ink, and paper; and as these were instruments which it was supposed he could not much injure himself with, they were furnished to him; and when he got them, he wrote on the paper just these words: "For God's sake, send, with all possible speed, to Mr So-and-so, surgeon to the regiment." Well, that was considered a very reasonable request, and therefore they sent off a man on horseback, immediately, for the surgeon. The surgeon came, took off the blister which the sapient apothecary had applied, threw the lotion out of the window, undid the strait waistcoat in which the major was incarcerated, warmed his hands, introduced his two thumbs to the back of each side of the lower jaw, pressed down the condyles, and at the same time elevating the angle of the inferior maxillary bone, the jaw slipped into its socket. So much for the major, the apothecary, and the regimental surgeon.'"

On another occasion, "speaking of the effects of bleeding in removing temporary fits of mental derangement, he related the following case; loud fits of laughter following its narration :—

'A gentleman of fortune residing in Portland Place fell in love with the late Princess Charlotte of Wales; and so earnest was he to obtain her in marriage, that he became insane. His family and friends became alarmed for his personal safety; and fearful lest he should commit suicide, placed him under the care of a physician, who directed, without loss of time, that he should be freely blooded. To this, after repeated attempts, he refused to accede. However, a pupil of one of the physicians hearing of the circumstance, hit upon an expedient, and engaged to bleed the patient. The plan was contrived, and the patient was introduced to the young gentleman, who stated that he was the bearer of a message from the princess, and requested to see Mr —— in private. No sooner was this information received, than the pupil was shown into the drawing-room. The door was cautiously shut, and the patient with great earnestness requested the stranger to divulge, without loss of time, what message he had to communicate from the princess. "Why, you must know, sir," said he, "that we must be particularly cautious. I am deputed by the Princess Charlotte to inform you that she would give you her hand in marriage, but she is prohibited from so doing in consequence of the king her father having been informed that you possess white blood in your veins instead of red." "Good God!" exclaimed the patient, "if that be the case, pray let me be bled instantly, that her royal highness may be convinced to the contrary." And the pupil did bleed him, until he nearly laid him prostrate on the floor; and in a few days the patient had recovered, and his delusion of course left him.'"—*From "Physic and Physicians," a work lately published.*

NUMBER 434. SATURDAY, MAY 23, 1840. PRICE THREE HALFPENCE.

A FEW THOUGHTS ON HISTORY.

HISTORICAL compositions are usually of two kinds. The first kind are the productions of individuals who have been concerned in the events, or who at least have lived during the time when the events were transacting, and for these reasons suppose themselves competent to give a faithful report of what passed. To this department belong such works as Sully's Memoirs, Burnet's History of his Own Time, and Horace Walpole's Memoirs of the Last Ten Years of George II. The second kind are narratives compiled from such original works as the above, with the assistance of other documents, and usually aiming either at an elegant and entertaining picture of the times, or at a philosophical view of human passions and motives, and of political and social maxims, as they chance to be illustrated, or to be supposed to be illustrated, by the series of transactions adopted for a subject. Of this class are the well-known histories of Gibbon, Hume, Robertson, and many others. History may be, in the one case, said to be original; in the other, to be derived.

If any one were proposing to inquire how far history of any kind is entitled to the faith of its readers, he would probably be disposed to pass original memoirs with very light investigation, as supposing that what men saw with their own eyes, or were intimately connected with, could not fail to be faithfully described by them. Here, however, there is reason to fear that he would find himself far wrong. The chances of misrepresentation appear to be nearly as great in original, as in derived history.

Most readers will remember an anecdote of Sir Walter Raleigh, which, nevertheless, we shall repeat from memory. It represents Sir Walter as sitting in his apartment in the Tower, engaged in the compilation of his History of the World, when suddenly a brawl took place under his windows. Presently after, a gentleman entered and gave him an account of the turmoil, which the historian did not think by any means consonant with the truth. Soon after, another gentleman entered, and gave still a different, but, as Sir Walter thought, equally untrue version. Raleigh was confounded, and had nearly laid aside his task in despair, "for," said he, "when two persons so erroneously report a trivial incident which has taken place within the last hour, how should I hope to give a just account of transactions, many of which took place three thousand years ago?"

This anecdote may be true or not; but it would not be difficult to show that it is at least consistent with nature. The Duke of Sully relates one to the same purpose. After the battle of Aumale, Henry IV., being slightly wounded, retired to bed at Neufchâtel, and, calling some of his officers around him, led them to converse familiarly respecting the dangers of that day; "upon which," says Sully, "I observed as something very extraordinary, that, amongst us all who were in the chamber, there were not two who agreed in the recital of the most particular circumstances of the action." Hereupon the translator remarks, that, although there are a great number of writers and even contemporaries, who have treated of the military exploits described by Sully, no two could be found agreeing exactly in their descriptions. The same discrepancy is found in the various accounts which have been given, by parties concerned, of the flight of the royal family of France in June 1791. All of these differ considerably. Even being on different sides of the king's carriage when he stepped into it, seems to have produced irreconcileable differences in the ideas of parties as to what took place. But it is needless to multiply instances. Every one who has ever seen a written account of any thing which he happened to witness or be concerned in, must have remarked that it contained statements, if not absolutely contrary to what he thought true, at least very considerably different from the representations which *he* would have given.

These differences are in some measure a result of the different point of view from which each particular individual beholds any thing that is going on, as philosophers tell us that the rainbow is different to every one beholding it, since the sun's rays are not refracted, in the eyes of any two persons, exactly in the same angle. There may be such differences, and yet the result will in the main be the same—as a rainbow must be upon the whole a rainbow to all who stand near one particular spot. But it may be otherwise. The discrepancies may be in essential points, such as give a totally different turn to the matter in question. And we are as yet supposing the witnesses to be all alike qualified to bear faithful witness. But they may chance to be prejudiced, or corrupted, or interested in giving a particular view of the event, or some of them may be of weak understanding, or at least of little power of observation; and then of course the differences from each other, and the variance of all from truth, must be much greater. The chance of such variances is increased in proportion as the event is removed from a simple incident, and assumes the character of a series of complicated political movements. We have only to consider how different are the accounts given every day by party writers, of events passing before our eyes, in order to be assured of the extreme infirmity of all such evidence.

In the composition of derived history, there is an opportunity of weighing the statements of original history against each other, and rejecting those which appear least credible, or which can by these means be proved to be false. Writing, too, at a cool distance from the events, a philosophical mind is enabled to rise above prejudiced views of the characters of individuals and of actions. But here the advantages stop. For his facts, the writer of derived history is still much at the mercy of the original authors. In his selection, he may, in rejecting the least probable, be choosing only the least true, for the true and probable, it is acknowledged, are not always one. In truth, if a selection is to be conducted on the principle of comparative credibility, we know well that the writer must often go wrong. Then, distant as he is from the events, he has also his prejudices, moral and political. These both affect his selection of facts, and introduce a strain of sentiment which may greatly affect the verity of his picture. The history of Greece, for example, has been written by Mitford and Gillies, both of them honest men, but the one of aristocratic and the other of democratic tendencies. Accordingly, in Mitford's narrative, all the greatness of Greece is ascribed to the occasional preponderance of aristocratic principles; while in that of Dr Gillies, the very opposite conclusions are arrived at.

There is another source of abundant error in derived history. Where, as is generally the case, an effort is made to form a smooth and flowing narrative, in elegant modern phraseology, the events, characters, transactions, and features of the time, all suffer a kind of translation or paraphrase, which greatly alters their character, and in many instances is attended with the effect of both suppressing the true and creating the false. No one who has not compared the elegant and sprightly historical narratives of the last and present age with the simple and homely chronicles from which they have mostly been compiled, could form any adequate idea of the perversion which history is thus made to suffer. Sometimes a bare and rigid fact is amplified, as it were a skeleton clothed with flesh and blood. Sometimes new facts are imagined and added, in order that the only one for which there is authority may tell a little better. There is a great deal of rounding off and polishing down to make all fair, straight, and fluent. Carelessness also has its effect in bringing about alterations. Even in the change from the homely expressions of an early age to those suitable to the times of the writer, the real character of the events is falsified. We shall adduce some examples, to make our meaning plain.

In Sir Walter Scott's Tales of a Grandfather, the following anecdote respecting King Robert Bruce's expedition in Ireland occurs:—"One morning, the English and their Irish auxiliaries were pressing hard upon Bruce, who had given his army orders to continue a hasty retreat; for to have riskod a battle with a much more numerous army, and in the midst of a country which favoured his enemies, would have been extremely imprudent. On a sudden, just as King Robert was about to mount his horse, he heard a woman shrieking in despair. 'What is the matter?' said the king; and he was informed by his attendants that a poor woman, a laundress, or washerwoman, mother of an infant who had just been born, was about to be left behind the army, as being too weak to travel. The mother was shrieking for fear of falling into the hands of the Irish, who were accounted very cruel, and there were no carriages or means of sending the woman and her infant on in safety. They must needs be abandoned if the army retreated.

King Robert was silent for a moment when he heard this story, being divided betwixt the feelings of humanity, occasioned by the poor woman's distress, and the danger to which a halt would expose his army. At last he looked round on his officers, with eyes which kindled like fire. 'Ah, gentlemen,' he said, 'let it never be said that a man who was born of a woman, and nursed by a woman's tenderness, should leave a mother and an infant to the mercy of barbarians! In the name of God, let the odds and the risk be what they will, I will fight Edmund Butler, rather than leave these poor creatures behind me. Let the army, therefore, draw up in line of battle, instead of retreating.'

The story had a singular conclusion; for the English general, seeing that Robert the Bruce halted and offered him battle, and knowing that the Scottish king was one of the best generals then living, conceived that he must have received some large supply of forces, and was afraid to attack him. And thus Bruce had an opportunity to send off the poor woman and her child, and then to retreat at his leisure, without suffering any inconvenience from the halt."

So writes Sir Walter Scott. Barbour, in his heroic poem of "the Bruce," relates the story differently. Divested of the metrical form and of antiquated spelling, his account is as follows:—"There [Limerick] they lay two or three days, and then prepared again to fare [march]. And when they were all ready, the king heard a woman cry. He asked in haste what that was. 'It is the lavender, sir,' said one, 'who has just now taken her child-ill, and must be left behind us. Therefore it is she makes yon evil cheer.' The king said, 'Certes it were a pity that she should be left in that point, for I trow there is no man would not rue [have compassion on] a woman then.' He there arrested all his host, and garred a tent be soon stented; and garred her gang in hastily, and bade other women to be by her, while she was delivered; and then rode forth on his way. And before he went forth, he ordered how she should be carried [afterwards]. This

Digitized by Google

was a full great courtesy, that such a king, and so mighty, garred his men dwell in this manner, but for a poor lavender. Again northward they took their way, through all Ireland," &c.

Will it readily be believed that for the first of these stories there is not a vestige of ground in ancient narrative or chronicle, besides the circumstances narrated by Barbour? The danger incurred by stopping, the fear of the woman that if left behind she would fall into the hands of the cruel Irish, the fine look of the king and the fire which flashed from his eyes, his appeal to his officers, his resolution to risk a battle, and the happy result which after all attended his delay, are all imaginary—not to speak of the liberty which has been taken in representing the infant as already born. The old historian only expresses his surprise, natural to a man in that age, that a great king should have put himself to a little trouble on account of a poor serving-woman; but the modern historian, unable to content himself with this simple, natural, and pleasing case, must imagine new circumstances to make it tell on his own sentimental age. We do not quarrel with Sir Walter for his way of narrating the story; we acknowledge, on the contrary, that he has made it very interesting; but it is fiction, and not history, or at least what history is usually understood to be.

An elaborate inquiry instituted a few years ago by Mr George Brodie into Hume's History, brought to light a number of remarkable departures from truth in that work, partly perhaps the result of prejudice, partly of carelessness, and partly of a desire for effect, the peculiar sin of modern writers of almost all kinds. We shall not occupy the attention of our readers with many instances. Respecting the conclusion of the life of Charles I., the historian says, "Every night from his sentence till his death, the king slept sound as usual, though the noise of the workmen employed in framing the scaffold, and other preparations for the execution, *continually resounded in his ears*." Now, the scaffold was erected at Whitehall, and it would have been necessary for the king to be lodged in that palace in order to hear these preparations making. The fact, however, is, that he lodged at St James's Palace, and did not come to Whitehall till the morning of the day of his execution. The truth is stated explicitly by Herbert, the king's attendant, in his Memoirs; which, of course, are a good authority. But Mr Hume chose to overlook this, and adopt the striking circumstance of the noise in the king's ears from Clement Walker, a much inferior authority, who certainly states it, but in the very next page contradicts it, by saying that the king walked from St James's to Whitehall *that morning*. Mr Brodie examined the copy of Herbert in the Advocates' Library, and recognised Mr Hume's pencil mark at this very passage; so that he must have been perfectly aware how the fact stood.

Mr Hume represents Charles II., while concealed in the oak at Boscobel, as seeing several soldiers pass by, all of them intent in search of him, and many of whom "expressed in his hearing their earnest wishes of seizing him." Accordingly, the sign of the Royal Oak invariably exhibits several soldiers riding about close under the tree. The historian also represents Charles as sitting in the oak for twenty-four hours. If we are to believe the king's own narrative, he was concealed in the tree only from the early part of a day till the evening; had a companion and provisions, which Hume does not advert to; and only saw soldiers at a considerable distance searching the wood for persons escaped from the battle, and probably with no particular idea of the king in their heads. This part of Mr Hume's narrative betrays marks of great negligence, at the same time that a love of the marvellous has induced him to add some circumstances which had no existence in reality. Many of the other striking points in history, which, either from reading them or from seeing them frequently depicted by artists, we have had strongly impressed on our minds, are grounded probably on no better foundation. The parting of Louis XVI. from his family is a historical tableau, more deeply impressed perhaps on the public mind than any other event of modern history. Strange to say, no such parting took place. The Duchess D'Angouleme herself states, that, her mother having, the night before the execution, asked to be allowed to see the king again, with the children, next morning, he consented, but afterwards requested that they might not be permitted to return, as their presence afflicted him too much. This scene, therefore, which, as the Edinburgh Review remarks, "has been handled both in prose and verse, and represented in all sizes of pictures," turns out to be a fiction.

No points in history are more impressive than *mots*, or remarkable expressions, which have dropped from the mouths of great personages on particular occasions. But we fear that very few of these would look so well as they now do, if particular inquiry were made respecting them. Philip of Valois, flying from the battle of Cressy, and arriving before the closed gates of the castle of Braye, exclaims (in history), "Ouvrez, ouvrez, c'est la fortune de la France!" [Open, open, to the fortunes of France.] This sounds well, for the dullest understanding is alive to the feeling under which the king appears to have embodied in his single person the depressed fortunes of his country. But when we turn to the first copies of Froissart, the original narrator of the incident, what do we find? Only the tame but natural exclamation of the king, "Ouvrez, ouvrez; c'est l'infortuné roi de la France." [Open, open; 'tis the unfortunate king of France.] According to all histories, Francis I. wrote to his mother from the field of Pavia, "All is lost but honour." It happens that the letter which the king really wrote on that occasion is preserved; and in it, after an account of the battle, he is found to say, "With regard to the remaining details of my misfortune, honour and life, which is safe, are all that are left to me. To know this will be some consolation in your adversity, and therefore I have begged permission [from his captor the emperor Charles] to write to you this letter," &c. It thus appears, that, instead of the pithy dispatch said to have been sent off from the battle-field, the French monarch wrote, in prison and by permission, a pretty long letter, in which the idea certainly occurs, but so accompanied, that its effect, as the quick outburst of a regal spirit in sudden adversity, is totally lost.

To take another example from French history—Henry IV., usually called The Great, is said to have written the following pithy sentence to one of his bravest nobles, after the battle of Arques:—"Hang thyself, brave Crillon; we have fought, and thou wert not there!" Now, various letters from Henry to Crillon are extant, and the expression "hang yourself" does occur in one of them; but that one was written long before the battle of Arques. Henry wrote it when carrying on the siege of Amiens. "Brave Crillon," says he, "hang yourself for not having been with me on Monday last, on one of the finest occasions which ever was seen, or probably ever will be seen. The enemy sallied out very furiously, and retreated very shamefully," &c. The letter goes on in the same style for some length. The force of the *mot* is thus sadly diminished when one reads the original, but still more is its point curtailed, when we learn that Henry was in the habit of saying "Hang yourself" to every body. It was an expression continually in his mouth, and appears in numbers of his letters to Biron, Haramburc, and others of his intimates.

These, we think, are curious proofs of the misrepresentation to which events and circumstances are liable when they are reported either by persons concerned, or by those who write afterwards from original authorities. They might easily be multiplied: and we might further advert to the doubts which a little inquiry threw on the popular history of Richard III.; the cutting of eight centuries and some fifty kings from Scottish history by Innes and Pinkerton; and the more recent labours of Niebuhr, by which the early monarchy of Rome, with the laws of Romulus, and a great many other things, have been transferred from the region of the historical to that of the mythic or fabulous. It is evident that there is great reason to doubt all history which has not been rigidly inquired into; but even after all practicable inquiry has been made, there must remain great room for doubt, for it does not seem to be in human nature to give a strictly just and true account of the most familiar circumstances. It is, indeed, probable that *not one fact is the whole range of history, original and derived, is truly stated.*

Are we, from this, to argue that history is altogether useless? No, certainly. But it seems proper that the prevailing opinions respecting its utility should receive a little correction. The veneration which describes it as philosophy teaching by examples, would need to be somewhat cooled. Philosophical history has been thus described by an able hand:—"The other plan is far more comprehensive and ambitious—professing not only to make a selection of the facts most worthy to be recorded, by abridging some and dwelling at length on others, but also to pass an authoritative judgment on the wisdom or folly, the merit or demerit, of all the acts and actors with which it is conversant—to trace memorable events back to their causes, and forward to their consequences—to furnish, in short, not only a true account of the facts as they occurred, but a satisfactory theory of their connection and mutual dependency, and thus to teach far more of their true character and value than was probably known to those who produced them," &c. To think of all this being done, when, so far from a correct appreciation of motives being attainable, the simplest matters of fact cannot be found stated by any two persons in the same way! We fear the views of learned persons on this point have been a good deal overstrained; and, indeed, the world at large may be said to affirm our remark, for the dictates of this philosophical monitor are practically disregarded, or, if ever referred to, seem to different minds to sanction opposite kinds of conduct. We question if a single tolerably authentic instance could be pointed out, of one series of transactions, as recorded in history, proving the means of actuating the leading men in any other series, to the advantage of the community; while instances of their acting in apparent contradiction to the lessons, as they are called, of history, occur every day. If we were to regard history as an effort merely to satisfy curiosity respecting what has gone before, or to contribute towards that enlargement of the mind which information produces, we should be coming nearer the real measure of its utility. Beyond this, it seems to us only to entertain, which was its first object—as is expressed by old Barbour:

> "Stories to read are delectable,
> Suppose that they be nought but fable"—

for which end it matters little whether the writer should take the better half of his facts from his own fancy, or "tell the tale as 'twas told to him."

RUSSEL'S AUSTRALIAN TOUR.

Mr Russel, a young man engaged in mercantile pursuits, having in the course of last year visited the principal ports in the Australian colonies, has on his return published a small and unpretending volume descriptive of what he actually saw and learned at the different places during his stay.* So many books of questionable veracity have been lately written respecting these colonies in connection with emigration, that we should certainly have avoided noticing Mr Russel's production, if we had not some assurance, from a personal knowledge of the author, that his statements may be relied upon as correct, and are therefore of that nature which it may be advantageous to make widely known.

The first place to which the writer proceeded was Adelaide in South Australia, and his account of that town and its neighbourhood, as will be seen from the extracts which we shall present, is in every respect corroborative of the statements which we were lately enabled to lay before our readers on the subject.

The vessel having arrived in Holdfast Bay, on the 31st of March 1839, a party of emigrants put off for shore, with the captain, making for a landing-place pointed out to them at Glenelg, by some morning visitors. "On getting near the shore, we had smoother water, till our boat grounded, and our sailors carried us over the surf to the beach on their backs: the first ground we now touched, after being a hundred and thirty days at sea. Here were some people employed in carrying sheep on shore through the surge, from the long-boat of a vessel just arrived from Van Dieman's Land. They had much difficulty in keeping these sheep from drinking of the salt water; this, by carelessness, often proves fatal to them; the beach was strewed with many carcases. On crossing a ridge of sand-hills, we came to a small house, beside a few sheep or cattle folds, for the accommodation of those landed here. After getting proper directions, we started for Adelaide, passing along an extensive plain, finely interspersed with trees, and presenting altogether a beautiful scene, but for the very sandy and parched look of the soil, with the grass so very thinly set on these sandy flats. Along this path lay many carcases of sheep, on which the carrion crow, with his peculiar glossy skin, and incessant croak, was feasting. The day was very hot, and our long want of exercise in walking rendered it rather more oppressive than we could have expected. At half way there is, as is common in older countries, a house for the accommodation of travellers, as the sign-boards are wont to read. Paid here 3s. for each bottle of porter. This we did not grudge, considering that we had seen none for some time. There was a very neat brick house getting up for better accommodation than the present one, which is quite a primitive looking affair.

As the different novelties presented themselves at every step, our party began to separate, each according to his own fancy, some taking great pains to ascertain the nature of the soil, others to gather the exotics, whilst others, more sanguinary, waged war with all and sundry of the feathered tribe, every shot sending its echo rumbling again on the ear of those hastening forwards to the city of Adelaide. In our progress we met a very communicative and pleasant person, who put us in possession of as much information regarding the settlement, as it is called, and its inhabitants, up to the present time, as could have been gleaned from a whole file of newspapers. Such sort of persons are truly invaluable. We also met accidentally with the emigration agent, who gave us what official information was necessary for land-order holders, and their work-people, how to proceed, and shortly reached Emigration Square, a number of wooden houses, put up for the reception of the commissioners' emigrants, where they remain till employment is given them; if by the commissioners, it is at a lower rate of wages than is given by private individuals. At this time, from the number of recent arrivals, it was full; and in conversation with one of them, we learned that great discontent was exhibited amongst them, arising from (as he said) the inducement held out to them before leaving Britain, of comforts awaiting their arrival, which had not been realised; besides, sickness, then existing among them, unfortunately tended to increase the disappointment; diarrhœa and ophthalmia frequently affect the newly-arrived colonist, the former caused by a free use of the water, and the latter from the reflection of the sand."

Speaking of Adelaide and its inhabitants, Mr Russel observes, "There are some very good inns in the town of Adelaide, having their sleeping-rooms generally apart from the public ones altogether; which is an excellent arrangement. There is one inn here deservedly well supported by visitors, from the style of conducting it, *a la Parisienne*, the lady gracing the head of the table; its looking-glasses and lamps, &c., giving it much the

appearance of the *cafés* in Paris. A great deal of information is to be gathered here on an evening from those who frequent it, of what is going on in sales, purchases, surveys, &c. There are also some extensive shops and stores, which, from the influx of strangers, present a business-like stir. Several individual instances of prosperity have already shown themselves, by attending to the advice of making hay while the sun shines. I wish I could add truly, *growing hay*, or any thing else, for the comfort of many others."

The most extraordinary circumstances connected with the town are, that it is situated about five miles from the sea-shore, and that this sea-shore is unapproachable by vessels, so that the landing of both goods and passengers is attended with the greatest difficulty and expense. It would seem as if the very worst spot on the whole line of coast had been selected for the capital of the infant colony. Speaking of the creek in which the landing is performed, Mr Russel observes, "The banks of this creek up from the anchorage to the port, a distance of about five miles, extend with muddy surface near to mid-channel in some places, making it rather difficult to navigate a ship's boat, although pilots take up craft drawing much more water. On these banks are great numbers of teal, wild-ducks, &c., all affording excellent opportunities for the sportsman, but for the difficulty of obtaining them after being killed. We grounded on a sandy shoal which lies near to the wharf, and got carried out as before to the bank, which runs down to this shoal, getting dry at low water. Here goods of every description lay waiting conveyance up to town, furniture, provisions, agricultural implements, carts, carriages, boxes and barrels, all in a heap, the owners having brought out these necessaries on the faith of having plenty of good surveyed land ready to choose from, and there convey such stock and stores at once; but how different is the case at present!"

Land-jobbing, as B—— and others have mentioned, is the grand object of attention:—"The system of land-jobbing is carried on here to a great extent by companies and capitalists, keeping up a constant excitement in town, which would otherwise be dull indeed. It is, in fact, the *ne plus ultra* of Adelaide conversation. Parties are to be met at their different rendezvous, talking of nothing else but their favourite *spec*. In the public room, one evening, were a few ready to dispose of sections at Port Lincoln, with a frontage for building, &c., in the proposed town, at the moderate rate of twelve hundred per cent. profit.

A party of these puffing worthies being met together, along with a few uninitiated members of the Adelaide community, one of the former in a speech was holding out the unparalleled rise in price of this splendid portion of Australian land, at the same time making offer to buy up any order at the great price, so certain was he of a still greater—(this was intended for the newspapers alone). But a person not exactly in this way of thinking was present; he immediately caught at the offer; sell out he would; buy they must, to keep up the price of shares; when, alas! on the return of some explorers, two days afterwards, disappointed in their hopes, the price of sections fell at once to below par, and defeated the Port Lincoln Hotellers.

Among the whole population now in this province (computed to be about 8000 souls), there is not yet a single farm that deserves the name. And in the only branch likely to remunerate the colonist here, namely, that of grazing, up to the present time there are just about forty-five sheep and cattle stations, a great part of these being the property of the South Australian Company, and others who have obtained special surveys, to the exclusion of single individuals of limited capital."

What, then, supports the population? Hear Mr Russel on this trying question. "One has but to look on the many houses, and the people who occupy them, generally, when the question starts itself, what supports this community? or, look at the mode of colonisation pursued at present here, and the question comes more strongly, from whence are all the people so *suddenly* brought together able to find returns? Really so many nice little books have been got up respecting this colony, and so few have taken notice of their fallacy, that many continue to consider them as the sentiments of the colonists; indeed I have heard some confess that they emigrated on the faith of these very publications, wherein the writers have condescended, with such apparent sincerity, to quote prices current of the neighbouring colonies as being theirs, giving the sailing distances from other settlements (this suits a purpose), the immense increase of population, &c., and then launched out in praise of its superiority to all other places, in the growth of maize, potatoes, cabbages, onions, peas, &c.; even the very natives are a superior class of beings to all others in New Holland.

With regard to crops, there is little doubt but some land will be found, as in other colonies, fit for agriculture. Up to this period, however, nothing but a few patches of ground have been turned over, by way of experiment; some maize was sown last season about the reed-beds, which did very well—some gardens in North Adelaide have produced wheat, barley, and oats; besides which, samples of the lucerne and Italian ryegrass have been grown. About two acres of land near South Adelaide were planted by the owner with potatoes; these presented such a fine and novel appearance, that a merchant offered L.400 for them, which was refused; but drought came, and hurt the expected growth exceedingly, leaving the grower minus of the *offer*. This is one of the greatest and most common drawbacks the farmer encounters on this vast continent, thus rendering the occupation of an agriculturist rather precarious."

The prices of articles quoted by Mr Russel are on the same exorbitant scale mentioned by B——, and need not be extracted.

Mr R. afterwards visited Port Philip, his opinion of which seems to be more favourable than of Adelaide or its neighbourhood. Meanwhile, we close our extracts with the single observation, that of all the colonies belonging to Great Britain, and claiming the notice of the emigrant, South Australia appears to be decidedly the worst. The principle on which it was founded is excellent, but the country, from all trustworthy accounts, is execrable, and unfit for receiving a large population, and against that natural misfortune no species of economic arrangement can make head. We do not by any means offer this opinion from a wish to disparage a well-designed scheme of colonisation, or to lead attention to other places as more favourable settlements. At the present moment we strongly recommend all classes of intending emigrants to wait for a short time before deciding on which shall be the land of their adoption. Nearly all our colonial possessions are at present *out of sorts*, and it would be difficult to say which promises to settlers the largest share of social discomfort.

SEALS AND SEAL-HUNTING.

THE general characters of the seal, as an animal of considerable size haunting unfrequented coasts, and living much in the water, although warm-blooded and breathing the atmosphere, must be well known. There are many varieties of it—perhaps more than twenty—but it is not necessary to trace these minutely in this place. Two kinds only are found, except very rarely, on the British coasts; one being what is called the Common Seal (*Phoca vitulina* of naturalists), which is generally six feet long, and the other the Great or Bearded Seal (*Phoca barbata*), which is about two, and sometimes so much as three, feet longer. The seal, in all its varieties, has one common property of a long body sloping to the hinder extremity, with two short paws or paddles in front, and two hinder and larger paws projecting straight out behind, by which appendages it swims swiftly in the water, and can even manage to walk or crawl upon land. The head is roundish, like that of some of the feline tribes, but with a countenance of mild expression, and the remarkable peculiarity of possessing no external ears; the skin over the whole body is tough, and covered all over with short bristly hair. The animal is carnivorous, and has accordingly a pair of long pointed teeth in each jaw. The tribe are ranked by naturalists as the third tribe of the *Carnivora*, which again form the third family of the order *Carnassiers* (butcher-animals) of Cuvier. Living on fish, they may be said to serve an end at sea, analogous to that which the rapacious quadrupeds and birds serve by land, namely, to keep down the abundance of the smaller animals.

Seals can remain about ten minutes or a quarter of an hour under water, while engaged in pursuit of prey; but it is necessary that they should after such intervals come to the open air, as otherwise they would be drowned. In some instances they have been known to remain about twenty-five minutes under water, without any fatal effect; but the animals which did so must have been unusually calculated for the purpose by nature or habit, like pearl-divers amongst the human race. When a seal catches a fish, it holds it in its fore paws, and with its teeth tears off the skin, after which it makes its meal. Towards other animals, the demeanour of the seal is timid and gentle. It never seeks an encounter with man, but will use every endeavour to avoid him, and only act on the offensive if it cannot otherwise make its escape. The two sexes pair, and the female brings forth one each summer, generally in some sheltered situation, as, for instance, the beach at the inner extremity of a cave which the sea enters. The young one is no sooner born than it will take to the water, and display all the activity of its seniors. The seal is gregarious, and groups of one, two, and three dozen, and sometimes many more, live and disport themselves together. They often spend many hours lying on rocks a little way out to sea, all being ranged in a close row, with their heads to the ocean, ready to tumble in on the least alarm, while one stands a little apart, like a sentinel, with head erect, and the senses in activity, to watch the approach of danger.

The brain of the seal is a well-developed organ, and the animal possesses so much intelligence and sagacity that it has been called the Dog of the Sea. It seems quite ascertained that they have a relish for music, and many successful efforts have been made to tame them. A young one, taken into human society, instead of exhibiting symptoms of terror, will court attention, and suck a finger held out to it, like many domestic animals. It is related of a seal domesticated in Orkney, that he would lie near the fire among the dogs, would bathe daily and return to the house, but, having found his way to the byre, he used to steal there unobserved and suck the cows; on which account he was discharged, and sent back to his native element. Another, of the bearded or great kind, which was taken from a cave in Shetland, when only a few hours old, became in a day or two as much attached to its captor as a dog. "The varied movements and sounds," says this gentleman, "by which he expressed delight at my presence and regret at my absence were most affecting; these sounds were as like as possible to the inarticulate tones of the human voice."* The same gentleman captured a female six weeks old, also of the great or bearded kind. "This individual would never allow herself to be handled but by the person who had the charge of her; yet even she soon became comparatively familiar. It was amusing to see how readily she ascended the stairs, which she often did, intent, as it seemed, on examining every room in the house; on showing towards her signs of displeasure or correction, she descended more rapidly and safely than her awkwardness seemed to promise. She was fed from the first on fresh fish alone, and grew and fattened considerably. We had her carried down daily in a handbarrow to the sea-side, where an old excavation admitting the salt water was abundantly roomy and deep for her recreation and our observation. After sporting and diving for some time, she would come ashore, and seemed perfectly to understand the use of the barrow. Often she tried to waddle from the house to the water, or from the latter to her apartment, but finding this fatiguing, and seeing preparations by her chairmen, she would of her own accord mount her palanquin, and thus be carried as composedly as any Indian princess. By degrees we ventured to let her go fairly into the sea, and she regularly returned after a short interval; but one day, during a thick fall of snow, she was imprudently let off as usual, and, being decoyed some distance out of sight of the shore by some wild ones which happened to be in the bay at the time, she either could not find her way back, or voluntarily decamped. She was, we understood, killed very shortly after in a neighbouring inlet. We had kept her about six months, and every moment she was becoming more familiar; we had dubbed her Finna, and she seemed to know her name." Mr Frederick Cuvier, in a work published in 1824, says, "I have lately had occasion to witness a seal which displayed much intellectual power. He did punctually what he was ordered. If desired to raise himself on his hind legs, and to take a staff in his hands, and act the sentinel, he did so: he likewise, at his keeper's bidding, would lie down on his *right* side, or on his *left*, and would tumble head over heels. He would give you either of his paws when desired, and would extend his sweet lips to favour you with a kiss."

The skin of the seal is convertible to useful purposes, and underneath it he has a layer of blubber, from which a considerable quantity of oil can be obtained. Without regard, then, to his flesh, which used to be eaten in some northern countries, he is an object of some importance to man. Seal-hunting was once practised to a great extent in Norway. It is now followed as a regular branch of trade by vessels which proceed for the purpose from America, both to the Arctic regions and to the South Sea Islands, but particularly the latter. From Great Britain, also, a few vessels sail annually to Greenland for the same purpose. A particular kind of seal in the South Sea is more than usually valuable, on account of the goodly coat of *fur* with which he is covered.

In Shetland seal-hunting is followed partly as an amusement, and partly with a view to profit; and the various modes in which it is carried on, give occasion for the exercise of much ingenuity, and for much lively adventure. We find some interesting particulars on the subject in the paper by Dr Edmondston, already quoted, that gentleman being himself a great seal-hunter. One mode of the sport was to beset the caves in which the pairs live at the time of the birth of their offspring.

"The caves to which the Great Seal resorted, are arched perforations in the precipices open to the sea, and extending inwards sometimes upwards of a hundred fathoms, terminating in pebbly beaches, on which the young were born and nursed. Some of these caves can only be entered under water, like the one in the Friendly Islands described by Mariner, and immortalised by Byron; and others are too winding and narrow to admit of access. When the entrance was sufficiently capacious, the sea smooth, and the seals were known to have brought forth, two boats proceeded to the cave; the one lay at the mouth; the other, attached to its second by a line sufficiently long to reach to the extremity of the tunnel, pushed inwards. On reaching the beach, some of the crew leaped out and knocked on the head as many of the old ones as they could, the rest escaping to the sea, without attempting to defend their young ones, who were then dispatched at leisure. On such occasions, from ten to twenty young ones were sometimes taken from one cave; the booty belonged to the owners of the property in which the caves were situated, and a portion of it was assigned as a reward to the captors. These caves, or *Hellyers* as they are here termed, were at one time held in strict property, and highly valued; and formal deeds of conveyance of them, as well as of fowlings, were occasionally made, one of which I have seen.

Seals were also at all seasons sought for and surprised on the rocks. A curious anecdote was related to me in Faroe of a native assailing, on the rocks, a male of the Great Seal, but not being able to detain

* Observations on the Distinctions, History, and Hunting of Seals in the Shetland Islands. By Lawrence Edmondston, M.D. Memoirs of the Wernerian Natural History Society, vol. viii. part I. 1839.

Digitized by Google

him, actually got astride on his back, endeavouring to behead him at the gallop, and slipped out of the stirrups hardly in time to allow his *Barb*, mortally wounded, to take his leap, all alone, into the water. Lucas Debes, the old historian of those remote isles, and Donald Maclean, in his account of one of the Hebrides, make mention of the practice of hunting seals with dogs; the services of which, however, could amount only to irritating them to resistance, and thus, by detaining them a little, to gain time to the hunter to attack them with the club, for the strength of any dog is utterly trifling compared with that of a seal of ordinary size.

Within even the last twenty years, both species of seals have become much more rare and cautious, so that the net and the gun remain almost the only means of capture. In a few districts the net is employed for taking the Common Seal, by being set near the rocks frequented by them, while they are absent, and lying in wait till they again approach the shore, but it is chiefly used for catching the Great Seal. The dimensions of the net are about fifteen fathoms long and five broad, the meshes are nine inches square, and it is made of strong cod-line. When the seals are suspected to have brought forth in a cave, the net is rapidly and silently dropped across the entrance. A man holding a rope attached to its upper ends is placed on each side, on some convenient pinnacle of rock that affords footing. Sometimes, from the shelving of the sides of the cave, the net cannot easily close it, and in this case the men hold each a long pole, with a bunch of straw or other substance at the end, keeping it constantly in motion under water, to deter the animal from escaping by means of this vulnerable part of the line of siege. When all is secured, the boat proceeds inwards as far as possible, and by firing and hallooing the men endeavour to induce the seals that may be in the cave to venture out. "This they soon attempt, and are consequently caught in the net. When fairly enveloped in the net, or *masked*, as it is called, the capture is considered secure. The power of the animal is constrained, and even were it not, he has to lift a mass of wet net, with heavy weights attached, to the surface, every time he attempts to respire: only the largest and most powerful can accomplish this; but when he does, or when the water is so shallow as to render it easy, he is shot. Generally he cannot rise, and all that remains to be done is to wait patiently for his death by drowning. From the boat he may be seen making vain efforts to tear the net with his teeth, rolling on the bottom, now and then desperately struggling to disengage himself, and constantly looking up with a most striking expression of defiance and upbraiding at the boat, which he knows contains the agents of his sufferings." He dies in about a quarter of an hour.

This mode of hunting seals is characterised by Dr Edmondston as barbarous and exterminating, and he professes greatly to prefer trusting to ingenuity in approaching the seals, and skill in marking them down with the gun. But he shows it to be no easy sport. The animal is uncommonly tenacious of life. Unless hit in a decidedly mortal part, it will be apt to baffle the huntsman. It is quite impossible to hit it when looking it straight in the face, for it has a trick of shying aside at the moment of firing, which never fails to protect it from harm. "One might think," he says, "that so bulky an animal could hardly contrive, at perhaps twenty or thirty yards, to get so rapidly all his body out of the course of the ball: perhaps guns that shoot wide of the mark would have the best chance of defeating the intention of this manœuvre."

If the seal have sunk, "and if the water be deep, and the bottom covered with sea-weed, we have a new class of difficulties by no means superficial to contend with, and a new source of excitement commences. Two important auxiliaries, the water-glass and the klam, are now put in requisition. The former is simply a large tub with a pane of glass fitted water-tight in its bottom; the tub is immersed an inch or so in the water, and by means of this instrument we can see tolerably clearly from six to sixteen fathoms down, seldom more; for clear water is with us still more rare than a clear atmosphere. Many a time have I wished for those limpid waters of the North Cape, where, as travellers tell us, halibut and herring may be seen twenty fathoms deep playing at hide-and-seek amongst the submarine jungles. The use of the water-glass seems to arise from its power of preventing the rays of light proceeding through it from the bottom from being affected by any agitation on the surface. After often a long and fatiguing search, the object is discovered, and the klam is had recourse to. This is a gigantic kind of forceps of peculiar construction, attached to two lines, one of which is to suspend it, the other to guide the blades; it is directed to its object by means of its helpmate the water-glass; the jaws close on the seal, and he is quickly hauled to the surface.

But all this will not ensure success in the seal-hunt. It is not enough to be a good shot, to be well armed and supplied with every equipment; the sportsman must also be intimately acquainted with the habits of the animal, and possess great experience and address to avail himself of this knowledge. Many curious devices are put in practice to allure him within shot, and much patience and sagacity to steal upon him unperceived. Often we range along many miles of coast without meeting with a single seal; but our wanderings are through scenery the most majestic. Who that has ever looked upon them can forget these 'naked' and primitive isles of the Northern Atlantic—their melancholy moors and lonely valleys—their stupendous precipices and foaming surges, lowering clouds and rushing malströms, where the ancient lullaby of the infant Viking was the hurricane, and his play-ground the ocean. In these wild and sequestered solitudes, unbroken by the tumults of faction and the inroads of civilisation, is to be found that untrammelled freedom about which philosophers reason, and poets sing; and it is well to refresh ourselves, in this agitated period of the march of matter, with those pure and ennobling sentiments which the presence of Nature in her sublimer aspects is calculated to inspire. If the fox-hunter has counties to scour, we have islands; if we want his woodlands and rivers, we have our rocks and ocean; instead of chargers, we have boats the finest in the world, combining symmetry, safety, and celerity. Our dogs are far superior in definite attachment and versatile intelligence to the machines of the pack; if we do not enjoy the pleasure of breaking our necks in leaping hedges, we can yet prove our mortality by capering over precipices, breasting billows, and ploughing breakers; no spring-guns, fierce keepers, or game laws, restrict the freedom of our coursing; whatever we behold, either on the land or the water, we can approach. I have repeatedly had for half an hour, under aim of an unerring gun, a seal lying within forty yards of me, and could not find it in my heart to fire; yet I had enjoyed all the enthusiasm of the hunt up to the moment of slaying, and this unalloyed pleasure in addition, of quietly observing the drowsy Triton reposing on his ocean rock, like an ancient Sea-King in his stronghold of plunder, when, withdrawing the finger from the trigger, I started him from his slumbers by a warning shout that sent him plunging into his native element, with a strong consciousness of his danger, and I hope a grateful sense of my forbearance. Taking it altogether, it is a soul-stirring hunt; the game is a noble one; his size, power, activity, sagacity, and vigilance, the slippery element in which he is pursued, presenting enough of dangers to face, and difficulties to overcome. The ingenious stratagems and judicious arrangements to ensure his capture, the rugged grandeur of the scenery of his favourite retreats, present a combination that includes every thing essential that charms us in the chase."

LYRICS OF CAPTAIN CHARLES MORRIS.*

THESE volumes must come upon the general public, as they have come upon us, with the startling effect of a voice from the grave. The name of Captain Charles Morris is associated with the early history of George IV., and with many popular songs, but for forty years he has not in any way given the world reason to believe that he was a living man. We had long concluded respecting him, that he was a dead bard, when in the summer before last he surprised us by appearing in the obituaries of the newspapers, with the age of ninety-three attached to his name. The present publication, in which his best pieces appear for the first time in a collected form, may be said to be a consequence of his recent demise.

Charles Morris was born in a district called the Debateable Land, near Longtown, on the 18th of May 1746. His father was an officer in the army,

> "whose naked sword,
> Earn'd the poor pittance of his daily board."

The son also entered the army, and in the course of time rose to a captaincy in the Life-Guards. Of his first introduction to the Prince of Wales, we have no account before us; but it is well known that Captain Morris became a great favourite at Carlton House, and continued so for many years. As he advanced in life, having, as he says, "left the field for the haunts of the Muse," he appears to have fallen into pecuniary distress, from which he was relieved partly by the bounty of the Prince Regent, and partly by the generosity of another old friend, the Duke of Norfolk. The latter was moved to this act of kindness by an appeal from John Kemble, performed in impromptu blank verse after dinner. In a charming retreat, on the Norfolk estates in Surrey, Captain Morris passed the greater part of his green and vigorous old age, scarcely touched by any of the usual grievances of decaying mortality. Many years ago, Curran had said to him, "Die when you will, Charles, you will die *young*;" and the acute Irishman was a true prophet.

We confess that we have been much pleased, or rather pleasantly disappointed, by a great part of the contents of the volumes now given to the public by the friends of this veteran of the lyre. From an indistinct recollection of one or two of the songs of Captain Morris, it was our impression that his effusions were too deeply tinged with Bacchanalianism to be readable. But although many of the songs do bestow a most objectionable degree of praise on conviviality, there is little grossness in the manner of doing it; and so many reflections, full of an amiable and kindly wisdom, are mixed up with the most of the pieces, that you can at once discern them to have their origin in a vein of cheerful sociality, and not to spring from a spirit of exulting intemperance. Gentle, indeed, is the Bacchanal who thus chants:—

> For me, I shun what stirs the breast
> Of proud and busy man,
> Those fruits that leave the soul unblest,
> And mock life's little span.
> I cull not in those joyless fields
> A crop of weeds and woe,
> But pick the flowers that nature yields,
> And seek them where they grow.
>
> No wealth to me is worth a sigh,
> But pure responsive love,
> And man can neither bribe nor buy
> That blessing from above:
> From nature's heavenly hand it flows,
> Not dealt by earthly will—
> The balmy plant for human woes,
> Unforced by human skill.
>
> I ask but sprightly hope at morn,
> To wake at night my glee;
> A life of health, through honour borne,
> With love and liberty.
> While fate these precious gifts supplies,
> Which heaven ne'er meant to part,
> High shall my mantling goblet rise,
> And grateful beat my heart.

There is more of the spirit of Horace in our author than in any poet perhaps in the English language; and this is a bold saying, though spoken advisedly. He resembles the Roman both in his qualities of heart and intellect; and, indeed, he admits again and again that he ever took the Latin lyrist as his preceptor and guide.

> In childhood I prattled about him,
> In youth he was ever my charm,
> In manhood I ne'er stirred without him,
> In age he lies under my arm.

There is much, for example, of the style of thinking and writing of the old Latin bard in the following lines, entitled

EXPERIENCE.

> Oh! argue not with me, my friend,
> On my gay course of living;
> I take whate'er the gods will send,
> And send them my thanksgiving.
> I try to relish well the grace
> Their mercies offer to me;
> And ready meet, in every case,
> All favours that they do me.
>
> My tongue derides no moral thought,
> No ribald themes now stir it;
> For vice, I know, has never brought
> True joy to mortal spirit.
> Within, a guard of honour lies,
> That ever now instructs me:
> To him I turn my doubting eyes,
> And safely he conducts me.
>
> I've seen, when view'd the course of guilt,
> How end those who begin it,
> Well know o'er shame's abyss it's built,
> For fools to tumble in it.
> I've seen how vainly, night and morn,
> Experience shows her lesson;
> How rashly vice, in wisdom's scorn,
> Still seeks from sin a blessing.
>
> * * * * *
>
> Then think not that a man who hath
> This proof to guide his rambles,
> Will deviate from life's fairest path,
> And stray 'mid thorns and brambles.
> Think not a heart past youth will yield
> The truths experience taught it;
> Or throw aside a holy shield,
> That age hath kindly brought it.
>
> No!—trust me, 'midst my cheerful day,
> A sacred spirit guides me;
> A holy limit bounds my way,
> And duty still decides me.
> This prunes my frolic Muse's wing,
> Corrects my fancy's power;
> Still cheers my bosom, as I sing,
> And charms my jovial hour.
>
> Then cease, my friend, your pious zeal;
> You say you're grave and pensive;
> To hearts thus form'd the sad to feel,
> We know the gay's offensive.
> But were't not better, in this case,
> You joy from me should borrow,
> Than I should shift my happy days,
> To mope, with you, in sorrow.

If we have found comparatively little offence, particularly as regards the spirit and intention, in the festive lays of Charles Morris, justice requires that we should say the same of the songs that relate to other subjects. There is no single word in these volumes to call up a blush or a frown on the cheek of beauty and virtue. How pure, for example, is the following specimen, entitled

THE POWER OF LOVE.

> No damp that mortal reason throws
> Can quench true love's celestial beam;
> For ever on the breast it glows,
> And freshens still in memory's stream.
>
> Through all the varied scenes we see,
> Through all the joys and toils we share,
> However coloured life may be,
> The tender tint is ever there.
>
> Do time and space at distance fling
> Love's weakened hopes, though faintly fed?—
> Still to the dying heart they cling,
> And drop not till the life be dead.

Not less pure and finished are the following lines, in advice to one who complained of unrequited af-

* "Lyra Urbanica," (The Urban Lyre), by Captain C. Morris. 2 vols. Richard Bentley. London, April 1840.

fection. The stanza placed in italics seems to us exquisite.

What can I say to mend thy fate?
Thy spirits how replace?
How ease thy breast from sorrow's weight,
And brighten nature's face?
Man's only art is to persuade
With reason's chastening power,
And well I know its feeble aid
In passion's anguished hour.

'Tis not on earth thy hope must rest,
But from above must flow;
That magic cordial for the breast,
Man cannot mix below.
Turn, then, to Heaven thy aching brain;
Implore a grace divine;
Rave not at what the fates ordain,
Nor doubt their just design.

Soft is the trust and fair the plea,
When sorrow seeks the skies;
And sweet the holy hope must be
From power where mercy lies.
The hand that binds can 'like restrain
Thy darken'd bosom's strife,
And throw around thy days again
The light of joy and life.

Already, we believe, the reader will be disposed to admit that Charles Morris was no common table-poet, many as were the effusions—too many, certainly—which he dedicated to convivial matters. But what pleases us most about these volumes, is the fine, healthy, happy spirit of the old man, who cheered his declining years with the harmless society of the muse. The subjoined piece is a specimen at once of this spirit, and a remarkable proof of the entirety of the writer's faculties in his octogenarian days.

THE BARD'S SPECULATIONS.

I'm now turn'd of eighty,
But not dull or weighty,
Though fancy perhaps more in shade is;
I've spirits yet strong
For a glass and a song,
And a gay little muse for the ladies.
My rusty old croak
Father Time has not broke,
Though foe to sweet singing's profession:
To the harsh and the rough
He seems tender enough,
And has left me most ample possession.

Perhaps, ne'er before
You saw one of fourscore
A fanciful light-hearted fellow;
But I've liv'd from my birth
'Mid the blossoms of mirth,
And they are not yet faded and yellow.
Spleen's pestilent shade
Never cover'd my head,
In a world where there's friendship and beauty;
And this mixture to soothe,
Turns all rough into smooth,
And sweetens my heart in its duty.

The best prize that I know,
In life's lottery below,
Is to scorn all lamenting and whining;
Whate'er be our lot,
To taste well what we've got,
And sin not by thankless repining.
This was ever my creed,
And you'll see here indeed
A strong proof that it's pleasant and healthy;
Here I sit, as appears,
Where I've sat fifty years,
And outlived all the woeful and wealthy.

Such is the cheerful strain in which the veteran sang at eighty. The following verses are in one respect even more remarkable, being part of a still more recent Address to the members of the Beef-steak Club of London, a society including, in spite of the odd plainness of its designation, many of the most distinguished men of the day among its members. This club, of which Captain Morris was long an ornament, begged him, "then on the verge of ninety years of age, to appear once more among them before he quitted the world." He not only did so, but showed by his verses on the occasion that the muse which had so long enlivened their board was not yet dumb.

Well, I'm come, my dear friends, your kind wish to obey,
And drive, by light mirth, all life's shadows away;
To turn the heart's sighs to the throbbings of joy,
And a grave aged man to a merry old boy.

So he commences, but mixed emotions crowd on him as he proceeds:

When I look round this board, and recall to my breast
How long here I sat, and how long I was blest,
In a mingled effusion, that steals to my eyes,
I sob o'er the wishes that life now denies.

How many bright spirits I've seen disappear,
While fate's lucky lot held me happily here!
How many kind hearts and gay bosoms gone by,
That have left me to mingle my mirth with a sigh!

But whate'er be the lot that life's course may afford,
Or howe'er fate may chequer this ever-loved board,
Still the memory of pleasure brings sorrow relief,
And a ray of past joy ever gleams o'er the grief.

And still in your presence more brightly it glows;
Here high mount my spirits, where always they rose;
Here a sweet mingled vision of present and past
Still blesses my sight, and will bless to the last.

Thus sang the veteran at ninety. It is impossible to think hardly of this fine old relic of the past, though we may regret, to a certain extent, the manner in which he has applied his powers. But let those who peruse his convivial lays keep in mind the hearty ancient himself, and remember that, without practical temperance, he would never have tasted the health of mind and body which characterised his age—and then will all danger be obviated that might flow from the misinterpretation of his theoretical precepts.

With regard to his merely poetical merits, Charles Morris is a specimen of another age. The poets of our day cultivate imagery to the exclusion of sense and meaning. He has scarcely one similitude in his poems. He can be poetical both in thought and language, but his main object is to express himself pointedly and clearly, without any array of illustrative images or similes. He is the English Horace. Of modern bards, he most resembles Moore and Beranger, but is less polished in diction than either, though he equals them in terseness, point, and vigour.

OCCASIONAL NOTES.

"EITHER."

THE meaning of the word "either" has frequently been misunderstood by writers. Its proper signification is "one or the other," and we believe it is an abridgement of these words, in the same manner as "neither" is a contraction of "not the one nor the other." Notwithstanding this obviously true signification of "either," the word has often been used as a synonyme for "each." The translators of the Bible in the seventeenth century appear to have begun this misusage of "either." For example, they have written, "Nadab and Abihu, the sons of Aaron, took *either* of them his censer." It is quite clear that in this, as in other instances, *either* is used improperly, or in place of *each*. Hale and Dryden have fallen into a similar error, which, however, is so far from being checked by Johnson in his Dictionary, that from their misuse of the word he has given *each* and *both* as equivalent to *either*. Todd, the modern editor of Johnson, notices and condemns the error. Among careful writers of English, "either" has never, as far as we know, been misapprehended or misapplied; and it is only lately that a practice of substituting it for "each" has been conspicuous. In almost every work which has recently issued from the press, "either" has been misapplied. Such passages as the following are common: "the courtiers stood on *either* hand of royalty," "on a pillar at *either* side of the gateway," "the chairs were ranged on *either* side of the room," "castles frown from mountain peaks on *either* side of the river," and so on; in all which cases *each* is meant, not a choice of one or the other as the reader pleases. As there is a fashion in using words, this misappropriation of *either* will probably run its course, and be in due time restored to its correct signification.

THE PERRYIAN INK-STAND.

This is a remarkably ingenious and useful contrivance. Ink exposed in open stands, or stands with common lids, as is well known, soon gets thick, on account of the evaporation of the fluid particles, and hence fresh ink has to be frequently supplied. The inventor of the Perryian stand has completely remedied this rather annoying defect. His stand is a round glass of about two inches high and the same diameter, fitted with a flat brass top. In this top there is a small funnel, with its mouth exposed, and its lower point sunk in the ink within. Close by this funnel there is a knob, forming the top of a screw, and this screw penetrates below the cover into the empty space above the ink. By depressing the screw two or three twists, the air in the vessel is compressed, and so forces the ink to rise to the mouth of the funnel, where it remains for use. If we wish to make the ink disappear from the funnel, we have only to twist the screw in a contrary direction, when, the pressure being removed, it immediately sinks. Thus the ink is perfectly obedient to the action of the screw, and may be caused to remain at any height in the funnel, according to the depth to which we wish to dip our pen. When done writing, it is proper to lower the ink, and therefore when not in use it is no way exposed to atmospheric influence. We esteem this toy-like ink-holder as a curious specimen of the inventive faculty of the age, as respects the improvement of small comforts.

SUPERSTITION.

The following paragraph, from a late number of a Norwich newspaper, is offered for consideration:—

"The following act of barbarity and superstition is practised in this city. Children who are sickly are taken to a woman for the purpose of being cut for a supposed disease called the *spinnage*. The infants are on a Monday morning taken to this woman, who, for three pence, with a pair of scissors cuts through the lobe of the right ear, then makes a cross with the blood upon the forehead and breast of the child. On the following Monday the same barbarous ceremony is performed upon the left ear, and on the succeeding Monday the right ear is again doomed to undergo the same ceremony. In some cases it is deemed necessary to perform the ridiculous operation nine times."

We are informed by a private correspondent that it is not the lower classes alone who are chargeable with the above and similar follies. Last winter, a medical gentleman, on being called to attend a respectable family in the place, found that the children were about to partake of a *roasted mouse* as a cure for hooping-cough.

STORIES OF THE IRISH PEASANTRY.

BY MRS S. C. HALL.

"Mind not high things: but condescend to men of low estate."
ST PAUL.

DEBT AND DANGER.

PART I.

THE scene of our story opens in a venerable but decayed hall in the ancient family mansion of the O'Rourkes. A massive table of carved oak was covered or rather heaped with parchments, dog-collars, writs, new snaffle-bits, account-books, whips, spurs, letters opened and unopened, and various specimens of minerals. The pictures were covered with dust, as, indeed, was every thing in the room; and spiders mingled their tracery with the rich mouldings of the ceiling. The principal living figure in this melancholy scene was a young man, D'Arcy O'Rourke, who sat in the chair which his ancestors had filled for many generations. The only other character was Lanty Lurgan, the last retainer of the house, and the faithful attendant of his young master. What was the object of the young gentleman's thoughts, will be guessed from the following animated discussion:—

"I tell ye I must have it, Lanty."

"Well, but, masther, honey, wont ye listen to raison?"

"What has reason to do with the matter?"

"True for ye, Masther D'Arcy," replied Lanty Lurgan, with peculiar emphasis.

"Mind, then, that I hear no more about reason; but tell Murphy I'll pay him for the horse."

"*Whin*, Masther D'Arcy?"

"When it's convenient."

Lanty Lurgan shook his head.

"Hear me!" exclaimed the young squire, looking himself as angry as his good-natured handsome face would permit. "Lanty, you're not worth the toss of a bad halfpenny to a fellow."

"Maybe *not*," said Lanty.

"You've no management in you."

"Not now, sure enough, Masther D'Arcy," was Lanty's reply.

"What do you mean by 'not now?'" inquired his master.

"Just, thin, becase there's nothing left me to manage," said Lanty, having, before he made this declaration, taken the precaution to get at a sufficient distance from his irritable young master, to prevent any personal chastisement for his frankness, to which he had a particular dislike.

D'Arcy O'Rourke seized the bootjack that stood near him, and was in the act of flinging it at his old retainer as he half stood half crouched behind a high-backed chair; but, apparently struck by some cheerful reminiscence, he suddenly burst out into laughter. "Come out of your hiding-hole, old boy," he exclaimed; "come along; I did you injustice—for no half ruined vagabond in or out of Ireland had ever a more faithful follower."

"*I was born to it*," said the old man pathetically, while at the same time his eyes beamed tenderly on the thoughtless creature, whom, as a child, he had often carried in his arms; and pausing, he added, "God bless you, Masther D'Arcy; but whin ye smile, I think it's yer father stands *forenint* me."

"I wish to God he was alive now," observed the young man, earnestly. "He could advise me."

"He was always a fine hand at that," said the servant. "A mighty fine hand he was at the talking always; but, poor dear gentleman, he never practised what he *praiched*. Many's the time I've heard him tell that same Murphy's father, that wont let yer honour have the horse, 'Remimber, Mike, to keep out of DEBT; for wherever there's debt, there's DANGER.'"

"Agh!" said the young squire, "so he really refused you the horse, did he?"

"Bedad he did, sir."

"Lanty, did you say any thing to him about a bill at four or six months?"

"Plaise yer honour, I did."

"And what did the rascal say to that?"

"Plaise ye, Masther D'Arcy, he said it was no good, for the last you gave him has been renewed six times, and the horse is all he has to depind on for his rint."

"He lies!" exclaimed the young squire, rising; "it was only renewed three—no, four times."

The old servant shook his head.

"I tell you, Lanty, it was but four times. Look—once, of course."

"Ov coorse, that's only in raison," observed Lanty.

"Well, the second time was when that infernal scoundrel the wine-merchant made me pay for the pipe of claret that was drunk before I was born."

Digitized by Google

"A vagabone thrick, for sure him and his brother and his wife and children had always three months' pleasure, any way, for intherest (though it was always added on to every fresh acciptance), and the run of the house, and shootin' and fishin' in the *preserves*, which, God be good to yer honour's father, war *common* to the counthry, as long as they gave fair play and liberty to the foxes. Oh, he was the heart's blood of a scoundrel, to put an ould friend's son to throuble for sich a thrifle."

"Well, that was twice," said the squire, when Lanty had brought his reminiscence to a close. "A third time" ——

"Whin yer honour was in keepin'," said the old servant, seeing his master at fault.

"Ay, I remember that; that was decent of Murphy, for I was in trouble then, and he would not press me. I should have remembered *that*, Lanty," added the young squire, with one of those just impulses which spring up in every human breast; it may be to be instantly uprooted, or it may be to flourish. But with such as D'Arcy O'Rourke, the most common end is suffocation, from the pressure of other impulses of a more agreeable kind. "I should have remembered that, Lanty," he repeated, "and when I did not, you should have told me of it."

"Plaise yer honour, it's hard to get spaking with ye; whin throuble's plinty, why, thin, ye toss it away, though the best way is to look into it. *A bit of common paper often thickens into a parchment for want of attintion.*"

"Well said, old boy. The fourth time"——

"The fourth time ye pledged yer honour ye'd take it up that day three months!"

The colour deepened on the young man's cheek. "Well, well, there, never mind; I suppose, as usual, *he* is right and *I* am wrong."

"The fifth time, Masther D'Arcy," persisted the old servant, heedless of his master's peevishness, "the fifth time, ye may remimber ye had the money ready, but *you broke into it* to save James Sturgon of the Forge from ruin. Don't you *mind* it—his wife and the children was turned out, and the things begun selling, whin you saved them; and sure the hape of blessings you got for that same through the counthry has reached the heavens long ago. Even Murphy himself said, 'Well, Masther D'Arcy has the heart of an Irish king in his bussum, any way, though he did take *my* money to do it with.'"

"His money! What did the fellow mean by that?"

"Why," answered Lanty, with Irish sophistry, "he had but yer bills, sir, till the *fifth*, but *this* he had yer honour."

"I tell you what," said the squire, with the sad and most pernicious principle which the dangerous wit of a Sheridan stamped into an English saying, "I tell you what, Justice is a hobbling beldame, which, for the life of me, I cannot get to keep pace with Generosity."

"More's the pity," said Lanty, not understanding fully his master's meaning; "more's the pity, for Murphy had *depinded* that turn intirely upon yer honour, *and has never been the man he was since*, which is the raison of his refusing the horse. And by the same token the sixth time he was disappointed, his mother and wife war down in the fever, and" ——

"Lanty," interrupted the young man, almost fiercely, "Lanty, you are an old fool, and say things on purpose to torture me. But the spirit is down in me to-day, Lanty Lurgan; and any man might insult me who pleased."

"Thin, by St Patrick!" exclaimed the servant, with true Irish zest, "I'll take the horse for yer honour."

This violent outbreak, and strong language, roused the squire into a hearty laugh; but the boisterous mirth soon subsided, as it does—or more frequently changes into bitterness—when we have assisted at the formation of our own troubles; and he subsided into a deep fit of musing.

Lanty Lurgan was one of a class of Irish servants who, however privileged, never intrude. He could not bear to leave his young master, as he would himself have expressed it, "alone wid the throuble," but he had too much good taste to appear to watch his excitement; he therefore busied himself at the "far corner," "settling a place for the pet pups, the craythurs, that would be more natural in the kennel, only *it's fallen in*." And addressing a long confidential, and apparently interesting conversation, to their mother, an aged but beautiful long-eared spaniel called "Chloe," who, having had the luck to lose one eye, was entirely consigned to her maternal duties, ever and anon both servant and spaniel directed a sidelong glance towards their master, and then, as if by mutual consent, looked at each other.

The room and its occupants would have formed a mournful picture. There was the singularly handsome young man, seeming to all appearance more young than he really was, bowed down by the pressure of circumstances which he had then no means to alter, and which he had assisted in accumulating, without thinking of consequences that now weighed him to the very earth. His fine features were shaded by his hand from that light which he did not wish to witness his struggles, and yet their action was sufficiently marked by the convulsive efforts he made to restrain his feelings, which, though evanescent, were powerful in the extreme. The chamber, with its mingled furniture of the shreds and patches of old nobility, and the positive misery of the present, was in itself sadness; and the old servant, lingering like the last leaf of autumn on a blasted tree, was another link to bind the heart to the sufferer, whose misfortunes originated in the errors of his ancestors. Stung by some sudden remembrance more bitter than the last, D'Arcy sprang to his feet, and encountered the gaze of his humble friend.

"And you too, you watching me! I suppose you are bribed by my *good friend* the *sheriff*, or my kind friend Mr Driscoll the attorney. But I'll be watched by none of you, Mister Lanty Lurgan. I'll betray myself; I'll give myself up at once, and let the fag end of what was once the principality of the D'Arcy and the O'Rourke go to —— for ought I care. Only mind this, old man, I'll not be watched. Do you hear?"

"God knows I do, Masther D'Arcy; but how can I help it? Didn't I watch yer father from the first minute he made a *horse* of the big *dog* Bran, until I shouted for his coming of age, and joined the cry at his funeral? And didn't I watch you, God bless you! though you have scalded the heart in the ould man's breast, with raw and bitther words?—didn't I watch you in long-clothes, and out of long-clothes?—didn't I button on yer first jacket?—tache ye to load a pistol?—and drink a glass of whisky, before ye war ten years' ould, to the face of the Lord Lieftenant, whin he paid yer honour's father the visit—and didn't his lordship say he never see the like of it before? Didn't I go with ye to college, for fear you wouldn't be comfortable?—have I ever left you, by day or night, sleepin' or wakin'?—oh! Masther D'Arcy, havn't I been thrue to ye?—to be sure, I could not help *that*—and been fond of ye?—but I could not help *that* either! Ye may kill your poor ould slave, if you like, Masther D'Arcy, honey; but I can't help watching you—I can't, indeed. Wife and childre, and all, is gone from me off the face of the earth—all, but the *mighty* blessin', the masther's son. While there's light in my eyes, it will settle on you, Masther D'Arcy; and for no harm, sir—for no harm." The old man's voice faltered, and he turned to the window, weeping. In an instant the rapid current of his young master's feelings turned. Lanty felt the pressure of his hand upon his shoulder, and looked up; there was moisture in his large blue eyes.

"Lanty, forgive me—forgive me. I did not mean it; you can forgive me—can you not? I have no one to speak to here, now—no one who understands me; it seems to do me good to vent my feelings—it relieves my heart. If I could only give some of those law fellows a—a—good thrashing, I should be as happy and cheerful as a prince! that I should; but it is cowardly to vent my humours on you."

"I'd not hear yer inimy say that," said the old servant, smiling; "but abuse me to dirt, masther, honey, *if it aises yer heart*. I'd stand a bating, too, sir, if it would do you any good. What else are old bones like mine fit for?"

"No more of this, Lanty," answered his young master; "I am the wayward son of a wayward race, whose race is almost run. I despise myself, and am despised by others." "You are not," said Lanty.

"No one in the country would give me credit."

"Oh! that's another thing," said Lanty; "but they'd all give yer honour a *welcome*."

"Old Ireland always gives that."

"Thrue for yer honour; and whin this present debt and danger is got rid of, things will go on well again."

"Look at that table," answered the young man; "there are debts there that would swallow up half a dozen estates like mine. But the end is come!"

Lanty had so often heard the son, father, and grandfather say this, that he did not exactly believe it. The country had cried out at intervals that the D'Arcy O'Rourkes were ruined, during the last forty years; and so the old man wished to hope in spite of hope, and only said, "I'm sure, thin, yer honour would die game—keep the bailiffs off to the last!"

"I don't know—only this, Lanty; it was very bad of me to give a thought to Murphy's horse; I *hate* myself for it. I only wanted it, and, as usual, did not think; and that plan of long credit is always uppermost in a young fellow's mind, when *once he gets used to it*—it's our ruin. So tell him to keep his horse, and that I hope when he sells it he will take ready money, and nothing else. When I look back at the things I have done, the meannesses I have been guilty of, to prop not so much a sinking credit, but an extravagant habit, I feel as if I could shoot myself, or any man who did the same."

Opposite to where D'Arcy O'Rourke sat was hung one of those old carved glasses, wreathed around with flowers, Cupids, and bows. Dusty though it was, he could see his own reflection in the spotted and worn surface; there was the high, brave, manly brow, the bright blue eye, the noble form, the aspect and bearing of one who, if not born to fortune, could achieve it. Some sudden thought struck him at that moment, and he gazed earnestly upon himself. The resolve was made and taken; whether it was kept, the future will tell.

* * * * *

The cabin of Phelim Murphy, or, as he would have it called, the *house* of Phelim Murphy, was well built and comfortable for a house of its class. His youngest daughter was engaged in preparing a supper consisting of the usual potful of potatoes, which was slung on the iron crane that found refuge in the huge cavity of the chimney, so as to be on one side the fire, while over the burning embers was a bread iron griddle, upon which a large thick oaten cake was browning. Moreover, a tea-kettle simmered opposite the potatoes, and the presence of "the chaney" on a small table would have told any one acquainted with Phelim Murphy's *mendge*, that he and his wife and daughter had gone to market in the neighbouring town that morning, and were expected home to supper in a very short time.

Kathleen, the second daughter, had taken unusual pains with the arrangements; the "far table" was made ready for the two farm-servants and her brother, but the "*little* table" was prepared for the absent ones, who had doubtless undergone much fatigue. Kathleen having done all that was necessary, sat down on "the settle," and the old house-dog having curled himself round her feet, she began to hum over an old tune to the metre of a new ballad, until the repose of the room, which would have been stillness itself but for the hissing of the kettle and the chirping of the crickets, lulled her to sleep—the ready sweet repose purchased by labour and an untroubled spirit. Kathleen would, I dare to say, have slept on until her parents' return, had she not been roused from her slumbers by a sharp growl from her friend and companion "Gruff," and, suddenly starting, she saw Lanty Lurgan, staff in hand, standing before her.

"Oh, daddy Lanty, how you did frighten me!" she exclaimed. "Oh, how could you? But," she continued, looking into the old man's face, "but, daddy Lanty, what ails ye?—what's on ye, daddy dear? Sit down, sir. And, stay; take a drop of mother's cordial. What's with ye at all at all, daddy?"

The old man gulped down "the mother's cordial," whatever it might be, that the kind girl offered, and staggered rather than walked to the settle. "What's keepin' yer father, Kathleen?" he inquired.

"Sorra a bit of me can tell," answered Kathleen. "If they had come home whin they said they would, the cake wouldn't have gone to the bad, for he had this griddle mended, and wouldn't let mother get a new one at the big shop till he could pay down for it. I wish he *was* come, though, for you seem in throuble, daddy, and I don't like that. Whin did ye hear of the young masther, sir?" she added, coming close up to him; "and, indeed, though you war angry about the horse, sure it's what father could not help. We never can let Mr D'Arcy's throuble out of our mind whin we see the notice for the sale of the lands, and all, posted up on the chapel gate last Sunday was a month. I thought the life would have left my mother; and father, though he never spoke a word, had *heart* sorrow on its account, and could not bear to go near the house, only little Tommy (oh, daddy Lanty, that *is* the bouldest devil of a child that ever broke a sister's heart with his conthrary ways)—well, he went off afther flowers or something among the woods, and meets the young masther. Sure he'd threatened to send the dogs afther him many a time, but now he stooped down, poor dear gentleman, and patted his head, and gave him a silver shilling. 'Take it,' he says, 'for ye're the child of an honest man;' and whin Tommy danced home, flourishing his stick and shoutin' like mad, 'Hurra for the O'Rourkes, the ould kings of the counthry for ever!' and tould father, father laid his head down on the table, and I know he cried like a child. But Phelim Crane was here, and says that though the young masther has give up every thing, even to the watch in his pocket, he says if he was caught, he could be took and put in the jail—the devil raze it!—on account of one vagabond that has no heart in his breast. Now, Lanty, is that thrue?"

The old man said it was.

"Then thank God he's out of the counthry, though father does lose; but he wouldn't go forward with his claim at the latter end, *and many did the same, hoping the property would hould out to pay the large ones, and the masther get free*. Oh, Lanty! father sets the rights of things so before us, that though Mrs Myers has offered me credit for the pink gingham, and I havn't a *tack* to my back, I wont take it, because of the debt and danger! And, Lanty, I hope the masther did not lave the counthry in anger on account of the horse father refused him; that often is on *my* mind, Lanty, though no one thinks any thing is ever the matter with me, I'm so happy. Sure, whin I get the makings of a frock of that gingham, there wont be a happier colleen on Ireland's ground than myself."

"Poor child! poor child!" sighed the old man, and she could have echoed "poor Lanty!" for when her volubility was somewhat exhausted, and she looked and thought of the change which a few weeks had wrought in his appearance, her large grey eyes filled with tears; and the desire to relieve the sufferings of others, which is as common to the Irish peasant as the air they breathe, came upon Kathleen, and she overwhelmed the old man with questions of "What will you have?—another drop of mother's cordial, or a tumbler of father's *stiff* whisky punch? or, sure, daddy Lanty, I'll wet the *tay* for ye; and the cake is so nice and hot, with a bit of fresh butter." Then, in utter despair at the various shakes of the head that were given in reply to her questions, Kathleen clasped her hands together, and exclaimed, "Then, oh, my grief! is there nothin' I can do for ye, daddy Lanty, jewel, and ye looking so pale and poorly?"

"Nothing, Kathleen, only thank ye kindly; and sure the good man himself will be home in a few minutes any way, and it's wantin' him I am."

"And the masther, Lanty?" she inquired, lowering her voice, "have you heard nothing from him?"

Digitized by Google

"*From him?*" repeated the old man; "no, nothing!"

"To think of the likes of him being forced to fly the counthry through debt and danger," ejaculated Kathleen, earnestly; "but it's well it's no worse;—if he was caught! Only think of his being put in a prison, like a bird in a cage!—it would break my heart, so it would!"

"God bless you for that word," said the old man.

"Father *manes* greatly for him," continued the little maid, "but he says it's a great lesson to the counthry. And the other day, on the side of the mountain, where they war quarrying stones, my brother set on my father about a venture he meant to get up, and for which he could have borrowed the money asy. So my father made no answer until he took him up to the very top of the mountain, and then looking far over and away, he asked him to whom the bog and river and land belonged a hundred years ago, and he made answer, to the O'Rourkes and D'Arcys, who married into one; and then he pointed to where the wood had stood, and asked how it had been all levelled, and the birds that inherited it of the Almighty forced to fly *along with the four winds of heaven* to seek another home; and he said it was because of the debts gathered over it; and my father asked again, who had the lands now, and my brother said, the stranger and the cunning man. 'Ay,' went on my father, 'and the *money lender*; the *borrower* is banished from the face of the earth,' says my father, 'but the *lender* is established in his stead. We'll go on as we are,' says my father, 'not spending all we earn, but laying by all we can, and then putting out *our own* honestly. I well know the danger of debt, and the debt of danger. We'll learn to do without what we can't pay for, and give God thanks we don't owe the value of a brass farthing through the counthry.' My father has a saying," continued the pretty chatterer, "that debt is like a grain of mustard seed that springs into a great tree."

"He's a wise man," muttered Lanty, who was too much of the old school fully to value the wholesome doctrine, which, moreover, was given at an injudicious time. "He's a wise man, with a bigger head on his shoulders than a heart in his bussum, and that's what I dont like."

"That's not thrue all out," hastily replied Kathleen. "My father's head and heart are much of a size, thank God, and that's the blessing! And sure if he could have sarved the young master, he would."

"Ay, ay, when sarvice is not needed; there's many say that," muttered the old servant.

"I don't know what's come to ye," exclaimed the girl, bursting into tears; "but I'd take the bit out of my own mouth to give to him, and so would all my people, Lanty, in spite of yer bad words."

"Would you, though?" said Lanty. "*Do it then;* the young heart is not *desateful* like the ould. The masther isn't fled the counthry; Kathleen, *he could not fly;* he was seized with the sickness, and I hid him away from the vagabonds that would have laid him in his grave before this, if they had had their way. He was so beleaguered, he could not get off. But, avourneen, you'd pity him from yer heart. The spirit is so high in him, that he'd die before he'd let any one—I mane any of his own sort—know where he is, or how he is; and he's wantin' the little nourishments, which, God help us, his mother and grandmother, and great-grandmother, and every mother he ever had in the world, bestowed upon all belonging to them in the counthry—*sure they ever and always considered the poor their own people.* Yet he's made a resolution not to go on trust for any thing; though we're expecting money every day from an uncle he has, that's a general in foreign sarvice, to get him out of the counthry when the suspicion is over, and the coast clear, and he able; and, Kathleen, what I wanted to tell yer father was, that I'm afeard his bitther foe, Jack Cronan of Limerick, suspects he's not gone, from seeing me about, and is watching me when I go up towards the Black Abbey. Now, though your father's hard, he's honest; and as the poor masther never settled that ould thrifle of a bill about the last horses and things, that was renewed so often, why, those mane-hearted vagabones would think he was like themselves, and never suspect he was doing Masther D'Arcy a good turn. So I was thinking that you, I mane your father, would maybe"——

"Take him all we have on our bare knees, watch him and *tind* him, and save him, and get him out of the hands of his inimies at last, God be praised!" exclaimed the generous-hearted girl. "Oh, Lanty, I'll forgive you all you said. To be sure we'll put a blind on the law; and sure enough it's my father will manage every thing, and you only did him justice. But you said something about his wanting; shall I take him *mother's cordial*, and the *tay*, and the cake, and every thing in the house, at once? No one would suspect *me*, you know, Lanty; only, in God's name, where in the Black Abbey could you have put him away?"

"I'll give you the tokens, avourneen, whin yer father comes in; I could have got what he wanted, only for the waywardness he shows. And, besides, I *know I'm watched.*"

Not many minutes after this disclosure, the farmer, his wife, and eldest daughter, returned; and it would have been a lesson worth remembering to those who argue on the selfishness of human nature, to have witnessed the zeal displayed by those humble but warm-hearted people, in the cause of one who had injured them, but whose injuries were forgotten the moment his real situation was known.

"I thought you'd do the right thing," said old Lanty, while tears trickled down his cheeks; "there are many have the heart as good towards the masther, and maybe *softer;* but there's none have so much sinse."

It was arranged that Lanty should lie by for a couple of days, and that either Murphy or his daughters should convey what was necessary to the Black Abbey for the poor sufferer.

The country had not yet done talking of his imprudence, misfortunes, and rapid disappearance from amongst them. They could understand his extravagance and carelessness; but if they had known, they could hardly have comprehended, the sensitiveness and pride that would, independently of the circumstances which left no alternative between voluntary or jail confinement, have compelled D'Arcy to hide what he considered a dishonoured head in the depths of the grave, sooner than have it seen by his old associates. The storm had been even more desperate than he anticipated; and agitation brought on fever, which his humble friend had truly designated as "*the* sickness." To the services of poor old Lanty, D'Arcy O'Rourke had an undoubted right; but he saw his old friend sinking under exertions which were likely to destroy him rapidly. The only thing those of his obdurate creditors could obtain by detaining him in prison, was revenge; and this, as I *have* said, for debt, found no echo in the generality of Irish hearts. Many were the instructions Lanty gave Murphy as to what he was to say and do, when he visited "the masther;" that night his directions were particular indeed; one thing only he did not feel it necessary to recommend—perfect silence; he knew they would die sooner than betray their trust.

That night Murphy took down his gun, and, being amply provided with all things necessary, which his wife and daughters prepared with unusual care, departed on his mission. The good woman would not call her husband back for fear of "turning his luck," but she ran after to whisper in his ear, "that he was to remimber it was one of the *rale* ould stock he was going to, and to be very particular in his manners, especially *now*, as the dear gentleman was in sore throuble." This was in unison with the farmer's own opinion, and he was somewhat offended at the caution which his own generous feelings, clad in coarser garments, told him was unnecessary.

Many visions floated before him as he climbed the rocky acclivity leading to the Black Abbey. The footpath was wild and tangled. First of all he had to ford through a portion of that peculiarly Irish morass that adheres to the mountain side, then to spring from crag to crag, until, having attained the highest point commanding a view of the ivied ruins, which lay peacefully in a little dell sunk between two hills, he paused to consider what he should say. Murphy's salutation to friend or foe, to superior or inferior, would have been ready without thought, but D'Arcy was a combination of all at once. The national fealty to his landlord that had been, was combated by the severe loss and degradation he had endured from his reckless habits and broken promises. D'Arcy was vastly his superior in birth and education, but the upright and honest spirit, the firm purpose and taintless word of a free-born man, assured the brave tiller of the soil that those high moral qualities elevate the peasant, while their abuse degrades the peer. He stood alone under the canopy of heaven; the pale stars were "dreaming their path through the sky," the rabbits were gambolling in the moonlight, and the hoot of the owl ascended from the little valley, mingled with the honest bark of the distant dog. Murphy paused to consider what he should say. He knew what the ardent and fiery temper of the young man had been, and he had a shrewd suspicion that it would rebel against, not yield to, circumstances. He almost wished he had suffered his wife to come; for she certainly would have done nothing wrong.

THE DRAMA AN IMPORTANT AGENT OF CIVILISATION.

Dramatic performances and recitations are means of bringing the mass of people into a quicker sympathy with a writer of genius, to a profounder comprehension of his grand, beautiful, touching conceptions, than can be effected by the reading of the closet. No commentary throws such a light on a great poem, or any impassionate work of literature, as the voice of a reader or speaker, who brings to the task a deep feeling of his author, and rich and various powers of expression. A crowd, electrified by a sublime thought, or softened into a humanising sorrow, under such a thought partake a pleasure at once exquisite and refined; and I cannot but believe that this, and other amusements, at which the delicacy of women and the purity of the Christian can take no offence, are to grow up under a higher social culture. Let me only add, that, in proportion as culture spreads among the people, the cheapest and commonest of all pleasures, conversation, increases in delight. This, after all, is the greatest amusement in life; cheering us round our hearths, often cheering our work, stirring our hearts, gently, acting on us like the balmy air, or the bright light of heaven, so silently and continually that we hardly think of its influence. This source of happiness is too often lost to men of all classes for want of knowledge, mental activity, and refinement of feeling; and do we defraud the labourer of his pleasure by recommending to him improvements which will place the daily, hourly blessings of conversation within his reach?—*Channing's Self-Culture.*

[The above sentiments breathe a fine spirit of philanthropy, but we fear are quite visionary.]

THE FRENCH PRIEST.

[Abridged from a Sketch by Delaforest, in "Heads of the French, drawn by Themselves."]

THE nobility have resumed their titles, recovered part of their landed estates, and received, by a legislative enactment, a magnificent compensation for their losses; the middle classes, in their various grades, have gained a marked influence; but the clergy—ridiculed and prostrated in the eighteenth century, hated and persecuted by the Directory—have never resumed their influence. The position, fortune, and dignity of the French Priest, seem to have sunk for ever.

The calling of the Priest is not recognised by the civil law until he obtains the situation of vicar [or assistant to a curate], when he begins to receive an official salary out of the public purse. He is then considered a government officer; and as such, his annual salary is voted with those of all other public servants, from the king down to the last messenger; and a sum of twenty-eight millions of francs being divided between the thirty thousand persons that government condescend to keep in pay for the service of the church, each Priest's average income is under forty pounds a-year, and there is not one Priest for every thousand souls.

Thus a great number of Priests, not included in the official list, which begins by the archbishops, and ends with the vicars, must depend for their existence on their own personal property, or their scanty share of the small fees collected in the church they attend, which are divided by the vestry, under the superintendence of the curate of the parish. The immediate consequence of this inferior condition of the French clergy is, that their numbers are recruited solely from the lower classes, and from those poor but respectable families in which the young men, accustomed from childhood to hardship and privation, are prepared with more fortitude to bear the difficulties with which the Priest has to contend in his laborious career, under our philosophical laws, and in the present state of public morals.

Thus, also, it must be acknowledged, those free and spontaneous vocations which sometimes appear in the highest stations of life, being now above any suspicion of ambition or cupidity, are the more strong and durable, and command the more authority and respect. The Catholic church is disencumbered of those *abbés*, who had only the name and half the costume of the Priest; whose busts, fancifully sculptured, might be seen in the gardens of the nobility; who used to write tragedies when they could not write songs or operas: a kind of irregular troop, without leader and without pay, who, strangers as they were to the militant clergy, brought by their conduct inevitable disgrace on the cloth in the eyes of the vulgar and the ignorant. Delivered from these idle and perverted members, the Catholic church, as at present organised, prepares the young Levites, whom she brings up with care in her bosom, to the solitary and cheerless life that awaits them in the exercise of their calling. No one now thinks of railing or blaspheming against the Priest: it is no longer the fashion, and is esteemed vulgar; but, prompted by strong feelings of antipathy, or dreading the restraint his presence imposes, or, perhaps, wincing under the tacit censure conveyed by his example, people shun the Priest, and exclude him almost entirely from their domestic circle. Either through systematic religious indifference, or on account of their irregular habits, or in obedience to worldly prejudice, they never think of living on terms of intimacy with a man for whose assistance they apply on every important circumstance of their life, and who will be called to afford them spiritual comfort on their deathbed. Truth to say, the Priest is far from desiring admission to the pleasures of the social family circle—he would not enjoy them. He avoids mixing with society, because he perceives, beneath an apparent kindness of manners, prejudices, want of sympathy, and adverse feelings prevailing against him; and he will not excite or set them at defiance. The Priest's religious education has taught him, with humble resignation, to bear solitude, scorn, and all worldly tribulations; and, prepared as he is to live apart from a world that cannot do without him, he is ever ready to tender his assistance when required. Such is the situation, above the reach of prejudice, assigned the Priest in the social scale by the gospel and the moral code in all Christian countries.

The newly-ordained Priest who has no taste for tuition, or who is afraid alike of its advantages and its difficulties, is always anxious to perform his sacerdotal duties; and, after the Christmas consecration, his bishop appoints him resident Priest of some large parish in a great town. Let us follow him there, the better to appreciate the privations and the toils of the French Catholic Priest. His only income is composed of the tenth or twelfth part of the voluntary fees paid to the parish for the christening and commemorative masses (marriage and burial-service fees belonging exclusively to curates and vicars), and this precarious and scanty resource hardly enables him to provide the bare necessaries of life. He is obliged to take a lodging at the top of some decent but obscure house; a pallet bed, a table, and a chair or two, compose the

Digitized by Google

whole of his furniture; and if he has any attendance at all, he is indebted for it to the private feelings of some honest charwoman, who finds a compensation in the enjoyment of her charitable feelings for her insufficient wages.

This is not all. He will also visit the sick, the poor, the prisoners; and, however difficult he might find it to surmount the natural dislike inherent to humanity for scenes of wretchedness and misery, his sense of duty, of evangelical benevolence and heavenly reward, will not desert him in his arduous task. But who will not sympathise with the painful depression of a cultivated mind, obliged constantly to commune with children, women, men of the lower condition, whose intellect is hardly open to any light, who know not how to discern the acts of their every-day life, who are ignorant of the value of the words they utter—half savage beings, who do not even present, as a compensation for their stupidity, the stimulant attraction of a conversion to make, of a new civilisation to prepare? Who will not pity the mental torture to be endured by those constantly retold instructions, by that attendance to confraternities of religious old maids, by those unintelligible confessions, which form an essential part of the young Priest's duty, at the beginning of his professional career?

We shall not attempt to follow the Priest in the routine of all his professional duties, performing successively the christening, marriage, and burial services, our especial province being to observe and describe him out of church, in his connection with the world and society. After many years of trial, his merit, not unassisted by his family interest, or the patronage of some protectors, may obtain for him the appointment of vicar or curate; nay, perhaps he may be raised to the state of a vicar-general or a canon, become bishop or archbishop—and, as nothing is impossible, some future day may see him cardinal and pope. The Priest can always, we shall not say hope, but fear (which is more consistent with his humility) to be entrusted with the spiritual government of the Christian world. Brought up for all situations of life, he is prepared for all changes of fortune, and will bear them all with equal dignity: his habitual chastity, poverty, and resignation, give him a complete control over himself. Indifferent, but not selfish—charitable, without parading any outward emotion—observant, without malignity—silent, without being disdainful—and cautious, although he does not lack courage—he will appear irreproachable to the world; and he will rather abstain from mixing with society than engage himself too warmly in its conflicts. You will never hear of the Priest except when you want him; and be he poor or rich, in the lowest ranks of the church militis or among its highest dignitaries, he will be in close contact with every social crisis, without playing any conspicuous or offensive part. Has any one connected with the courts of law ever heard of a Priest appearing there as a debtor or creditor, plaintiff or defendant? We know only of two recent exceptions, and, unwilling as we are to recal painful recollections, we must say, that one of the men alluded to was not French, and that both had been attainted by the discipline of the Church before being found guilty by a criminal court. Still these two solitary examples, in our days, when all ears and all eyes are anxiously open to the smallest delinquencies of the Levites of the church, bear the most striking testimony to the high character of the French clergy, to which no other can be compared. One or two bad sheep in a flock of thirty thousand are hardly worth mentioning; and the united clergy of Italy, Germany, Portugal, England, Spain, and both Americas, cannot boast, like the French clergy, of the mighty assemblage of so many virtues, united to such exemplary dignity, poverty, and learning.

Buried now in a few legislative, municipal, and academic mummies, the spirit of Voltaire will no more invent and publish pretended misdeeds perpetrated by Catholic Priests. Calumny has made way for truth, and the newspapers are every day filled with descriptions of acts of courage, devotedness, and benevolence, accomplished by members of the Catholic clergy, whose example is in keeping with their best sermons. Here the archbishop of the metropolis, when a contagious fever is raging in Paris, can be constantly seen in attendance at the hospitals, adopting all orphans that the fatal disease throws upon his inexhaustible charity; there a young vicar plunges into the river, at the peril of his life, to rescue the insane or imprudent victim, whom he saves from certain death; another, braving the danger of a fatal conflagration, preserves the peasant's cottage, or the manufactory that gives employment to many operatives. Again, it is a Priest who throws himself between two combatants misled by a false sense of honour, and a sincere reconciliation takes place upon the spot selected for deadly contest. Every day, in fine, is revealed to the public some noble or generous deed accomplished by members of that class so long devoted to the calumnies of the press.

There is in this rapid sketch neither exaggeration nor poetry. Plain truth is told, supported by undeniable facts. We have shown the French Priest in his real character, without the servile and injudicious veneration of narrow-minded devotees; but we have also tried to vindicate him from the suspicion of hypocrisy entertained against him by all libertines. We have pourtrayed the Priest, not as he is misrepresented by silly people and slanderers, but as he is now—more the man of the times, more attentive to its wants, its signs, and its progress, than he ever was before, because experience and the calamities of the Church have not been lost upon him.

To sum up the social and distinctive features of the physiognomy of the French Priest, follow him from the seminary to the college chapel, to the barrack, on board ship, to the font and to the altar, to the deathbed of the sick, to the cottage of the poor, and the wigwam of the savage; observe him treading on the carpeted floors of splendid mansions, or visiting the convict in his cell, and accompanying him to the scaffold: you will always find him adapting his demeanour and his speech to times, to places, and to persons. The most characteristic trait of the French Catholic Priest—that which bears the impress of his peculiar education—is his disposition always to act with the most becoming propriety, his constant readiness to make sacrifices to every situation. It has been said with truth that there is always some virtue concealed beneath the rigid observance of propriety; and the Priest being the most perfect model of all sorts of propriety, he resumes in his life the practice, or at least the appearance, of every virtue.

NOVEL-SPINNING.

The following jeu d'esprit on the practice of *spinning* novels out to the length of three volumes, occurs in the New York Mirror for August 31, 1839:—

'A novel *must* be in three volumes. It matters not whether the author's story is long or short—his plot intricate or simple—his incident crowded or scarce—his characters few or many—in all cases his novel must be in three volumes. It is the publisher's fiat. If Richardson had lived in those days, he would have had to cut down Clarissa Harlow, Pamela, and Sir Charles Grandison, to three volumes each, and Goldsmith would have had to expand his charming little Vicar of Wakefield to the same dimensions. A tale in one or two volumes is deemed trivial, and in four or upwards cumbersome, and therefore no novel-writer, unless he be an established favourite, dares depart from the beaten track of three octavos or duodecimos. This gives rise to a systematic process of elaboration, which is a very great bore. Indeed, there is no end to the affectation and flimsiness of which it is productive; and an author is frequently obliged to wire-draw his scenes and thoughts in a way which is very afflicting.

The interrogation and exclamation are much in request, and special favourites with those who practise the art of spinning. Sometimes there is a good deal of ingenuity manifested in this department, and sometimes there is no ingenuity at all. The design is frequently too apparent—too barefaced; neither wit nor humour is employed to conceal the fraud. A gentleman's inquiries about little or nothing are numerous in the extreme, and his surprise about little or nothing painful and prolonged to a painful extent. For instance:—

"Were you at Sanderson's last night, Tom?"

"Yes."

"Crowded?"

"A regular jam! Whom do you think your false fair one, little Emily" ——

"Stuff!"

"Led off the ball with?"

"Oh! Watkins, of course."

"No."

"No!"

"Not Watkins!"

"No—I'll tell you—not Watkins."

"Harry Selbourne, perhaps."

"Wrong again. What think you of Fred. Thompson!"

"Pooh!"

"Fact."

"Nonsense!"

"'Pon honour!"

"Fred. Thompson!"

"Fred. Thompson."

"You don't say so! What *will* Sophy Tompkins say to that?"

&c. &c. &c.

Now, in place of such twaddle as this, to which plenty of parallels are to be found in our modern novels, would it not be equally instructive and answer the great object of filling the page just as well, to do it in this fashion:—

"————?"

"————."

DUELLING IN AMERICA.

The following is from the New York Spectator:—"We received a letter from a friend in the west, a short time since, from which we extract the following account of a duel, which, for novelty and brutality, the reader must confess, has not been surpassed:—

'Writing of their genteel and honourable mode of settling disputes, I will endeavour to give you a description of a duel which took place in a southern city not long since; and to do the narration justice, I must inform you of its origin. One night, a stranger—a tall, bony, and powerful man—stepped into the bar-room of a fashionable hotel, and swaggered about, to the no small amusement of the company. His dress was unique, being a coarse Petersham coat, deer-skin pantaloons, and heavy water-boots. His head was graced with a huge Mexican hat, with a brim half a yard wide. The butts of two large horse-pistols protruded from either pocket of his coat, and the handle of a bowie knife projected from under his vest. The strangeness of the man's appearance rivetted the attention of all present, and those who did not boast the bump of combativeness shrank from the swing of his giant arm. "I'm a gentleman," said he, by way of introduction. No one appeared to dispute it, so he proceeded. "I own three thousand acres of prime land, two sugar plantations, and one hundred negroes, and I can chew up any man in this room;" still no one disputed him; and looking round with a sneer, he exclaimed, "I've killed eleven Indians, three white men, and seven panthers; and it's my candid opinion you are all a set of cowards!" With this denunciation he jolted against Dr B——, a man of high honour and unquestionable courage. The doctor immediately threw the disgraceful epithet back on him, and at the same time spat in his face. The bowie knife of the stranger immediately glistened in the light, but the timely rush of several gentlemen prevented his plunging it into the heart of his opponent. Matters were soon brought to an understanding, and a formal challenge was given and accepted by the parties. Dr B—— was a thickset muscular man, and considered one of the best shots in the states; and even the arrangements of the duel did not shake his determination to humble the arrogance of the stranger. The terms were these:—The parties were to be locked up in a dark room (the seconds remaining outside), each to be stripped of his clothing with the exception of pantaloons, and the arms and shoulders to be greased with lard. Each had a pair of pistols and a bowie knife. At a given signal from the seconds, the butchery was to commence. The doctor, who survived the dreadful conflict, stated that for nearly a quarter of an hour they kept at bay, and scarcely a tread or breath could be heard after the cocking of the pistols. At moments he could see the cat-eyes of his antagonist; and when he was about to fire, they would disappear, and appear again in another part of the room. He at length fired: as quick as thought the shot was returned, and the ball passed through the shoulder. In his agony he discharged the second pistol at random; the flash brought a return from his opponent, and another ball passed through the fleshy part of his thigh. Faint with the loss of blood, he staggered about the room, and at length fell heavily upon the floor. The stranger chuckled when he heard the noise of his fall, but soon became silent, and slowly and softly approached his victim, with the intention of dispatching him with his knife. This, however, the doctor, with much presence of mind, though barely alive, prevented; for the grey eyes of the stranger betrayed him; and while they glared like fireballs over him, he struck his knife upwards, and it went through the heart of his antagonist, who fell by his side without a groan. The door was then opened, and the duellists were found weltering in each other's blood.'"

[Such is the feebleness of the executive in the western and southern parts of the United States, that proceedings of the above horrid nature cannot be checked.]

DUKE OF WELLINGTON AND SIR JAMES M'DONNELL.

A friend has related to us an anecdote illustrative not only of the high opinion entertained by his grace of this distinguished general, but of the delicate generosity displayed by Sir James to a non-commissioned officer of his regiment. Some three years ago, the Duke of Wellington was waited upon at Apsley House by two gentlemen, who announced to him, that, as executors of the will of a deceased friend of eccentric habits, who had left L.500 to the bravest man in the British army, they called for the purpose of handing to his grace a cheek for that amount; being fully satisfied that in so doing they should religiously fulfil the duty imposed on them by the testator. The duke thanked them for the compliment they had paid him, but resolutely declined to receive the money, alleging that the British army contained many as brave men as himself. After several pressing remonstrances, his grace's visitors earnestly requested that he would consent to become arbitrator in the matter, and indicate the individual on whom the bequest should be conferred. To this appeal he acceded, promising, in the course of two or three days, to give the matter his consideration, and report to them the result. At the appointed time they again made their appearance at Apsley House. The duke received them with great courtesy, but assured them that he had found the task a great deal more difficult than he had anticipated. After enumerating to them the various battles in which he had been engaged, and some of the most striking feats of heroism he had witnessed, he suggested that, if they had no objection, he would make his selection from the battle of Waterloo, that being the last, the greatest, and most important action of the war. This point being adjusted, his grace proceeded to state, that Hougomont having been the key to his entire position, and that post having been defended not only with the most complete success, but with the most chivalrous bravery, by Major-General Sir James Macdonnell, who commanded there, he could point out no one so fully entitled to the legacy as that officer. The executors repaired accordingly to Sir James Macdonnell, and having acquainted him with the decision of the Duke of Wellington, tendered him the money. Sir James expressed himself highly flattered by so distinguished a mark of his grace's approval, and observed, that although he should not attempt to dispute altogether the propriety of his decision, yet, as he knew a man who had conducted himself with at least equal gallantry in the same battle, he must insist on sharing the prize with him. He then went on to say, that at one period of the day the French troops rushed upon Hougomont with such irresistible force, that the gates of the farm were burst open, and for a moment the fate of the position appeared doubtful, when a powerful serjeant-major of the Coldstream Guards, of the name of Fraser, assisted him in closing the gates, which they did by dint of sheer physical strength, upon the enemy. Shortly afterwards the French were driven back with great slaughter, and the fate of Hougomont was decided. Sir James added, that the Duke of Wellington had evidently selected him because he was able to make good a post which was a key to his position; and he could not, on the same principle, withhold from the gallant soldier who assisted him, at so critical a moment, in forcing out the enemy, his proper share of the reward. He would, therefore, accept the L.500, and divide it with Serjeant-Major Fraser, to whom he accordingly paid L.250 of the money.—*United Service Journal.*

NUMBER 435. SATURDAY, MAY 30, 1840. PRICE THREE HALFPENCE.

EQUALITY OF HAPPINESS.

THE notion that happiness is pretty equally distributed throughout all ranks and conditions, is of old standing. Something of the kind is to be found in Homer :—

> "Two urns by Jove's high throne have ever stood,
> The source of evil one, and one of good;
> From thence the cup of mortal man he fills,
> Blessings to these, to those distributes ills;
> To most he mingles both :———
> The happiest taste not happiness sincere;
> But find the cordial draught is dash'd with care."

The same view has been taken by Mr Hume, and much can be said in favour of it. If we regard the class apparently most pampered by fortune—the rich and honoured—we certainly find that they have their cares and vexations, and these not merely what all are subject to by nature, but many of them incidental, as it may be said, to the very possession of wealth and honour. The necessity under which wealthy and titled persons lie, of acting up to the character which their possessions assign them, is not the least. Rank is to be supported, not only by the appropriate expenditure, which it may be difficult to provide, but by certain suitable or supposedly suitable modes of behaviour, which it may be very uneasy to sustain. How often have the great been found glad to lay aside their state, when they could do it with safety, to mingle in common crowds and common enjoyments! Even so far to indulge nature as to have a hearty burst of mirth, after being long restrained within the limits of a tame decorum, would often be to them amongst the most desirable of luxuries; but it is one which they perhaps more rarely enjoy than even the humblest orders of society. A grand dinner, ushered in by many foregone flourishes of trumpets, and with vast pageantry, in honour of some distinguished character, is an imposing spectacle, but one, that often, we suspect, yields more solid enjoyment to the spectator, or unknown guest, than to the chief performer, to whom it sometimes turns out to be rather of the nature of a mockery than of a feast. A patriotic statesman, successful warrior, a thrice-returned member of parliament, a lord provost, or lord mayor elect, is to be glorified; but how purely aërial must be their indulgences, knowing that they are the "observed of all observers, the admired of all admirers." On them all eyes are fixed; on their tongues all voices are hung. Can they eat, can they digest, under such a concentration of gaze and interest? Can they taste the flavour of the viands or of the rich wines set before them? Might not any thing almost be put on their plates, or poured into their glasses, which they would unconsciously swallow? Their attention is absorbed by the scene around; their ears are erect to catch the plaudits, or, perhaps, a stray sneer or disparaging whisper; big drops of perspiration exude and cluster on the forehead; the nostrils distend, the breast heaves, they breathe thick, short, and with difficulty; sighs and even groans escape, evincing the throes they endure in simultaneous efforts to eat and drink, smile and be gracious, and to keep in due order and connection the sentences of thanks to be shortly forthcoming in return for the "undeserved and unmerited tribute—the proudest epoch—the happiest moment of their lives, to which they shall ever look back, with the deepest gratitude and most unbounded satisfaction, to the latest hour of their existence." Exhausted by this delivery, the exhibitant sinks back into his chair like a discharged leech, collapsed and spent, sick and disgusted, until perhaps a glancing thought crosses his mind of the pure air and undisturbed repast to be enjoyed in some sylvan villa, which administers a cordial to his sinking energies. Such a banquet is called a public dinner, inasmuch as a multitude pays for it, and it is eaten for the public benefit; but a public sacrifice would frequently be a more correct designation.

The great have some title to indulgence, if not commiseration. A king has great power, but less liberty than the meanest of his subjects. His costume, his residence, his locomotion, his servants, his associates, his consort, all that constitute the pride, the free-will, and unrestrained licence of others, are ordained and prescribed to him by the law and his station. In theory, a monarch can do no wrong; in practice, he can do nothing right, nothing that is not obnoxious to the censure of some of the multitudinous host who sit in judgment over all his actions, and to whom he is in some degree accountable for his every-day conduct. All those next in rank and authority under him, his peers, ministers, judges, and great officers, down to the worshipful mayor, recorder, and aldermen of a municipal corporation, are in corresponding vassalage—subject to like responsibility, to like stringent conditions, as the price of official eminence. They live not for themselves, but the community; their lives are in the public breath—an afflatus, which, more than any of the gases which chemistry has discovered, is the most vaporous, elastic, evanescent, and inconstant. No salary, no fees, patronage, perquisites, or honour, appear an adequate compensation for living so dependently, and being made so fixed a mark for all the arrows which prejudice and malice may be pleased to discharge. If one reflects that the greatness of some is not sought, but thrust upon them; that many inherit offices hereditarily, like the sovereigns of England or the sheriff of Westmoreland; that many, again, have been thrust upwards by the ill-judged vanity of their parents or guardians, who preferred tinsel distinction to real happiness; and that others are the cadets of noble houses, in virtue of which, and in relation thereto, they are fixed in high places—

> ———Cursed and stigmatised by power,
> And raised to be exposed—

without aptitude, taste, or fitness for promotion; we shall find abundant topics calculated to console the more humble and less ostentatious, who "pursue the noiseless tenor of their way in the sequestered vale of private life."

The late Lord Castlereagh used to compare public office to a "bed of roses;" there were gay colours and some perfume in it; but the thorns were sharp, and sometimes annoying, as his lordship, so fatally to his own peace, unhappily found them to be.

The drawbacks from riches are not less than those from station, and the luxuries they purchase are not always sweet or wholesome. Nothing is so fascinating to the careless beholder as a splendid well-tasselled and well-cushioned equipage; it is certainly a great protection from night air and bad weather, though its necessary uses in most situations are now tolerably well provided for at less care and cost by cabriolets, omnibusses, and other vehicles; but it has more serious disadvantages than expense, or taxes on liveries, four wheels, and pleasure horses. Carriage people, we guess, are not remarkably healthy, nor do they appear, in passing, particularly happy; they lack the brisk respiration and cheering exertion of the pedestrian, in whose recreative pastime they are denied full participation, either from want of practice on common roads, or the interdict of fashion. Where a carriage, moreover, is kept, there must be such an observance of times and appointments, the health of horses, and so forth, as materially must subtract from that very freedom of motion which the possession of the vehicle seems to extend. The commonplaces of all nations are eloquent on the cares which attend wealth, the contentions to which it gives rise, and the vices of which it is the root. Unquestionably it often produces more irksomeness than pleasure, sets those by the ears who otherwise would have been friends, and, worst of all, corrupts the nature of him to whom it flows most freely. Another of its evils has been less remarked upon, the necessity which it imposes of acting according to the will of others, rather than one's own. Expectations are formed of the wealthy, as of the titled man. He must be generous to the degree, and in the modes, and with reference to the objects, which others choose, or submit to be thought a remarkably bad dispenser of the gifts of Providence. He is perhaps expected, merely because he has the pecuniary means, to practise hospitalities, for which he has little of either patience or taste. Whatever he does or gives, it is measured against the imagined standard of his wealth, and, as it is thought equal to, or short of *that*, so is he reputed. Even his ordinary charities are liable to be miscalculated, each recipient knowing well what he himself gets, but not how many others are getting or have gotten, or how much in all is dispensed. In short, the rich man is called upon in a thousand ways to concede to the will and expectations of others, and finds that it is much easier even to perform the task of making money, by men supposed so difficult, than to spend it in such a way as may be consistent with his own peace of mind, and, what largely contributes to that in most natures, his good standing with his fellow-creatures.

If we look, again, at the more conspicuous evils of life, we shall find that they are attended with some counterbalancing advantages, which make them not quite so great evils as they at first seem. The humble are not required to act up to an artificial character; and when subscription-papers go about, the poor are never expected to subscribe. Whenever they do clever or generous things, their merit is, to use Johnson's phrase, "handsomely acknowledged," for such things are not expected of them. Mighty blasts which prostrate the great, pass harmlessly over the heads of the lowly; and, as Juvenal long ago remarked, the man without a purse laughs in the face of the robber. In a thousand ways, humble circumstances may be found both convenient and agreeable. They expose, it is true, to some evils; but from many others they directly procure protection and exemption.

Nevertheless, while there is probably truth in every one of the above propositions, we must look a little farther in order to see the whole truth. The blessings of life may be allowed to have their drawbacks, and the evils to have counterbalancing advantages; but we fear that little sincere conviction would be produced by any effort to show that all classes of men are, class for class, alike happy, and that rank and condition are therefore matters of indifference. Such arguments belong to a cajoling kind of philosophy which is sometimes practised towards particular classes, with, we should think, remarkably little real effect of the kind contemplated. It seems to us more manly, as well as more true, to say, that there is much genuine benefit to be derived from wealth, when it can be obtained without too great sacrifices. It procures many comforts, and above all things confers the inestimable happiness of becoming the means or instrument by which the woes of others are to be lessened and their happiness increased. It saves from many great dangers and evils to which the poor are exposed continually. It gives the glorious privilege, as the poet calls it—and a glorious privilege it is for all who can obtain it, though the reverse is no real

degradation to the helpless—"of being independent." Station, again, can never be unworthy of a generous ambition, since it also confers the power of greatly affecting for good the destinies of others, and, when attained, must in ordinary circumstances have the effect of raising the mind above sordid and degrading influences. With wealth and station there may be great cares and great harassments; but these are comparatively of rare occurrence, and those which most frequently occur are of a trifling kind, such as nothing but the absence of real and great evils could invest with any power of annoyance. With poverty and humility on the other hand, great evils are more frequent or more constant in their action—a scanty provision of even the necessaries of life, exposure to oppression and contumely, danger of disease which there may not be the means of remedying, and many others not less great. One melancholy fact stands on the records of the statists in proof of the greater exposure of the poor to the mishaps of life, that the value of life amongst them is less than it is amongst the rich; that is, that the number of deaths amongst them, reckoning age against age, is greater. It is also to be observed, that the distresses of the poor are much less avoidable than those of the rich. A rich man, if he finds his carriage troublesome, can lay it down. If he finds himself too much pressed upon by a circle of friends, he can cut himself out from it, and take refuge in any pleasant part of the country or on the continent. Most of the things which trouble him are only those habits of society which an independent man may dissent from if he pleases. Alas, however, for the griefs and pains which beset the lowly estate, where means are slender, and friends consequently few!

Men practically acknowledge these truths by the exertions which they make, each to acquire better means and superior station. It is seen in the eagerness of the labourer and artisan to obtain a small advance of wages or promotion to the situation of a foreman, as well as in the movements of higher men. And well it is that Providence has implanted this universal solicitude for something better, for, except by a continual miracle, the blessings which that Providence has created for us could never have been otherwise realised.

STORIES OF THE IRISH PEASANTRY.

BY MRS S. C. HALL.

"Mind not high things: but condescend to men of low estate."
St Paul.

DEBT AND DANGER.

PART II.

Lanty had secreted his master in a small square underground chamber, not exactly a vault, nor yet a room; the air was admitted through a loophole at one side, on a level with the roof; it had been used formerly as a sort of resting-place for those who carried the coffins of the O'Rourkes to their last home; and two large stones, that occupied the whole of one side, marked the entrance to the vault of D'Arcy's ancestors. It had been inhabited for many years by a "holy man," who, after performing his penance of fasts and seclusion, disappeared from the country altogether about a year before the young squire's ruin. The entrance was then closed, as a child playing about the abbey had fallen in, and been seriously injured.

When Murphy entered, he could only discover at first a heap of old tapestry laid along three high-backed chairs, which Lanty had so arranged as to form a sort of couch for the sufferer; and the words, "At last, at last you are come!" were succeeded by a feeble movement; and while Murphy struck a light by the aid of his gun-flint, D'Arcy managed to raise himself on one elbow, and gaze wildly on his visitor, whom he now perceived was not Lanty.

"Don't come near me!" he exclaimed, "don't come near me! I know you now; but I'll never be taken alive; I've sworn it. I have lain all day watching these stones, and wondering if they would open for me. But don't come near me, Murphy. I suppose you *rods* here, eh? Well, some have horses, but others have none—but others have none!" he repeated wildly; while the farmer, overpowered by the sight, as he afterwards said, "of the brave flower of the counthry cut down and blasted," stood perfectly powerless opposite to him, the candle flaring against the walls, and giving just sufficient light to enable D'Arcy, when a little more cool, to observe the mingling of agony and pity depicted in his face, while tears coursed each other rapidly down his manly cheeks. The young squire then became alarmed for Lanty, and eagerly inquired if he had caught the fever, which gave Murphy an opportunity of explaining all in a few words. At first the young man was silent; but true generosity is infectious; it is a sort of signal-light, which, when lit up in one bosom, will communicate to the next, without any seeming contact. And, weak as an infant from disease, faint for want of sustenance, utterly and completely exhausted, the last of his race sobbed like a sick baby on the shoulder of the kind-hearted Murphy. "I wish it was my wife was in it," said the farmer; "I'm mighty unhandy about yer honour, so I am; and sure she shall come and tind yer honour, if you will let her."

"Don't 'honour' me, Murphy," said D'Arcy sadly; "I've no state left now."

"Ough, what matter?" he answered; "the state may go, but the honour lives in a man's own breast. I'd uphould it through the counthry, that it's *alive* there, any how; *and, plaise God, whin yer honour is out of the fungs of the fever, and the hands of yer inimies*, ye'll prove it. Give an honest man time to get through his throubles, and he'll prove he's honest—I'm sure of that."

"God bless you, Murphy!—God bless you!" he murmured. It was astonishing how, in a couple of hours, Murphy improved the aspect of the place. Lanty had brought some old carpeting and matting there by stealth, which had been thrown away as valueless, and by its aid the worthy farmer concealed the entrance to the vault, and managed to make a more comfortable couch. He kindled a fire, and contrived to keep it burning all night, despite the smoke, which, as the night was calm, escaped through the rugged entrance. The fire enabled him to supply his patient with warm tea during the watching hours. At times D'Arcy's mind wandered; but, in general, he was tolerably calm, though most anxious about his old servant. He talked to Murphy about the future, and his resolve to starve rather than go in debt—a resolution which the farmer declared would make a greater man of him than ever. And when the morning came, and Murphy was obliged to depart, the young squire experienced the benefit that is easier felt than explained, and which always succeeds a conversation with a person of strong mind, no matter how unlearned.

"I did not deserve this from you," said D'Arcy; "I did not think you would give it. Lanty knew you better than I did."

"He had a betther right, sir, being one of ourselves. *It isn't the likes of you, in yeneral, that understands the hearts of the poor.* But, sure, sir, dear, I have the honour of *sarving* you, and that's a rich reward for me."

It is rarely that one of Murphy's countrymen is so right-judging, rarely that he would be able to separate the giving the horse on credit to the young squire from the personal service rendered gratuitously, but the straightforward honest man had, as he well said, his reward; and while I give him due praise for his warmth and wisdom, I must remember that D'Arcy endured much; for to accept most generous service from one he had injured, was deeply humiliating to the tried and wounded spirit. Proud also by inheritance—a pride that had been both trampled on and goaded—if D'Arcy O'Rourke had been of a common mind, he would have taken refuge in his pride, gathered himself up therein, as in a mantle, and cultivated the idea, that being a lord of the soil gave him right over "his people," as I have heard them called, forgetting that the real law of landlord and tenant is an interchange of services, one having the gold coin which he exchanges for its value in silver, or it may be brass, yet still receiving the value. But D'Arcy's mind was not of a common or coarse order; he had persisted in the errors of his *caste* from habit, and a desire to keep up the dignity of his family, little dreaming that the man who runs in debt beyond his ability to pay, surrenders his peace of mind, and prostrates his dignity under the feet of his creditor. When awoke fully to a sense of his situation, his resolve was boldly and bravely taken; and though the nature of the cure was so severe that the patient might sink beneath its operation, still, if he survived, he did so in the genuine pride of conscious strength, in the enjoyment of that mental health which enables a man to look steadily forward to a given end, that end being HONOUR, the HONOUR of an honest man—the HONOUR from whose star a ray of glory expands on every side.

In the mean time, the report that "a travelling woman was ill of the fever in the Black Abbey, and that Murphy of the hill and his wife was able to see afther her without danger on account of the charrum," was industriously circulated, and obtained easy belief in a credulous district. Lanty, though suffering from severe illness, like the poor bird in the story managed to decoy the intruder from the cherished nest, and had the satisfaction of knowing that Cronan believed "the masther," if still in the country, was secreted some five miles off. This was all they desired, except, indeed, the recovery of the poor sufferer, which the undeviating attention of Murphy and his family accelerated. To Mrs Murphy's great relief, she discovered on her first visit that the young man had not been suffering from "*the sickness*," but from a fearful derangement of the nervous system, amounting almost to insanity—a nervous intermittent sort of fever. "Brain sickness' is not catching, any how!" she said joyfully to her husband. "I'm thinking that first of all to have it, honey dear, people must have brain; and you know," she added, smiling at her husband, "none of the Murphys have enough to *let loose* for that."

"Every kindness you show me," said D'Arcy, when he was sufficiently recovered to move about his narrow chamber, "every kindness you show me is like a dagger in my heart. I did not deserve it." He was always inquiring what was said of him throughout the country, and when it was likely he could leave it. It was interesting to observe what able tacticians both Murphy and his wife became, simply by the teaching of a kind heart. They let him know all that would be pleasant for him to hear, and avoided all that was contrary. At last they took advantage of the darkness of a summer night, and removed him to their own cottage, where the change of air and the additional comforts tended greatly to accelerate his recovery; but still he remained the shadow, the very shadow, of his former self—so worn, so weak, that he was literally unable to raise his cup of gruel to his own lips. They made his bed in "the loft," which was above the kitchen; and as the boards rested on the thick rafters, and there was no ceiling beneath, D'Arcy O'Rourke heard every thing that was said in the house; and to poor Mrs Murphy it seemed as though illness had sharpened his perceptions, for sometimes the neighbours would talk what she did not wish him to hear.

"Did ye hear, Mrs Murphy, that the new people at the big house are going to pull down every cabin on the red slip, near the cross-roads? Oh! the throuble must be heavy on the young squire, wherever he is, to think of the suffering he brought on the poor, by not taking care of his own." Or,

"Oh! dear, there's Tom Mulligan of the Forge gone altogether to the bad; he's fled the counthry, and they say his sickly wife, and the four grawls, must *take to the road*.* He was a thriving man in a small way, until the young squire gave him an order for the new iron gates, just whin he came of age; he thought *that* would make him, and *was in debt for the iron*. Sure, like every thing else, they were never paid for." Or,

"Sad news this morning, Mrs Murphy, ma'am. Mrs Nowlan died last night; she was always mighty tinder about the heart, and her little way of business was destroyed through the goings on at the big house. People, who maybe only wanted an excuse, said they could not pay her, because the squire never paid them. But she's gone now, any how."

Mrs Murphy tried all she could to keep these babbling tongues in order. Sometimes she told them to "spake aisy, for one of the girls was above on the bed sick." Sometimes she dismissed a neighbour with the information that she "had a power and all of work to do;" but though her eldest daughter, and Kathleen, both exerted their ingenuity to the utmost to keep the house quiet, they could not always succeed; and if the subject had not been of such an agonising nature, D'Arcy must have admired the strategems put in requisition on his account.

This was bitter schooling. He knew perfectly well that he had inconvenienced and distressed the rich, but he had not imagined that the influence of his own and his family's imprudence had so injured the poor. Those who had heaped blessings on his head as he passed along, and whose faces he knew even as his own, the more gentle and unpretending their complaints were, the more he suffered.

"Ah! sure, the poor gintleman could not help it; he'd have paid it if he had it, God help him!" Or,

"They say he's gone beyond seas. Well, betther luck to him, wherever he goes. Sure, the good drop was in him!—we know that. God break hard fortune before every one's child!" Or,

"Ah! it's not right of us to be so hard upon the poor young gintleman! What else could be expected from the way he was reared. *I'm sure, though we must eat our paytees dry this year through his manes*, I can forgive him; he did not mane it."

D'Arcy O'Rourke had often inquired why Lanty did not come and see him, and not one of the kind people who laboured so earnestly to minister to his wants could tell him that Lanty was breathing out his last faithful breath in a neighbouring cottage. Various excuses were made, the principal being, that "sure he was watching the post for his honour, and when a letther came, he'd bring it"—or, "he had hurt his foot with a splinter, and could not walk, and the people would be wondering if he was carried to the Murphys." The old servant had outlived "his people," outlived all his affections, save the strongest and dearest. The poor creatures where he was taken ill made up a little bed for him in a shed; that is to say, they gave him their own, and slept themselves on loose straw, for *self has no place in the heart of an Irish peasant*. Lanty Lurgan's sole comfort during the last days of his existence arose from hearing daily, through the medium of the benevolent Murphys, that the young master was better.

"I know I'm going, Kathleen, avourneen, I know I am. If I could only see the letther from his uncle, and look on his sweet face onst more, I'd die aisy; for what's done can't be undone now. The letther will come under cover to me, *for a cloak*, you know; and, sure enough, if I'm not in the world to receive it, what will he do at all?"

"Don't bother yerself, Lanty, honey, don't; you'll

* Beg.

be well enough by'n by; ye'll go with the young masther away; keep up yer heart; maybe the letther will come to-day or to-morrow," replied the weeping Kathleen.

"Yes, avourneen, yes; I will be well enough by'n by—bettther than ever, I know that, praise be to HIS holy name, who provides a place where the poor are made rich, and the troubled comforted—I know that! But, Kathleen, though the trees know that the spring will bring them fresh flowers, they keep on the *ould* ones as long as they can—it's nature, child. I *know* I shall see him *hereafter*, but still I want to see him *here*—just onst. I remember a poor ould setther of his father's, very ould intirely it was, and the baste had lost the use of its hind legs, and we wanted to end it; but the young masther would not hear of it, and had the ould baste brought up to a little room he had off his own, and, to plaise him, I used to tind ould Nero. And, 'Lanty,' he says to me one morning with his sunbame of a smile, 'Lanty, whin ye're an ould man, I'll tend you, my boy, as you have tended my father's poor dog,' he says; and I says, 'God bless you, Masther D'Arcy;' and I had hardly said the words, whin the baste comes staggering out of the little room, dragging its poor legs afther it, and I saw the dart of death in its two eyes, and I wanted to put him back, but the young masther wouldn't, and the craythur dragged on to his feet, and the masther put down his hand to coax it, like; and Nero put out his ould tongue and licked his hand over and over for more than a minute, then turned up its head with a shiver, and died. And with that Masther D'Arcy took his own forehead betwixt his palms, and I saw the tears drop, drop, dropping, on the dead dog. 'Let me take it away, D'Arcy, honey,' says I, forgetting to 'masther' him, for my heart was full; but he would not—only turned the head and closed the eyes of the craythur, as if it was a Christian.

'Masther,' says I, after a bit, 'will you let me die that way whin my hour comes; and will you do as much for me as you've done for Nero?'

And he grips me by the hand, and says, 'Yes, Lanty, God knows I will, and more.' 'I only ax as much,' I says. And Lanty added, 'If I could have as much, I'd die happy.'"

The next evening, when the Murphys were occupied as usual, some spinning, some knitting, and the men and boys looking to their cattle, or half asleep over the fire, a little child in the neighbourhood entered with the observation, "There's one without wants ye, Mr Murphy, sur." Murphy rose and followed his guide, and leaning against a tree that flanked the gable end of the house, was Lanty Lurgan, his great-coat flung over his shoulders, and his white hair and unshorn beard glittering in the fading light. The good man exclaimed that his visitor was mad, but a smile was his only reply—a smile so grim and ghastly that it made the farmer start; and then he drew forth a letter, and the words "it's come at last; just let me see and give it him," crept from between his lips. The farmer managed to employ or dismiss those not in the secret of D'Arcy's concealment, and then Lanty entered, without any assistance, beneath the hospitable roof.

"Oh, daddy Lanty!" exclaimed Kathleen, flying towards him; and then horrified at the expression of his countenance, so deathlike and wretched, she drew back, and observed to her sister, "That sure there must be something about him not right, for he wint up the ladder to the loft with a noiseless step, and the look of a spirit." The setting sun was throwing his farewell beams over the landscape, and a light of mingled yellow and red entered the loft through an opening the worthy farmer had "pulled" in the thatch to admit air and sunshine to the invalid. D'Arcy was seated on his narrow bed reading, or seeming to read, and his countenance, though pale, wore the expression of one who, having gone through the worst, is resolved to exert himself for the best. On seeing Lanty he started forward to receive him, and though judiciously apprised a few minutes before that the old servant was very ill, he was quite unprepared for the spectral appearance which, flinging off his hat, almost sank at his feet.

"It's come, masther!—it's come!" he muttered, extending the letter to his master; "here it is; and *I* brought it, and seen you onst more—*and seen you onst more!* There's money in it, masther, honey, and the coast's clear now, and ye can get clean off, and be a great man. Sure, yer young years have hardly blossomed yet! But, masther, honey, avick!—and they are a'most my last words—don't forgot *ould Ireland*, though the throuble came on ye in it; and ye war too high in yerself to be among your equals, sure ye did not want a humble friend. I'm a'most gone—and the distinctions of life are a'most gone—and all I can say *is*, it isn't the jewels on the hand that gives the charity we look at, but the *hand itself*. Give me a drink, for God's sake!—I'm chokin'; and, masther, honey, open yer letter. Sure I've kept ye from doing so long enough! Let me see ye open it!" he continued, while his master's eyes were fixed upon him with an agonising and intense gaze; "do—let me see ye open it. Ah! the Lord be praised!—though my own eyes are dim, I see it now—I see it all now! It's me, the poor Lanty Lurgan, yer honour's thinking of, and not yerself—I see that. *Isn't* THAT *life to my heart!* O! my joy! Look! I've lived many a day in the height of it, the 'debt and danger' I mane, until I thought I was used to it; but it broke the heart in me at last, even I, who was born in it—it's poisoned it is—it ended me; but you'll be out of its reach. I praise the Lord for that! and yet you won't, masther, machree!—the *body* will be, but not the *heart*, not the mind. Oh! my God!" he added, clasping his withered fingers together, until the bones rattled in the loose skin; "oh! my God! to think that while so many is dashing, and spinding, and striving for masthery—to think that all that time they are only *haping curses on their own graves!*"

"Oh! Lanty! Lanty!" exclaimed D'Arcy, "do *you*, too, reproach me?"

The old man started as from a dream, and, sinking at his master's feet, clasped his knees, and, while looking wildly with his glazed eyes in his face, answered, "Me! is it I!—me! Oh! may the heavenly powers forgive a dying sinner! Me!—did I!—did I!—'twas a *drame*, maybe, I tould; it *could* be nothin' else! It was a drame, I'm sure, masther—it was; but you'll forgive me. Reproach *you!* no, masther. Bless—bless—bless you!—may all the powers of heaven and earth bless you, my own dear masther!"

D'Arcy, greatly moved, moved even to tears, hung over his faithful servant, and endeavoured to raise him, but in vain; he continued to grasp his knees with the grasp of a dying man.

"Bless you, Masther D'Arcy; open the letter—do, dear. I can't see you now; *there's a mist betwixt* us, but I see yer shadow. I'm here—I feel your hot tears upon my cheek. Christ be praised, I've my wish! I'm like the ould masther's dog Nero. I'm dyin'—at—yer—feet—and you've cried—over—Lanty—the ould—dog of the family—and—that's—all."

It was indeed ALL—the old servant was dead, and D'Arcy O'Rourke lifted up his voice and wept. It seemed as though the grave of all dear things yawned at his feet. The old man had cherished even his faults; he had been his nurse, his playfellow, his friend, his slave. He had hoped to have taken him with him to a foreign land, but the hope had expired!—the warm true heart had ceased to beat; and, for the first time, when he, his master, called, there was no reply.

The letter contained a far more liberal supply than D'Arcy expected, and with the increasing and strengthening love of justice which was fast spurning all thoughts from his mind, the young man forced upon the Murphys ample remuneration for their trouble, and a small sum for several of the poor who had been overwhelmed by the wreck, which he frankly confessed the system pursued by his family and himself had created. "The time will come, if I live, when I will pay ALL," he added, when preparing to accompany the true-hearted farmer to the nearest sea-port, where his uncle had arranged that a vessel was to convey him to his destination.

"I'm sure of it, with the blessing of God," said Murphy. "And then, instead of ridin' out of the place in the grey of the evenin'—which, to be sure, is the pleasantest—yer honour will come in broad day *like a flash of lightning* in yer own coach wid four beautiful horses; but ye mustn't get married till ye come back, because a furrin wife might turn yer head from yer own land." "Hould yer tongue," said his wife; "what do you know about it? *wouldn't she love the land for his sake?*"

Each had prepared some "token for his honour"—a pair of lambs'-wool stockings, or a red comforter, or a pair of worsted gloves. "And now," said Murphy, when they got to the boat which had been some time in waiting, "I hope yer honour will accept the *baste* that brought ye down to the wather—it's own brother to Badger—and sure"——

But D'Arcy would not hear of this. He quitted his beautiful country and his friend in a silence more eloquent than words, and the last thing he saw through the clear midnight air of a moonlight night was Murphy kneeling on the shore, while his hands were outstretched towards the receding boat. When he unpacked his little valise, he discovered that all the *money he had given to Murphy for himself was folded in his best silk handkerchief!*

* * * * *

Years rolled on. The very old were dead, and those who had been young had grown grey, when it was rumoured about the country that old Murphy was giving money to a great number of people who had suffered distress in consequence of the ruin of the last of the O'Rourkes, a thing which had occurred before some were born, and when others were just beginning to go "their lone." Some said he visited the country himself, for that a large head-stone was put over a grave that the young had called "unknown" in the Abbey yard; it was only inscribed, "To the memory of Lanty Lurgan, a faithful friend."

There, however, was the stone; and some said a tall large figure had been seen kneeling by the grave. Be that as it may, old Murphy was called a "proud old man," chiefly because he wore a "goold" watch in his fob like a gentleman, which watch has some letters "printed" round it, which his children, grandchildren, and great-grandchildren, regard with peculiar veneration. It was only a few months ago that he inquired if the gentleman who had purchased the family house, with its more immediate estate, would part with it, which he seems inclined to do, for he also has suffered from the danger of debt.

"There's one wants it," said Murphy, when speaking of it; "one that's a *rale* hero. There was but one thing ever wrong with him, and in spite of every thing he got over it like a man. He's an honour to the counthry, for his trials have been bitther. He had, what might be called, TRIALS, which I *could* tell; but I'm grown ould, and have tould so many stories in my time, that, though this is every word true, maybe it wouldn't be believed. Only this I'll say to ould and young, rich and poor, bond and free, *Keep clear of* DEBT, *and ye'll keep clear of* DANGER!"

EDITORIAL NOTE.

The preceding tale concludes the series of Stories of the Irish Peasantry, which Mrs Hall undertook to write for our pages, with the patriotic view of improving the morals and general economy of her fellow countrymen, as well as of amusing and perhaps instructing readers among the humbler classes in Britain. How far the generous design of the accomplished authoress has proved successful, we have no opportunity of judging; but, from the extensive circulation of the stories in Ireland, and the manner in which they have been received in this country, we have little doubt that the result has been beneficial. In bidding Mrs Hall adieu, and offering her our best thanks for the pleasure she has bestowed on a wide circle of admiring readers, we are glad to know that she will still occasionally find leisure, if the state of her health permit, to contribute stories of a varied character to our miscellany. Meanwhile, as we learn, she is about to perform a tour in Ireland, along with her husband, with the view of writing a work generally descriptive of that country, and illustrative of the manners and condition of its people. As Ireland is now happily undergoing a rapid change for the better in its social aspect and character, and as it could not have a more zealous and impartial visitant than this excellent lady, we shall look forward with no small anxiety for the appearance of her work.

A very general wish having been expressed to possess Mrs Hall's stories in a volume separate from the Journal, for the purpose of still more extensive and effective dissemination, we beg to mention that the stories are now in the press in the distinct form required, and will immediately appear as a cheap volume in the "PEOPLE'S EDITIONS."

POPULAR INFORMATION ON POLITICAL ECONOMY.

THE NATURE AND USE OF METALLIC MONEY.

ONE of the most important of those popular mistakes regarding money, which we find to have existed before attention was directed to political economy, was probably this, that it was not, like other commodities, valuable for its utility, but that it possessed some intrinsic value in its mere nature, independently of its being put to use. According to more modern doctrines, the principal, and, in the opinion of some, the sole value of money, consists in its capability of acting as a means of exchange, an instrument by which the various commodities and other valuable things in the world are made to change hands when such a change is wished by their respective possessors. It has, however, uses incidental to this, which may be merely noticed in passing, that they may not interfere with the more simple view of the subject. Thus money is of use as a means of making a present or a bequest, *because* it is the grand medium of exchange, and will enable the receiver to purchase what he pleases with it. It is an article of commerce and speculation for the same reason, *because* it is used every where as an article of exchange, and so is a commodity for which there is always a demand. Having said so much to show that it may be viewed as possessing other elements of utility, let us now view it in its most important capacity as the universal medium of exchange.

The reason why it can be used as the medium of exchange is, because it is a representative of so much value in the various commodities which men wish to possess. A shilling is an article for which you prevail on your baker to part with a loaf of a certain size. The baker parts with his loaf for the shilling, because, when he has got that and some other shillings in the same way, he prevails on the shoemaker to part with a pair of shoes in exchange for them. The shoemaker, in his turn, acts upon the tailor, and so on. If the shilling ceased to produce the effect thus described, it would lose its usefulness, and with its usefulness its value.

But why should a shilling, because it is made of silver, have this effect, when a coin perhaps more elegant, made of gilt brass, will not produce the effect? For this reason: the shilling cannot be had without something of equivalent value being parted with to obtain it—the gilt brass coin could be obtained for something not worth a tenth of what is given for the shilling. If the shoemaker should consent to take gilt brass coins from the baker instead of shillings, the baker, instead of giving a loaf of a certain size, say a quartern loaf, for each, could make them or get them made at a much less cost, and the shoemaker would find that as they had not cost the baker the trouble of making so many loaves to procure them, so they would not be the means of procuring for him (the shoemaker) any commodity equal in value to the loaves. But suppose the baker, instead of giving five shillings in silver to the shoemaker for the shoes, should give him a piece of paper promising to pay that sum, or to give its value in bread, to the shoemaker, or any one he may commission—if the shoemaker believes that the baker will fulfil his word, this slip of paper is the same as money in his hands; it is a representative of value. If he has a neighbour who has the same opinion of the baker, the slip may be money in *his* hands too; and so it may be transferred from hand to hand. It is evident, however, though in the practice of banking such a system has been carried to a vast extent, that there must be a limit to its operation.

Digitized by Google

However well it may be made to suit the convenience of particular circles or classes of men, it is impossible that any kind of paper money could be the universal money of the world. As a fit instrument for this purpose, it was necessary that something should be found which should bear to every person to whom it might be offered, unequivocal evidence of its being a representative of value. A slight consideration will shew that this could only be attained through the medium of some commodity, which cannot be brought into existence without a certain uniform amount of trouble or labour being spent on its production. Gold is the substance which possesses this quality beyond all others hitherto known to exist; and therefore it has been, by the consent of the greater part of the civilised world, fixed upon as the principal standard of value. The peculiarities of this metal are, that it is extremely durable, and so the amount of it in existence is not likely at any time to suffer a sudden defalcation; it is met with in small quantities, and is produced by a very laborious process, affording but little profit to the worker; it is thus not likely to have its amount suddenly increased.

It is a very natural feeling, that of all the rich possessions which the bountiful lap of nature spreads forth for human enjoyment, the most to be coveted would be a mine of gold. Unfortunately, this view has not been confined to schoolboy visions; it has intoxicated many an adventurous capitalist, who has ruined himself by the search for gold. There is something that renders men delirious in the very word, and no mania has made more victims than that of working gold mines. Now, the very reason why gold possesses its value as a medium of exchange, is because the manufacture of it is an unprofitable trade. Look a moment at the production of another metal—iron; from 1824 to 1826, pig-iron sold as high as L.13 a-ton; in 1832, it fell to between L.4 and L.5 a-ton. Here we see that the demand for the article raised its price to the first-mentioned sum; while it continued at that price, enormous fortunes were doubtless made in the trade; then came competition, and the price sank to its natural level, or perhaps lower. Were there such fluctuations in the value of gold, it is needless to say how useless it would be as a general measure of value.

Perhaps the manner in which money is presumed to have come into use, may be illustrated by the following supposed case. Let there be a community consisting of four individuals, A, B, C, and D; A possesses so many sheep, B so many quarters of grain, C has clothing, and D has house-furniture. A wishes to have some of B's corn, and is ready to give an equivalent in mutton; but then he does not want so much as the value of a whole sheep, nor does B want to obtain so much mutton. Then there is D, who also wants both corn and mutton, but not so much of either as he would give a coat for; while the sheep-owner in want of a table would willingly give a sheep, or the equivalent of a sheep, for one, but the furniture dealer cannot consume so much butcher meat at a sitting, and would prefer having a shoulder of mutton, along with a peck of corn, in exchange for his commodity. Thus complicated and inextricable would be the intercourse in the barter system, even in such a small community as we have imagined. What is wanted to put an end to the evil is, some substance for a portion of which A will give a sheep, because he knows that for a proportional piece B will give any given quantity of grain, C a coat, and so forth.

Suppose we set one of the members of the community to discover such a medium of exchange, let it be C, the tailor. If it should occur to him that his friends will receive a shell with a peculiar mark on it, in exchange for their commodities, he will find himself very much mistaken. Suppose he should offer such an article to B, in exchange for a bushel of grain, B would laugh heartily, and say, "My good fellow, I can make just such another myself if it were of any use. So can neighbour A and neighbour D. I cannot expect, then, that they will give me any thing for it, so I can give you nothing." By this supposition it will be observed that C has been endeavouring to obtain something for nothing, for it is supposed that the shell in question neither cost him property nor labour, at least equivalent in value to what he wants for it. If he change his tactics, and offer something for which he has given labour or its fruit, he will perhaps be more successful. Let us bring a fifth party into the field, E. He knows of a means by which, with the expenditure of a certain amount of labour, a certain quantity of a substance called gold can be extracted from the earth. The substance is of such a nature that the supply of it always preserves (with variations almost imperceptible) an uniform ratio to the labour expended. But what occasion has E to produce this metal which will neither clothe nor feed him? None whatever, unless some one who will find an use for it will give wherewithal to clothe and feed him for it. Let us see if such an use be not to be found. Suppose now that C employs E to bestow as much labour as he will give for a coat, in extracting for him a corresponding quantity of the precious metal. If C go to B with a portion of the gold, and offer to exchange it for a bushel of grain, he cannot be met with the same answer which encountered his offer of the shell. The gold is not a thing which A and D can make as they want it, nor is it a thing for which C has not given value. It is true that B can procure it in the same manner as C did; but if it be convenient for him to part with the bushel of grain, he will prefer taking it from C at that price, as the more convenient way of getting it. Moreover, C may have already procured as much of the metal as the wants of the community demand; and if B, or any of the others, were to obtain more of it, they might have to dispose of it again as a surplus commodity. Let C take another piece of the gold and offer it to A for a leg of mutton. A knows that B has got a piece of gold, the value of another leg, which B will be in want of. In the same manner D comes into the market for another part of the sheep, and so it is disposed of, A possessing not the commodities he wants in return, but the means of procuring them. Here we have a circulating medium in miniature.

Now, it will at once attract the reader's attention, that though the community have thus obtained a very convenient article, they are not the richer from having obtained the gold; in fact, they are poorer, for they have parted with a coat to obtain it; they have, in fact, purchased a convenience. To a misunderstanding regarding this apparently very simple circumstance, much human misery may be attributed. It has too often been the feeling of communities, that, if they possessed gold, they possessed riches, and not a mere article for facilitating commerce—an article which, from its uses in this respect, is itself a commodity. The most startling illustration of this fallacy is to be found in the history of Spain. Before the working of the gold mines in their American possessions, the Spaniards were a rich and prosperous commercial people; but when they began to find gold, they thought they had got at their hand that for which they formerly laboured, and that, like a poor industrious man who has unexpectedly succeeded to an estate, they need now work no longer. To prevent their riches from disappearing, the law prohibited the exportation of the precious metals, and thus effectually shut the door against the only way in which they could be made sources of wealth—exportation as an article of commerce. In that view, and in that alone, was there any advantage in the possession of gold; and even had it been employed in the most advantageous manner, it would not have been so profitable as many other means of employing capital and labour; for, as already remarked, the peculiarity which makes gold so useful as a measure of value, is, that the labour expended in producing it bears so constant a ratio to the quantity realised, that but small profits are made from its production.

The manner in which the Spaniards became acquainted with the treasures of their transatlantic possessions tended to nourish the hallucination. They found a considerable quantity of gold in the possession of the natives, of which they speedily took possession. They found also a considerable quantity of native gold in the streams. Thus, by an accidental circumstance, such as that of finding a hidden treasure, they became possessed of money without working for it. They did not reflect that, if this lasted, gold would cease to be the representative of value which it was, and would be of no further service in commerce than as an extremely beautiful material for manufactures, which would fluctuate in value with the tide of fashion. When they could procure the mineral only by the result of hard labour, they still had the same preposterous feeling that they were possessed not of the means of making riches, but of riches itself, and dearly did they pay the penalty. While starvation desolated the land, and the highest grandees could not command so much of the produce of ordinary commercial industry as a glass window, every wretched dwelling glittered with mountains of plate.

"Several grandees," says Mr Dunlop in his Memoirs of the Reigns of Philip IV. and Charles II., "it is said, had twelve hundred dozen of silver dishes, and as many plates; and a nobleman was thought very ill provided who had not at least eight hundred dozen of dishes, and two hundred dozen of plates. These were generally ranged on enormous and lofty sideboards, to which the menials ascended by silver steps. The sideboard of the Duke of Albuquerque had forty silver ladders; and when he died in the middle of the seventeenth century, six weeks were fully occupied in weighing and taking inventories of the gold and silver vessels." At the period to which this refers, the Dutch, who were content to make their money by buying and selling the vulgar necessaries of life, were able to lend a considerable sum to the lords of the two Indies, which the possessors of bullion were unable to repay; and in another part of the work just quoted, we have the following view of the ludicrous poverty which haunted a court, dreaming that it was the source of the riches of the world:—"Money could be no longer raised for the most pressing occasions, however trifling might be the cost. Couriers charged with urgent and important dispatches on affairs of state, were often unable to quit Madrid, for want of the funds necessary to defray the immediate expenses of their journies. Some officers of the royal household having waited for payment of what was due to them, as long as they could, without absolutely reducing themselves to beggary, peremptorily demanded their dismission, and were only retained by force and menaces. All the grooms, however, belonging to the royal stables, who had not received their rations or wages for two years, contrived to escape from their service, and the horses remained for some time uncurried and unfed. A table which had been kept up at the king's cost for the gentlemen of the bed-chamber, was now *totally* unsupplied; and money was even frequently wanting to defray the daily expenses of the board of a monarch who was master of Mexico and Peru! The household of the queen-mother, which had hitherto been maintained at its full establishment, now began to feel the effects of the general destitution. The rations provided for her domestics were withheld; and on lodging their complaints at court, they were told, with a sort of Cervantic humour, that the royal coffers were now all standing open, and they might come to supply themselves."

This example is adduced, not only as a memorable instance of the pernicious consequences of the fallacy in question, but as an illustration of how far misunderstandings with regard to what seem very simple principles in this part of the science of political economy, may be productive of most direful evils. It is not here maintained that the possession of much gold is an indication of national poverty—on the contrary, it is, like all other expensive commodities, generally the concomitant of wealth. It may be strictly necessary, to a very large extent, for the uses of a rich trading nation; Britain at the present moment, though her bullion circulating medium bears but a small proportion to her paper money, probably employs more of the precious metals than Spain ever possessed; but, then, she uses them, and pays for their use, because she wants them, not because they are called gold and silver. Rich nations, too, like rich individuals, can afford to employ a considerable quantity of the precious metals for ornamental purposes, sacrificing a portion of their wealth in this, as in other articles of luxury. It is calculated by Mr Jacob that the quantity thus consumed annually in Europe costs L.5,612,711, of which England alone uses to the extent of L.2,457,221.

We believe that the fallacy we have been above attempting to expose, is now pretty well understood in its broader aspect; but such misapprehensions, when they have once caught hold of the popular mind, are not eradicated at once, and we fear that many fibres of the one in question are still pretty toughly rooted in society. It is still common to hold the doctrine, that a trade between two nations, in which the one gives bullion for the commodities of the other, cannot be profitable to the former. Such a trade has, we believe, never yet been exhibited on any very extensive scale; but were it to come into existence, a little consideration will show that there is no reason for presuming that it would be more disadvantageous to either party, than any other sort of trade. Gold is simply a commodity—a commodity which we import: and if we can export it profitably, why not do so? If the country in question will take nothing from us but gold, then it is either worth our while to buy gold for the purpose of sending to it, or it is not. If it is not worth while, then the trade will not be carried on at all. If it is worth while, then the trade is on the whole a profitable one. If we import sugar from the Spanish settlement of Manilla, and export it to Germany, this is called "the carrying trade," and quite correctly; but it seems to be thought that if we import gold from South America, we must keep our hands upon it, otherwise we shall be ruined. It is commonly said that we can only establish a profitable trade when we pay in our own manufactures. Now, paying in gold is, after all, indirectly paying with our own manufactures, for (except the comparatively trifling quantity that may have been taken in war) there is not an ounce of bullion in the country that has not been obtained in exchange for some article produced either by our manufacturing or agricultural industry. Let him who doubts this position try if he can discover any other method by which gold can have found its way to this country.

A steady trade, in which gold should be given on the one hand for goods on the other, is not to be confounded with those incidental and unexpected demands which create what is called a drain of bullion. These are generally occasioned by some disorder in the money market, the nature of which is frequently so imperfectly ascertained that it becomes a subject of vehement party discussion. But a drain may be also occasioned by a country finding it unexpectedly necessary to resort to some other community for a portion of the necessaries of life, such as grain. If the demand for the article were regular, it would proceed on the same terms as any other department of commerce. When it is sudden and unexpected, however, there being no previously established circle of trade in which the countries are included, the article as a single purchase must be paid for in hard cash; for the seller, were he offered manufactures, or any other commodity, would not know whether he could get them disposed of or not, and would be afraid to take them on hand. A drain like this, removing not merely the gold imported for the purposes of foreign commerce, but that which we have kept for our own use, may be productive of great and alarming inconveniences. It is the removal of the foundation of our circulating medium. The difference of the two cases may perhaps be illustrated in the operations of an individual merchant. With some of his customers he may have cross accounts; they buy from him, and he buys from them; and between them there is perhaps only a small balance to be paid in cash. There will be persons, however, from whom he buys, who take no goods from him in return, and these he must pay in cash. Is he a loser, however, by doing so? In the general case, certainly not, otherwise he would not

Digitized by Google

continue that line of business. He feels that the cash he so pays out is more than compensated by the money he receives from purchasers of whom he himself does not take goods. Thus the money he puts forth in the usual course of business is continually flowing back upon him. Let, however, some unforeseen accident make an incidental demand on his purse. Suppose one of his warehouses is burned down, and he must replace it. Here he parts with hard cash to some one who takes no goods from him in return, and with whom he cannot have a cross account; nor is the sum he has so expended compensated by other sums received from customers. It is, in short, a direct loss.

A WORD UPON ANTIQUARIES.

EVERY person remembers the famous discovery of the Prætorium by Jonathan Oldbuck at the Kaim of Kinprunes, and the manner in which Edie Ochiltree blew into thin air the grand superstructure raised thereon by the Antiquary, by revealing that the letters A. D. L. L., which Jonathan interpreted into *Agricola Dicavit Libens Lubens*, meant neither less nor more than "Aiken Drum's Lang Ladle;" and that the rude attempt at sculpture, which Monkbarns had determined to be a representation of a "sacrificial vessel," was intended as an emblem of the same Mr Drum's ladle, he being one of the celebrated "kale-suppers o' Fife." More recently, the author of the Pickwick Papers has described his hero as falling into a precisely similar error, a certain stone, marked in a very zig-zag way with the name of BILL STUMPS, having caused about as much speculation among the Pickwickians as the ladle of Aiken Drum did in the case of Jonathan Oldbuck. These stories are no doubt very amusing, and particularly that of Sir Walter; but the original story, that which gave rise to both of these suppositious incidents, seems to us much more amusing than either. It has one great advantage over them, inasmuch as it relates to a thing of *real occurrence*, a recorded and authenticated fact. We hope to raise a smile by laying before our readers the details of the affair to which we allude.

Some time in the sixth decade of last century, a rudely-squared stone, with an inscription upon it, was dug up on a desolate boggy heath in the county of Northumberland. It fell into the hands of the squire of the parish, who, not being able to make any thing of it, called in the parson to his aid, and many minute examinations, and profound speculations, were the result. But the divine, also, was obliged finally to admit that the interpretation of the inscription surpassed his powers. As in duty bound, however, he agreed with the squire in thinking that the stone was a treasure of antiquity, and, with the view of referring it to higher authorities, took an exact copy of the inscription, which stood as nearly as possible thus:—

K. RE P·O·N·T
H·I·S·S·I·D·E

Such was the inscription which the parson transmitted to the Antiquarian Society, with a polite request to have the opinions of the members thereupon. Much and long did these gentlemen ponder over this relic, which was unanimously admitted to be of great antiquity. Many were the debates which took place upon the subject, and ultimately the written opinions of the more distinguished members were recorded in the archives of the body, as well as published in the Magazines of the time. The first interpretation given in was as follows:—"On the first examination of this stone (said a member who signed himself X), I was not able to form any satisfactory conjecture concerning the inscription; but as the identity of the place where it was found ought to be materially considered, I wrote to a gentleman of the district for information, if there were any vestiges of antiquity, such as camps, fortifications, or the like, in the vicinage. In answer to which inquiry I was informed that there was nothing of this kind which he knew of, except the ruins of a priory about a mile distant. This is indeed sufficient for our purpose, and *clears up the matter* at once. *Clemens* [K·RE] *pontifex* [P·O·N·T] *hic jacet* [H·I] *sanctus* [S.] *servus* [S.] *dei* [I·D·E]. The second letter of the inscription is evidently an L, and the I·D·E a transposition of dei, from the ignorance of the sculptor; the meaning, altogether, being that the stone was erected to the memory of one Clement, a dignified brother in the convent. [Literally, 'Clement the priest here lies, a holy servant of God.'] Nothing can be more *plain and easy* than this."

But though the learned X was so well satisfied with his plain and easy solution, not so some of his brother antiquaries. Observe how Y, an equally distinguished member of the Society, trips up the heels of his predecessor X. "I never was so much astonished in my life (says he) as at the perusal of Mr X's solution of the inscription in question; what a forced construction! what a preposterous idea! . . I will grant him that K is often found on monuments of antiquity in place of C; but how, in the name of wonder, could he imagine the two following letters to be LE, which are plainly Æ. But the cream of the jest is I·D·E, a transposition of Dei!" We shall not trouble the reader with the remainder of Mr Y's triumphant sneers at the resurrection of the holy father Clemens. Y had actually travelled down to Northumberland to examine the locality for himself, and here is the new solution which resulted therefrom. "On a personal survey I discovered that the stone was found near an old Roman *military road*. Here, indeed, we have a light thrown on the subject, which will *clear up all manner of difficulty*. First K, often found in inscriptions for C, and here standing for *Cælius*—Æ, *ædilis*, an officer whose business it was to see the roads kept in proper order—P·O·N·T·, *pontem*—H, *Hadriani*, the same person who built the wall to prevent the inroads of the Picts, thence called Hadrian's wall—I·S·S·I·, *jussu*, the first u, and the former part of the latter u, being obliterated—D·E, *demolivit*. In all, *Cælius ædilis, Hadriani jussu, pontem demolivit* ['Cælius the ædile, by order of Hadrian, demolished the bridge'], when, by draining the morass, the bridge became unnecessary." To this there was a postscript added, stating, that "the priory which Mr X talks of seems to have some of the old bridge about its foundation."

Here was old father Clemens quietly re-inurned, and the priory, not precisely annihilated, but discovered to be a paltry thing of yesterday, with some of the very stones of the grand morass-bridge about its foundation. This was the "unkindest cut of all;" not only to overthrow the theory of poor X, but to lug in his priory so slyly, as a fundamental proof of the hostile hypothesis. But alas! alas!

"Oh wad some power the giftie gie us,
To see ourselves us others see us!"

Oh would we but remember the invaluable lesson of the mote and the beam! Y had scarcely produced his great refutation, and his equally great discovery, when lo! there "comes me in" a Z, who, with due alphabetical appropriateness, galls in turn the kibes of Mr Y. Of course Z perfectly agrees with his immediate predecessor in thinking the theory of the first riddle-solver, the unfortunate X, the "most ridiculous that ever entered into the head of an antiquarian."* Mr Z, however, thinks little better of the second supposition, and proposes a new one. It is a bold one, the boldest of all. "I have taken (says he) the most obvious and generally received meaning of the *initials*, and find the solution to stand thus: *Cæsaris ex edicto per orbem nuntiatur templum hic instauratum sacrum sibi ipsi dicatum esse.*" This profound solution, which has a word invented for every letter in the inscription, gives us the following meaning: "Through the edict of Cæsar, it is announced over the world that the temple here erected is consecrated to himself." Having thus cut the knot, Z exclaims, "Here we find Cæsar—after having, like Hercules, finished the greatest of his labours—after having extended his conquests over the Britons, usually called fierce and indomitable—erecting a temple on the limits of his ambition, and, flushed with victory, assuming the honours of a god! This is the *most easy and natural* construction, and perfectly consonant with the concise terms in which their inscriptions were generally couched. We need no other proof to convince us of the certainty of the fact; but, as a corroborating testimony, if we look into Horace, we shall find a passage evidently referring to this *very circumstance*—

The rank of god Augustus shall obtain,
With wild Britannia added to his reign."

We have a postscript added to this letter of Z, showing that he too had taken coach, or travelled post, down to Northumberland, on this mighty errand. "The stones (he says) which Mr Y mentions in the priory have a much greater resemblance to the remains of an old temple than the trifling ruins of a bridge, especially one which has the uncouth figure of a sword upon it." Poor X! Little did he imagine, that, out of the very foundation-stones of his priory, his two sharp-sighted opponents would build both a bridge and a temple, to the annihilation of his hypothesis. Such was the admiration, we must not omit to state, which the learned interpretation of Z excited among the members of the Antiquarian Society, that he was instantly and unanimously elected one of their number, an honour he had not previously enjoyed.

What a noble thing is learning! what a science that of the antiquary! Here, out of fourteen simple letters, we find monks and priories, bridges, ædiles, temples, and Cæsars, called into light and existence! Nor let the reader think that all these discoveries were vain and profitless. Referring to his own solution, Z triumphantly points out the great historical fact deducible therefrom. "What would a Camden or a Hollinshed have given to have traced the footsteps of Augustus Cæsar so far as the northernmost parts of the Brigantes [one of the divisions of the country under the Romans], or see him introducing the Roman temple into Britain!" The modesty, no doubt, of Z has forbidden him to notice a still more important historical fact deducible from his solution of the inscription. From it the world learnt for the first time that Augustus Cæsar ever was in Britain.

A feeling of pity and remorse seizes upon us as we approach the moment when it is incumbent upon us to blow up this magnificent edifice erected by X, Y, Z, and their fellow antiquaries of Britain. But the annalist of such important transactions must bow to the call of duty, and speak the whole truth. The labours of the venerable society became known ultimately to the inhabitants of the district where the stone was found. Among others, an old schoolmaster, there resident, was told of all that had been said and done on the subject. Unluckily, the snows of age, though they had whitened his hairs, had not frozen his memory. He revealed the appalling fact, that this great antique inscription meant nothing more or less than KEEP ON THIS SIDE, and that the stone inscribed with these vile vernacular words had been placed, within his own recollection, in the morass, by a benevolent cottager, who wished to preserve the passing traveller from danger, and whose will to do good greatly exceeded the powers of his chisel!

Was there ever a piece of solemn trifling equal to this! Never, surely, since time began. Universal Britain shook its sides when the schoolmaster made his unlucky disclosure, and it was long ere the antiquaries could hold up their heads thereafter.

* Z, by the way, affords the opportunity of remarking that *antiquarian*, though often used as a noun, is properly an adjective, and that the right word in this case is *antiquary*.

JOHN METCALF, THE BLIND ROAD SURVEYOR.

THE wonderful extent to which nature compensates the deprivation of one important faculty, by endowing the rest with additional acuteness, has been frequently the subject of remark. The particulars related in the following memoir strikingly illustrate this point, and show to what a degree the power of habit, and the exercise of good sense and ingenuity, are capable of overcoming seemingly insurmountable difficulties.

John Metcalf was born at Knaresborough, in Yorkshire, in the year 1717. His parents, though decent people, were not wealthy; and the greater was considered the misfortune, therefore, when, at the age of six years, while attending a district school, John was seized with the small-pox, and lost his eyesight in consequence. He had been noticed previously to possess good natural talents, but it was chiefly after the loss of his vision that he began to be thought a remarkable boy. Within a few months after that event, he had taught himself to walk about his father's doors nearly as well as before, and in a few succeeding years he could readily find his way alone to any part of Knaresborough. At the same time, he was accustomed to associate freely with boys of his own age, and became noted for his skill in climbing and other juvenile amusements. He also learned to ride, and grew so fond of that exercise, that he ventured repeatedly to follow the hounds of a gentleman of the vicinity, Mr Woodburn, who was very fond of his company in the chase. Swimming was another of young Metcalf's accomplishments, and he performed feats in this department which astonished every body. On one occasion, when two men were drowned in the Nidd, he was employed to dive for their bodies, and succeeded in bringing up one of them.

Music, the usual resource of the blind, was not neglected by Metcalf. Before he reached the age of sixteen, he had acquired such proficiency on the violin, as to be engaged as a performer both at Knaresborough and at Harrowgate, where he was much liked and caressed. It must be admitted that some of his favourite diversions at this period of his life were not of the most commendable kind. He became fond of cock-fighting, and kept a number of these creatures under his own care. This amusement divided his leisure time with bowling and riding. Strange to say, with the assistance of an accurate knowledge of the ground, and other helps, he grew very skilful at bowls, and could judge of distances so well as to come off frequently the winner. With his earnings as a musical performer, he bought a horse, and not only rode frequently in the hunting-field, but ran his horse for small plates at York and elsewhere. On one occasion he engaged, for a considerable stake, to ride his own horse three times round a circular course of a mile in length against another party. As it was believed that Metcalf would never be able to keep the course, large odds were taken against him; but, by the ingenious plan of stationing persons with bells at different points, he not only kept the circle, but won the race. His skill in horse-flesh (as the phrase runs) was astonishing, considering that the great faculty which determines the judgment of others was to him a blank. He actually made considerable profits by the purchase and sale of horses.

At the age of twenty-one, John Metcalf was six feet one inch and a half in height, and extremely robust in person. He was so lively in spirits, and so quick in his motions, that few suspected his want at a casual glance. Nor durst any one presume so far upon his defects as to ill-use or insult him. With his opponent once within his grasp, he could well avenge any injury offered to him. He even protected his friends against aggression, and in one instance acquired the thanks of every body, by inflicting severe chastisement on a noted bully who had misused one of his associates. Nor did his defect of vision prevent him from being a favourite with the fair sex. Between him and Miss Benson, the daughter of a respectable innkeeper at Harrowgate, a mutual affection sprang up, and notwithstanding that the lady's mother opposed the match so far as to get the banns published with another, Miss Benson remained faithful to her blind lover, and they were ultimately united in private. After his marriage he continued to perform during every season at Harrowgate, increasing his income by keeping a chaise or two for hire. Being indefatigable in his search for means of bettering the condition of his family, he also travelled, at intervals of professional leisure, to the coast for fish, which he brought to the markets of Leeds and Manchester. Such was his quickness and ingenuity, that no accident ever happened to himself or his horses on these journeys.

When the rebellion broke out in 1745, Metcalf's stirring spirit led him to join the English army as a musician, and he remained with them up till the victory of Culloden. He then returned home, but not until he had formed a plan of future employment from what he had learned—for we can scarcely say observed—in Scotland. He adopted the idea that a number of the cotton and worsted manufactures of the north would sell well in England, and accordingly he made one or two journeys back to Scotland for these stuffs, which he disposed of in Yorkshire. Among a thousand articles, he knew exactly what each cost him, from a peculiar mode of marking. Still this trafficking did not prove suitable for a permanent line of life, and in 1751 he commenced driving a stage-waggon, twice a-week in summer and once in winter, between York and Knaresborough. This employment apparently drew his attention to the subject of roads, and fixed him in the pursuit which finally gained him his chief celebrity, and proved a source of no slight advantage to his country. During his leisure hours he had studied mensuration in a way peculiar to himself, and when certain of the girth and length of any piece of timber, could reduce its contents to feet and inches, or could bring the dimensions of any building into yards and feet. In short, he had formed for himself accurate and practical modes of mensuration. At this time it chanced that a new piece of road, about three miles long, was wanted between Fearnsby and Minskip. Being well acquainted with the locality, he proposed to contract for it, and his offer was accepted. The materials for the road were to be taken from one quarry, and there, with his wonted activity, he erected temporary houses, hired horses, fixed racks and mangers, and set the work a-going with great spirit. He completed the road much sooner than was expected by the trustees, and in every way to their satisfaction.

Thus commenced the most remarkable portion of this man's life. Metcalf soon undertook other road contracts, and, strange to say, succeeded in laying down good lines where others were hopeless of success. In Yorkshire, Lancashire, Cheshire, and Derbyshire, during a period of nearly forty years, he pursued the employment of road-making and bridge-building, being by far the most noted and esteemed follower of such occupations in those parts. The large bridge at Borough-bridge, and various others, might be named as proofs of his abilities and success. An anecdote is told, which will exhibit the ingenious way in which he overcame difficulties which staggered other surveyers. Among the numerous roads for which he contracted, was one on the Manchester line, between Blackmoor and Standish-Foot. The original surveyor took the new line over deep marshes, which, in the opinion of the trustees and all concerned, seemed only passable by cutting or digging the earth till a solid bottom was found. This plan appeared to Metcalf tedious and expensive, and he attempted to prove to the trustees that such was the case; but they were fixed in their original views, and only permitted the blind road-maker to follow his own way, on condition that he should afterwards execute their plan if his own failed. Metcalf began to his task. The worst part of the line was on Standish Common, where a deep bog existed, which it seemed impossible to cut a road through. Metcalf set his men to work in cutting a line, and draining off the water, as far as that was possible. So little progress, however, was at first made, that every body laughed at the poor blind man, who, it was thought, would have given up the task in despair, had he had his eyes like other people. Nevertheless, he proceeded unwearyingly, until he had levelled the bog across, and he then ordered his men to collect heather or ling, and bind it in round bundles which they could span with their hands. These bundles were laid down close together on the cut line, and successive bundles laid over them again, after which they were covered and pressed down with stones and gravel. The issue was, that this portion of the road, when completed, was so remarkably firm and good, that it needed no repairs for twelve years, while other parts required frequent repairs. Even in winter it was perfectly dry.

It was Metcalf's custom, in making purchases of wood, hay, or stones, to span the articles with his arms, and then calculate the amount mentally. Having learned the height, he could tell with great accuracy what number of square yards were contained in a stack of grain, of any value between one and five hundred pounds. His memory was astonishing, and it was no doubt principally by this faculty that he was enabled to traverse so many towns, and ride along so many roads. While in York, on one occasion, a friend of his, the landlord of the George Inn, asked him as a personal favour to guide a gentleman towards Harrowgate. This place lay in Metcalf's own way, and he agreed to the request upon condition that his blindness was kept a secret from the gentleman. The pair accordingly started, both on horseback, and Metcalf taking the lead. By a little dexterity, Metcalf contrived to pass some gates without leading to a suspicion of the truth, and finally the travellers entered a forest beyond Knaresborough, where there was as yet no turnpike. Evening came on, and by asking his companion if he saw lights in particular directions, Metcalf brought the journey to a safe close, though in those days a man with all his eyes about him might well have strayed from the path. On landing at the Granby inn, the two travellers took some warm liquor, after which Metcalf retired. Having noticed some difficulty on the part of his companion in lifting the glass, the gentleman remarked to the landlord that his guide had surely taken drink since his arrival. "I judge so," added he, "from the appearance of his eyes." "Eyes! bless you, sir, don't you know that he is blind?" "Blind!" cried the traveller; "blind! gracious heavens!" "Yes, sir, he is blind as a stone!" Metcalf was called in, and his late companion, yet trembling with agitation, exclaimed, "Had I known your condition, sir, I would not have ventured with you for a hundred pounds!" "And I," said Metcalf, "would not have lost my way for a thousand!"

The nicety of touch which Metcalf had acquired was very wonderful. He could play at cards with no other guide; and when persons were by on whom he could depend, he frequently played for serious stakes, and won, through the advantage of his uncommon memory. Even when no friend was near him, it would have been very difficult for an opponent to have taken unfair advantage, such was his acuteness of ear and powers of observation. One occasion is mentioned where he won eighteen guineas from strangers at cards.

In the summer of 1788, Mr Metcalf lost his wife, who had brought him four children. He had before this realised a handsome sum by his road and bridge contracts, but he lost considerably in his old days by some cotton speculations into which he was led by his enterprising spirit. In 1792, he gave up his extensive engagements, and settled at Sposforth, near Wetherby, in his native county. Here, having retained as much of his fortune as to secure a comfortable independence, he spent his latter days in happy ease, in the bosom of his family. He died in the year 1802.

FORBES'S CEYLON.*

CEYLON is an island in the Southern Ocean, lying off the promontory of Hindustan, extending to two hundred and seventy miles in length, with an average breadth of one hundred miles, and a superficial area of 25,000 square miles. It is situated between 6 and 10 degrees of north latitude, and between 80 and 82 degrees of east longitude. Though situated so near to the equinoctial line, it enjoys a comparatively moderate climate, its small extent permitting the sea-breezes to traverse it entirely, and some of its mountainous ranges being of such an elevation as to supply the general surface with abundance of moisture. The island contains no natural lakes, but its rivers and rills are innumerable, and the early inhabitants had built many artificial reservoirs of great size, which have ever been of the highest benefit. The population is now believed to amount to 1,400,000. Rice, coffee, cocoa-nuts, with cinnamon and various other spices, form the staple produce of the Cingalese country. The sugar-cane has also been cultivated of late years, and pearl-fishing is one of the most lucrative occupations on the coasts.

From native records in the Pali language, a tongue bearing apparently the same relation to the vernacular Cingalese that Sanscrit does to Hindostanee, a pretty full account has been obtained of the history of Ceylon. A list of the kings, with an accompanying narrative of their chief acts, has been drawn up, extending over a period of not less than twenty-four centuries, or from about the year 543 before Christ till the present time. In all, one hundred and sixty-five sovereigns are found on this list. Like other eastern nations, the Cingalese can neither be said to have been civilised nor barbarous during the period in question, though they certainly retrograded rather than advanced latterly. They built extraordinary and magnificent edifices; but these, with striking though not uncommon inconsistency, were chiefly devoted to the rites of a savage and contemptible idolatry. Till after the middle of the eighteenth century, the Cingalese, though previously visited by Portuguese and Dutch traders and settlers, maintained their independence without difficulty. About 1780, however, the islanders quarrelled with the Indo-British powers, and hostilities then commenced, which continued with little intermission down to the year 1815, when the native king, a cruel despot, whose intolerable conduct precipitated the subjugation of his country, was dethroned, and the island added to the dominions of Britain, as what is termed a *crown colony*, with the consent of a large proportion of the inhabitants. The Cingalese, in short, underwent the fate which inevitably follows the struggles of barbarism with civilisation. Since 1815, Ceylon has been ruled by successive British governors, the present one being Mr Stewart Mackenzie of Seaforth.

The aboriginal people of Ceylon were the Veddahs, a tribe who yet live in a rude state in some districts of it. The name of Cingalese, or Singhalese, was derived from Singha, the ancestor of an invading race from Hindustan, by whom the dynasty of 543 B.C. was founded. At the same era, according to the native chronicles, the great Buddha died, who was canonised as the head of the old religion of the island, and in whose honour were erected the majority of the numerous temples, ruinous and entire, that are yet to be seen in the country. The Buddhist religion is still the prevalent native one, and this idol's relics are every where reverenced, as we shall have occasion afterwards to show from the work of Major Forbes. The Cingalese, like other oriental nations, are afflicted with the prejudices of caste. Excepting the royal one, the highest caste in the island is that of the land-cultivators, including the chiefs and great families. Trades-people and labourers form another; but it would be tiresome and fruitless to enter into details on this point, as each caste has many subdivisions, the limits of which are so strongly marked that even the individual branches cannot intermarry. The lowest caste, the Rhodias, were for ages so utterly despised and so cruelly treated, that they could not live in common houses, or own land, or approach a temple; and, lastly, they could be killed by any one with impunity. The British have done much to abolish this detestable prejudice. There existed no small degree of learning among the Cingalese, but it was almost entirely confined to the Buddhist priesthood. The community at large were very ignorant.

After this general account of Ceylon, we turn with pleasure to the details of Major Forbes's interesting work, which combines adventure very pleasantly with elaborate information, the fruit of many years' experience and observation. He landed on the island in the autumn of 1826, and continued there for several succeeding years, during which time he visited almost every locality on its surface, possessed of any interest or importance. The ancient city of Kandy, long the capital of the island, and standing very nearly in its centre, is described by him as of considerable extent, judiciously planned, and situated on an angular piece of ground, with the base resting on two large artificial lakes. Describing a part of the environs, Major Forbes says, "The course of the rapid Mahavilla-ganga winds below; the green hills and forest-clad mountains, rising to a height of upwards of six thousand feet, lie beyond; and this, with clumps of palmyra, tufts of cocoa-nut trees, and every variety of forest foliage," constitute the scenery close around Kandy. The chief native buildings are the temples of Buddha, of which the town contains several, and two colleges for the ordination of the Buddhist priests. There are also temples to the gods Nata, Vishnu, Katagramma, and others, whom the Cingalese worship as well as Buddha. They sacrifice, likewise, to demons, a *red cock* being the usual offering on such occasions. Major Forbes observes, that the doctrines of the Buddhist religion are certainly unexceptionable in many points, the fundamental maxim being as follows: "Abstain from all sin, acquire all virtue, repress thine own heart." But these lessons are greatly neglected in practice, and the actual religion consists but of vile idolatries. For example, the author of the work before us witnessed a magnificent festival at Kandy, in honour of Buddha's tooth, a relic supposed to have been saved from the funeral pile of the god. This relic, which is merely a piece of discoloured ivory, nearly two inches in length, and one inch in diameter at the base, has for twenty-four hundred years been an object of veneration; and though the enemies of the Buddhists repeatedly endeavoured to destroy it, it always came out of the danger in a triumphant and miraculous way. It was thrown into a pit of burning charcoal, and burst out unscathed, emitting rays that "illumined the universe." It was buried deep in the earth, and reappeared in the centre of a golden lotus. It was placed on an anvil to be destroyed, and sunk into the solid iron till the peril was over. Such are the sort of tales told of the tooth. It is now kept in a temple attached to the old palace of the Kandian kings, being laid on a silver altar, and enclosed in six cases of gold, ornamented with rubies and precious stones, besides other valuable appendages. "In the brilliant pageantry of the festival, the rich altar and resplendent ornaments of the relic, the great size and elegant decorations of the temporary buildings, the peculiar and picturesque dresses of the chiefs, the majestic elephants, and dense mass of people, threw an air of imposing grandeur over the spectacle. The Dalada (as they call the tooth) was exhibited, and the offerings continued for three successive days. The offerings consisted of things the most heterogeneous; gold chains and gold ornaments; gold, silver, and copper coins, of all denominations; cloths, priests' vestments, flowers, sugar, areka-nuts, betel-leaves." The plate illustrative of this festival, given by Major Forbes, presents us with a scene which perhaps excels in grandeur any thing ever imagined by poet or painter, unless it be some one of the conceptions of Martin.

The Dalada ranks highest among the visible objects of Cingalese worship; but very little inferior is the amount of veneration bestowed on a mountain of a remarkable character termed Adam's Peak, which is situated in the interior of the island, and was visited by our author. "The Mahommedans believe that the first man, Adam, whose height was equal to a tall palm-tree, after having been thrown down from Paradise, which was in the seventh heaven, alighted on this peak, and remained standing on one foot until years of penitence and suffering had expiated his offence." A mark, resembling a gigantic foot-print, has suggested this story, which is of great antiquity. The Buddhists, however, assert the foot-mark to be that of Buddha, while the Hindoos declare it to have been made by Siva in stepping over from Ceylon to the Continent. Hence the peak is an object of veneration to all parties, and pilgrims visit the spot in great numbers. The peak is 7420 feet high, and has a level space on the summit enclosed by a wall. In the centre of this space stands an isolated granite stone or rock nine feet high, and on this is the sacred

footstep. "This venerated memorial is five feet seven inches in length, two feet seven inches in breadth, and the very slight resemblance which it has to the shape of a foot is given by a *margin of plaster* coloured to resemble the rock. A temple built of wood surmounts the rock, and is retained in its exalted situation by strong iron chains." Of course there is a priest's house here; the thing would be incomplete without such an appendage. The peak is in itself a very extraordinary natural object, leaving altogether out of view the sacred foot-mark. The ascent is not peculiarly difficult, though pilgrims often choose a dangerous path, to increase their own merit. The rocks are covered with numerous inscriptions.

With the usual daring of the British soldier, Major Forbes frequently prosecuted the chase of wild elephants, which, as well as crocodiles, snakes, and leopards, are abundant in Ceylon. Seeing that single hunters there attack the wild elephant, it may well be believed that the scene which took place at the killing of the elephant at Exeter 'Change, some years ago, caused great laughter in Ceylon. The newspapers took out a plan of the scene, with the various objects regularly marked, such as A, the elephant, B, a party of the Guards; and, after all, a return was given of the ammunition expended in killing an elephant in *a cage*. We may well believe, we say, that all this would appear very ridiculous to a sportsman familiar with scenes like the following:—"In an extremely thick dark copse, matted with thorny creeping plants, two elephants had taken shelter. Creeping in on my breast for a few feet, I could distinguish the legs of a very large elephant, whose head was concealed by the foliage; but another and smaller one was sufficiently visible to allow of my taking a proper aim. Looking round, and seeing the coolies (native attendants) close to the edge of the brushwood, and being myself, as I imagined, ready to back out and face the expected charge of the large elephant, I fired at the other, and it fell dead. I then attempted to rise, but felt myself entangled by thorns. I had no time to repeat my efforts at escape; for I immediately felt the tangled mass of vegetation pressing forward upon me, while the big elephant rushed up almost close to where I lay, and there stood uttering that fearful, shrill, trumpet-like squeal with which these animals generally accompany their charge. I suppose it was unwilling to leave its fallen companion; for it did not follow the coolies, who ran off, but remained, trumpeting, and standing with its round shapeless legs within my reach, and its head almost over me. I had a rifle, carrying a ball of two ounces weight, in my hand; this I raised perpendicularly under the elephant's head, and with the butt-end resting on the ground, pulled the trigger. The shot took effect; the animal staggered back eight or ten paces towards the dead one, while, by violent exertions, I disentangled myself from my most uncomfortable position." The sportsman had no further trouble with the mortally wounded animal. His position, however, was one of awful risk, because it is impossible to tell whether an elephant's strength will be destroyed by one ball or twenty. Major Forbes relates several instances of fatal accidents from the fierceness of wounded elephants. In one case a gentleman was crushed to death in an instant by an elephant, and two of his friends, on attacking the same animal, would certainly have perished also, but for an accident. The creature charged, and came up to them, when they had barely time to run a few feet aside. Happily they both went to the left, and the elephant passed them, to their great surprise. It was afterwards discovered that one of their shots had destroyed the vision of the right eye. This accident saved their lives.

The extent to which the natives carry their daring in attacking wild elephants, is extraordinary. When a kraal, or enclosed space for catching these animals, is formed, and a herd has been driven into it, the hunters pass backwards and forwards with great boldness, effecting the operation of noosing. Partly protected by tame decoy elephants, they prick the feet of the wild ones, and on the legs being lifted, throw nooses dexterously round them. The noosed elephant starts off, but is speedily brought to its knees, the hunter having given the other end of the rope several turns round a tree. Major Forbes says he has seen men, stationed on trees, actually descend on the backs of wild elephants to dislodge them from the spot. When it is remembered that the animals are in an excited state, and that the hunter who comes within fair reach is sure either to be crushed to death by their trunks, or to be spiked by their tusks, the coolness of the native noosers appears very wonderful. On one occasion (says Major Forbes), "an unlucky hunter was seized by an elephant's trunk. Fortunately I regained my gun, and still more fortunately, considering the hurry in which I fired, the ball passed through the animal's head without injuring the man, who was released from a gripe so severe that it had already forced blood from his mouth and nostrils." Our author does not conceive the elephant to be nearly so sagacious as is commonly supposed, but allows that it occasionally exhibits peculiar cunning. "In 1829, one of the hunting elephants at Matalé, having shown symptoms of a capricious irritable temper, was in consequence secured to a tree near the stables; next day, as the keeper was standing barely within reach, the brute suddenly seized him at the moment *another* elephant was passing, and pressed the unfortunate man against this animal's front, until one of the thick blunt tusks came through the keeper's body." We also hear much about the attachment of these creatures to their keepers, but Major Forbes says that there are few of the old hunting elephants that have not killed people employed about them at one time or another.

In the course of an excursion, Major Forbes met with a pretended conjuror, who was placed in rather an awkward predicament. "He had, unluckily for himself, inspired his neighbours with a belief that he had the power of bringing rain by performing certain ceremonies, and they had spread his fame over the whole district. From this, and his knowledge of the appearance of the sky, and the various signs of coming showers or approaching heavy rains, he had long imposed on the people, and reaped considerable profit; until at last their eagerness of belief outrunning his powers of imposition, not only destroyed his occupation, but nearly cost him his life. It was urged by some one, and acquiesced in by all, that as there was no doubt of his ability to call down rain when necessary, it ought not to be left to his caprice when this talent should be exercised; and that, when required by a whole village, he should be obliged to furnish rain in sufficient quantities; that, if he did so, he was to be liberally rewarded; but, on the contrary, if he were contumacious, and refused to give the necessary supply, he should be tormented with thorns, or beat into compliance. Having suffered severe punishments on various occasions, he at last made up his mind no longer to be a responsible agent for the weather, and loudly and constantly denied having any authority in the matter. This, although deemed to be a false excuse, proved a sufficient protection to him during several seasons in which there was no deficiency of moisture; but, this season, the people, losing all patience from a long-continued drought, which was destroying their crops, dragged the recusant cloud-compeller to various villages, in which he suffered severely for his supposed neglect. Even the chief of the district had determined on having rain by force, if fair means proved insufficient, and had sent some of his followers to bring the conjuror to the village where water was most required: it was while on his way there that he was fortunate enough to see me, and, making his escape, threw himself on my protection. In the court-house the old man stated that he was in terror of his life, for at present there was every appearance of a continuance of the same dry weather that had already done so much mischief; and then gravely proceeded to prove to me by many oaths that it was no fault of his that no rain was forthcoming. I had some difficulty in protecting this old impostor, particularly as a few slight showers fell near his village, which was situated on one of the highest inhabited parts of the district; and I have no doubt the people thought, not that they had been the infatuated dupes of a rogue, but that I was imposed upon by a churlish wizard."

We learn from the work before us, as well as from other sources, that Ceylon is at present one of the most flourishing of our eastern possessions. Being a crown colony, it is exempted from the many petty exactions and obligations to which the company-governed continent of India is subject. In fact, it is a comparatively free country, and is rapidly improving both in its social and physical condition. Although greatly opposed by local prejudice, we are glad to know that juvenile education, accompanied by a knowledge of the English language, is making considerable progress—and what more is required in the first instance to render its people intelligent and happy!

Though we have been indebted for the matter of this article to the work of Major Forbes, yet our desire to make our account of Ceylon of a general character has prevented us from giving a sufficient specimen of the actual style of the writer, and we shall probably return, therefore, to these volumes on another occasion.

TRAINING OF CAPONS FOR NURSES TO POULTRY.

Capons may be trained to perform the office of nurses to young poultry, which they will execute in a better manner than even the mothers of the chicks. To those who attempt artificial incubation, this is a matter of some consequence, for no hen will readily nurse any chickens but those which she has hatched; whereas, the capon is an ever-ready nurse. In order to induce capons to take charge of chickens, Baptista Porta, an Italian writer, suggests that the skin of their breast should be irritated with nettles, so that they become anxious to allay the itchiness by sitting and rubbing upon the young chicks which are put to them. But this is a barbarous and far from certain mode of training. Others recommend to make the capon drunk with oat pickles steeped in brandy, believing that the capon in his intoxicated condition will fancy himself a hen, and so take charge of the chicks which crowd around him. This, however, is a fully more vicious plan of education—not that it causes the capon to acquire tippling habits, but because the animal, when tipsy, will most likely trample upon and kill the young family consigned to his care. The best mode of training seems to be that mentioned by Mr Rannie, in his volume on the Habits of Birds, in the Library of Entertaining Knowledge. He quotes the proceedings of Réaumur, the naturalist.

Réaumur, he observes, "having been convinced that such empirical practices were useless, put three capons under the care of the woman who had the charge of the poultry-yard at the Chateau de Vaujour; and as she proceeded on a regular and rational plan of tuition, put in force not for a single night or day, but continued for several days in succession, they came out of her school very well instructed in the space of ten or twelve days. Her method was, neither to pluck their feathers, to sting them with nettles, nor to make them drunk. She kept them alone for a day or two in pretty deep and rather narrow buckets, darkened by a covering of boards, taking them out two or three times a-day to feed. After making the capon in this manner wearied of solitude, she placed with him for companions two or three chickens, somewhat advanced in growth, and gave them all their food in common. If he ill used them, they were removed for a day or more, and then others were put to him. By such means, varied as circumstances indicate, the capon will contract a habit of living amicably with two or three chickens; and the number being increased by degrees, he will at last begin to take pride in his flock, so that it may be enlarged to any extent. Upon receiving his liberty in these circumstances, he will sit upon the chicks as a hen does, whenever they require to be protected from cold, and will lead them to places where they may find food, clucking like a hen to call them together when they straggle. He will likewise redouble his clucking when he finds such dainties as a piece of bread or an earthworm, which he will divide into several small portions to share it amongst them all, and will seem delighted to see them eat heartily of what he deprives himself of for their sake. After the few first days of training a capon, during which he may probably injure or kill two or three chickens, the task becomes easy; and when once he is taught, he will retain the habit to the end of his life, nor ever become tired of the task; for even when unemployed for several months during winter, he will take to it again in spring nearly as well as before."

OUR LADY TENDUDIA,

A LEGEND OF SPAIN.

WHOEVER passes at the present day through the bounds of the ancient kingdom of Toledo, will probably behold, if he looks well around him, a small and ruinous chapel, exhibiting the traces of great architectural beauty, and finely situated on the slope of a rising eminence. Within the walls of the chapel, the passer-by may also observe the vestiges of various old monuments, bearing the nearly defaced names of Penalba, Saenz, and Correa. He will be told, moreover, that the chapel was dedicated to Our Lady *Tendudia*, and he will still hear the peasant making orisons to the Virgin, under that particular designation. If he be an Englishman, and acquainted, even slightly, with the language of Spain, it is furthermore probable that the traveller will exclaim, "Our Lady *Stop-the-day!* [such being the meaning of the term Tendudia]; what an odd phrase to tack to the name of the Virgin!" And if he be so fortunate as to meet with some of the older peasants of the district, whose memories are stored with the traditions of the past, he will in all likelihood hear the following legend of a bygone age, in explanation of what has caused his surprise.

In the thirteenth century, the Moors occupied a great portion of the kingdom of Spain, and were engaged in continual contests with the Christian natives. "Oh, brave times!" says an old chronicler of these wars, "when every knight of the cross was brave as his sword, and true as its Toledan steel; and when to contend with the infidel was to win either the laurel of victory, or the palm of martyrdom! Oh, brave times! when every lady was beautiful as the day, and gave to her own true knight the encouragement of her smiles, and the aid of her prayers!" Of all the ladies to whom the chronicler might here allude, none could be more lovely than Donna Bibiana, daughter and only child of Don Raymon de Penalba, a gentleman of the kingdom of Toledo. Donna Bibiana, at the date of our story, was very young. She had large, soft, blue eyes, dark tresses, a sweet and smiling mouth, with an elegant figure, and feet so small that it was a miracle how even her slender figure moved about on them so firmly, though so lightly. Besides, she was extremely good and charitable to the poor, though she was far from being rich. As in duty bound, she detested the Moors very cordially, and in short had all the qualities of a pious and accomplished beauty of the day.

No, Donna Bibiana, or rather her father, was not overburdened with riches. Don Raymon, in fact, depended very much upon his sword for subsistence. Like a bold warrier, and a good subject of his sovereign, he had spent all his days in battling with the Moors, who were no very distant neighbours of his, and had often enriched himself with their spoils, only to be impoverished again by their reprisals. But though this sort of work left Don Raymon sometimes in poorish circumstances, such was never very long the case; for when his coffers were empty, he always called out his attendants, and led them once more against the infidels. At the close of the year 1240, Don Raymon set forth on one of these knightly expeditions. He was accompanied by ten of his men, and with them he crossed the Guadalquivir, directing his course towards the Moorish province of Jaën. When he reached the country of the enemy, he separated his warriers, sending five one way, and going himself in another direction with the remainder. He had scarcely done this, when suddenly, on rounding the corner of a hill, he found himself in front of half a dozen well-appointed Moors, who were apparently making their way towards the demesnes of the Christians with much the same intentions as his own. But what says the pro-

Digitized by Google

verb? "He that goes for wool may come back shorn;" and such was doomed to be the fate of the Moors on this occasion. Don Raymon was as discreet as bold. His first act, on seeing the Moors, was to put his bugle to his lips, and sound the signal of recal to the other division of his band. Then, turning to those with him, he bade them prepare for the attack, but at the same time, like a prudent man, he cried, "Mark the leader of the infidels; take him alive! His cloak of scarlet, with its gay gold fringes, and his diamonded scimitar, speak of riches. We must have a sweeping ransom from him."

While his men attacked without delay the rest of the Moors, Don Raymon, who never desired others to do what he could do for himself, rode sword in hand against the leader of the enemy. The latter defended himself bravely, but seeing his companions cut down one by one around him, he turned his bridle-rein, and betook himself to flight. The speed and freshness of his horse would have saved him, had not the other half of the Spanish party, on hearing the signal call, made a circuit of the hill, and so met and seized the Moor in his flight. With his captive, and the spoils of the rest of the enemy, the Christian chief made his way back, with all due haste, to his own territory.

Don Raymon de Penalba was not wrong in his supposition that the Moor was a man of wealth and distinction. Almoreb, as he was named, was a youth of the highest rank and greatest possessions in the kingdom of Jaën. His ransom was fixed by Penalba at 1500 maravedis of gold, and whilst they were waited for, the Moor was taken by his captor to the castle where Donna Bibiana usually resided. Almoreb saw the young lady, and immediately conceived a violent passion for her. Being a bigoted follower of the prophet, however, he at first only proposed to the Christian maiden to fly with him at the close of his imprisonment, without speaking of any intervening ceremony, such as is usually gone through on these occasions. Being very handsome, and having been greatly admired by the youthful beauties of Jaën, the gallant Moor was rather disappointed by the coldness with which Donna Bibiana listened to his advances. But his passion grew every day stronger, and at length he made distinct proposals for her hand to her father.

The intermarriage of Moors with Christians was by no means uncommon in those days, notwithstanding all the hostile struggles between the two races. Don Raymon was dazzled by the wealth and rank of the Moor, and being a kind father, whose anxiety to acquire fortune had a special reference to the future welfare of his daughter, the good knight thought marriage just as fair a way of attaining his aim as war. He therefore very earnestly recommended to Donna Bibiana the acceptance of Almoreb's proposals. But the young lady was of a different way of thinking, and gave a direct negative to the suit of the Moor. It has been mentioned that the young lady was very pious, and had a proportionate dislike of the infidels. But truth compels us to say that she was greatly guided in her opinions on this occasion by a distant relative of her own, a young and handsome cavalier, by name Don Martin Saenz, whose exhortations were peculiarly adverse to the wishes of the Moor. Don Martin had a castle and some few acres of land near the banks of the Azuer, and all the wishes of Donna Bibiana were bounded to the sovereignty of this castle, and of the heart of Don Martin. The latter had a particular aversion to the Moors, which had been augmented greatly since the capture of Almoreb. He would at once have provoked the Moor, it is probable, to single combat, had not the 1500 golden maravedis of Don Raymon been dependent upon the safe return of the captive to his friends. Therefore Don Martin contented himself with fortifying Bibiana by every possible means in her resolve to refuse the proffered suit.

Having received his ransom-money, and seeing that Don Raymon would not press his daughter against her wishes, Almoreb paid his captor, and withdrew to his own country, to meditate plans which he was not long of carrying into execution. But a few weeks had passed away, when Don Raymon received a letter, apparently signed by Don Pelayo Correa, Grand-Master of the Order of St James, desiring him to come instantly to Ciudad-Real, with Don Martin Saenz, and every man-at-arms whom he could command. The knight instantly obeyed the wishes of the grand-master; but scarcely had he left his castle, when Almoreb, at the head of a hundred Moors, appeared before the place. The gates being opened by a servant whom he had bribed during his captivity, the Moor entered, and carried off Bibiana, in spite of her tears and cries. She was placed in a litter, and without delay her captors took the road to Jaën.

Only one of the men left in the castle had escaped the scimitars of the Moors. He immediately directed his course to Ciudad-Real, and arrived just in time to find Penalba stupified with the tidings that Don Pelayo had sent no message for him. The servant cleared up the mystery. "Let us pursue the ruffians instantly," cried Don Martin Saenz, as he rushed out for his war-horse, on which he soon appeared, urging Penalba to follow him. Indeed, Don Raymon and Pelayo were scarcely less eager to commence the pursuit. Hastily gathering a band of nearly a hundred followers, they scoured across the country in the direction of Jaën, from which, fortunately, Ciudad-Real was not much farther away than Raymon's castle, though lying at a different point of the compass.

It was not long ere they passed the line of Raymon's castle, and came upon the traces of the Moors. The horses of the latter had performed a long journey from Jaën in the morning, and were far from being so fresh as those of the Christians. Don Martin pressed the latter to their full speed. He was ever in front, and ascended every spot of rising ground with the speed of lightning, scanning the horizon for the first glimpse of the foe. "On! on!" he cried, exultingly, at length; "I behold the enemies of our faith!" The intelligence inspired the pursuers with new zeal. They now saw in the distance a cloud of dust, and occasionally the gleam of bright weapons struck by the rays of the sun. Slowly but progressively they drew nearer to the flying Moors. But, alas! the sun was rapidly sinking towards the horizon. If the night set in before the encounter, the Moors would inevitably find a secure refuge in the mountains.

"Oh, our Lady!" cried the anxious Don Martin, "leave not a young Christian maiden in the hands of these infidels!"

As he spoke, he pressed on his companions to fresh speed. But the Arab coursers, with their outstretched necks, seemed to swallow the space before them, and although the distance between the parties was always diminishing, the chase was still continued. When at length the Christians came almost within spear length of the Moors, the sun nearly touched the horizon, rendering it a matter of great doubt if the encounter, when it did take place, would be effectual in the rescue of Bibiana.

"Oh, our Lady!" exclaimed Don Martin in tones of agonised entreaty, "*Nostra Segnora, Ten du dia! Ten du dia!*"

The legend tells that the entreaty was heard, and that the light of day did *not* pass away so early as usual. If you, having a strong faith in natural causes, were to suggest to the Spanish narrators of the tradition that the evening was probably nothing more than a remarkably fine one, you would only be pitied for your scepticism. However this may be, the Moors were forced to wheel and sustain the shock of their pursuers. For nearly an hour afterwards, a bitter conflict was kept up, which was terminated by Don Martin Saenz passing his knightly sword through the body of Almoreb, after a gallant single combat, viewed by the whole of both parties. The rest of the Moors immediately surrendered, and Donna Bibiana was not only recovered, but as the band of Almoreb was almost entirely composed of young men of rank who had joined him in his expedition, a great spoil was obtained through the capture and ultimate ransom of the Moorish prisoners.

Don Raymon, to prevent any such annoying adventures afterwards, immediately bestowed the hand of his daughter on Don Martin. Donna Bibiana and her husband were so grateful for the event just recorded, that, in commemoration thereof, they built a chapel, and distinguished it by the name of the chapel of "Our Lady *Tendudia*." From that time forth the pious people of the country around paid their orisons to *Nostra Segnora* under that name. Such is the legend attached to the ruins which the traveller may see, if he chooses, near the springs of the far-famed Guadalquivir. There were laid, in the lapse of time, the mortal remains of the fair Bibiana, with many a Saenz of her blood and race; and there, also, were laid many of the name of Correa and Penalba, to whose families the chapel remained ever a spot of strong and peculiar interest.

THE PROPHET OF 1770.

Let us suppose ourselves carried back sixty years in the stream of time, and to live again, the youthful subject of the young king George III. Let us likewise imagine that in those days the divine spirit of prophecy had come upon us, unveiling to our sight the events of the future. In seven years from this time the British empire shall be rent in twain (American war in 1776). In fifteen years men shall rise from the earth and fly through the air (invention of balloons, 1780). In twenty years the French monarchy, the oldest that ever was, and now so flourishing, shall come to an end. A virtuous prince (Louis XVI. 1793), not yet king, shall in twenty-three years lay down his life on the scaffold: his wife and sister shall share the same fate. In those same days, news shall travel with the speed of the wind, and what was done at mid-day shall be known at the farthest bounds of the kingdom ere the setting of the sun (the Telegraph, 1794). In twenty-six years a conqueror shall arise (Bonaparte), who shall water his horses in the Nile, the Jordan, the Tagus, and the Borysthenes. This conqueror shall restore the chair of St Peter, and throw down what he had restored (dethronement of Pius VII.) Finally, he whom the world could not contain, shall die a captive on a rocky island (St Helena), neither in Europe, Asia, Africa, nor America, but in the midst of the vast ocean: a few feet of earth his empire, a willow his monument. In those days metals shall be found which float on the water and burn under it (sodium and potassium, discovered by Sir Humphry Davy). Ships shall stem the stormiest ocean without sails or oars (steam-ships). Carriages shall run without horses, with the speed of the wind (locomotive engines). (The ordinary speed of the wind is 35 miles an hour; that of the engines on the Great Western Railway is 39.) Men shall be conveyed from India to the mighty Babylon in a month: from America in ten days: from one end of England to the other in eight hours. Bridges shall hang by a chain over the sea, while roads shall be made under it (the Menai Bridge and the Thames Tunnel). To those days of bloodshed shall succeed days of liberty. The Negro shall no longer be bought or sold. The slave shall be set free. The Greek shall be freed from the Turk; the Catholic from the Orangeman. The very beasts in those days shall have laws to protect them. Those days shall be days of great light. Men shall plough without horses (steam plough); they shall spin without hands (power-loom); they shall calculate by wheels (Babbage's machine); the sun shall engrave for them (the Daguerrotype); they shall write with the lightning (electric telegraph). One machine shall print in one hour many thousand books, each of which shall take a man many days to read; a man may buy a book for a penny; for a penny he may send it to the ends of the empire. They shall read the rocks instead of a book (geology), and decipher the history of beings which lived and died ere man existed. In the heavens new stars shall be discovered: some, sisters of the earth; some, brothers of the sun (the planets, five in number, discovered since the American war; and the double stars by Sir William Herschel); and of all the colours of the rainbow. In those days, likewise, they shall read the Pyramids (Young's and Champollion's discoveries). They shall find out the mouth of the Niger and the Magnetic Pole: the way to every thing shall have been discovered but the way to be happy.—*Phœnix (Edinburgh newspaper)*. Let us hope that in time the way to be happy shall also be discovered.

SIMPLE PLEASURES THE BEST.

When the inordinate hopes of youth, which provoke their own disappointment, have been sobered down by longer experience and more extended views—when the keen contentions and eager rivalries which employed our riper years have expired or been abandoned—when we have seen, year after year, the objects of our fiercest hostility and of our fondest affections lie down together in the hallowed peace of the grave—when ordinary pleasures and amusements begin to be insipid, and the gay derision which seasoned them to appear flat and importunate—when we reflect how often we have mourned and been comforted, what opposite opinions we have successively maintained and abandoned, to what inconsistent habits we have gradually been formed, and how frequently the objects of our pride have proved the sources of our shame, we are naturally led to recur to the days of our childhood, and to retrace the whole of our career, and that of our contemporaries, with feelings of far greater humility and indulgence than those by which it had been accompanied; to think all vain but affection and honour, the simplest and cheapest pleasures the truest and most precious, and generosity of sentiment the only mental superiority which ought either to be wished for or admitted.—*Jeffrey.*

BENEFICIAL INFLUENCE OF TEA.

The beneficial results of the introduction of tea and coffee have been strangely overlooked or underrated. It has been, however, well described as leading "to the most wonderful change that ever took place in the diet of modern civilised nations—a change highly important both in a moral and physical point of view. These beverages have the admirable advantage of affording stimulus without producing intoxication, or any of its evil consequences. Lovers of tea and coffee are, in fact, rarely drinkers; and hence the use of these beverages has benefited both manners and morals. Raynal observes, that the use of tea has contributed more to the sobriety of the Chinese than the severest laws, the most eloquent discourses, or the best treatises on morality." Tea is so little drunk in Germany, that it acts like medicine when taken by a native; and persons decline a cup of good bohea, with "No, I thank you; I am quite well at present."—*Hints for the Table.*

THE SPARROW AND THE CAGED BIRD.

FOUNDED ON AN ANECDOTE RELATED IN THE NATURALIST'S MAGAZINE.

I dote on every little bird
That twitters in the sun—
I love them all, from having heard
The simple tale of one!

In cage that 'neath the eaves was hung
When morn put forth her smiles,
A little yellow warbler sang
A song of distant isles!

One morn, when loud his melody,
There came on idle wing
A sparrow, and, from sympathy,
Thus seem'd to say or sing:—

"Fair captive! why this joyous lay,
When sad should be thy heart?
Art thinking of a happier day,
Forgetful what thou art?

Perchance, while high thy music floats,
Where ne'er thy wings may flee,
Thy spirit rises with thy notes,
For they, at least, are free!

Thy song goes forth among the trees,
And up to heaven's high dome,
And haply bears thee o'er the seas
To thy own island home!

Poor bird! could'st thou come forth with me,
I'd lead thee to the grove,
Where all that's known of slavery
Is servitude to love!

How sweet to join our airy chase,
Or cower within thy nest,
Yet only bound to that one place
Because thou loved'st it best!

Alas, alas! the wish is vain,
Thy prison-bars are strong;
But I will come to thee again,
Adieu, sweet bird of song!"

Away it flew, but day by day,
Return'd with gather'd food,
And through long months, the watchers say,
Went on this work of good.

I felt my holiest thoughts ascend,
Such heaven-taught love to trace,
And deem'd, perchance, this captive's friend,
The Howard of its race!

—*Scotsman.* J. H.

BAD TEMPER.

BAD temper, though a thing which every body in the world either manifests in himself, or suffers from in others, is not well understood. If its physiological causes and nature were generally known, its powerful action, as the blight of domestic happiness, might perhaps be in some degree mitigated.

The nursery gives us a strong hint of the real nature of bad temper. It is well known to all who have had any charge over infants, that, before their mental faculties have begun to act, if blessed by nature with a sound healthy constitution, fed properly, kept comfortable, and not subjected to external injury of any kind, they are generally quiet, or, to use the ordinary phrase of the occasion, good tempered. Health and good temper are, in fact, synonymous at that period of life. From this it may fairly be presumed, that, when children are peevish and fractious, they are not in a sound and comfortable state, but in the experience of uneasy sensations of some kind. Often, when an infant, usually good tempered, takes a sudden and apparently inexplicable fit of crying, it is found on examination that a pin has taken a wrong direction in its dress, or something troubles the stomach, or in some other way the child is undergoing suffering. The direct explanation of all crying and fretfulness in early childhood is, simply—*uneasy physical sensation*.

The sources or causes of fretfulness or bad temper in a child of the age indicated, are very few, because there are then only a few sensations. The child can feel a flesh wound or sore; or a derangement of the alimentary functions; or a want of those appliances which may be ranged under the term bodily comfort; but it can feel little else. Nervous irritability, though in the constitution, is not then developed, and scarcely can become the source of any unpleasant sensations. Even the senses are as yet dormant, and therefore cannot become a medium for the approach of disagreeable affections. We may here remark, that this limitation of the sources of uneasiness in an infant renders all prognostications of the future temper of a human being from cradle manifestations, extremely liable to error. One who is hereafter to be the victim of nervous irritability, and from other causes to be remarkable for bad temper, may be a healthy, well-kept infant, and therefore placid. Another, who, in adult life, is to be quite the reverse, may suffer in the first few months of his existence from ill health, mistreatment, or some accidental sore, and therefore appear very ill tempered. But we are anticipating.

As the faculties of a child increase, as sense after sense awakens, and one feeling after another becomes active in his nature, the sources of agreeable sensations may be said to be multiplied, for there is not one sense, or faculty, or feeling, which is not primarily designed to be a means of giving us pleasure. There is not, however, one of these senses or faculties which is not also liable to be *disagreeably affected*. This may be, either by its being disappointed of some object which it desires, or being acted upon by something the opposite to that which excites it agreeably. For example, the sense of taste may be disappointed of some expected or desired treat, or may be called upon to palate a nauseous drug; the desire of approbation may be thwarted in an effort to become dux of the class, or subjected to the severest mortification in a public whipping; a boy who hoards marbles and tops may be thwarted in a wish to collect a few more, or enraged by losing at play a large portion of what he previously possessed. In numberless various ways, the juvenile faculties may be offended, and in each case there will be an experience of angry feeling as the natural consequence. This feeling may not find vent, or it may be checked by an effort of reflection, or from some other cause; but the rise of such an emotion in the mind as a consequence of a sense or mental faculty disagreeably affected, is as certain as any thing in nature, and indeed takes place through the force of natural laws, as fixed in their operation as any of those disclosed to us in experimental philosophy.

In mature life, the senses are the same in number, but the mental faculties are rather more numerous. Some of the sensations, usually alone called physical, are dulled a little, or can be more easily controlled: a hurt or a cut does not make the full-grown man cry, as it made the child. Hector at twenty-four would not have beat a stool after falling over it, as Hector at four or five might have done. But the nervous system is now much more irritable than in early life. The mental faculties, both those which perceive and reason, and those which feel and prompt to action, are in their highest activity, though not in all persons alike powerful and active. Now, also, men are engaged in the struggles which attend social life in all its shapes, exposed to frequent disappointment and positive injury, and, therefore, more liable to have their faculties visited with disagreeable affections. There is now, to be sure, the greatest bodily vigour and the strongest exercise of will and reason; as also the greatest disposition to act upon a square with the ordinary ways of the world, and afford no ground for depreciatory remark. Yet, upon the whole, there is a greater chance of our appearing splenetic and irritable in manhood than in youth.

Men, it is obvious, are endowed by nature with very different degrees of general nervous irritability, some being alive to every casual impression, like harps so finely strung that the passing air brings forth their music; while others appear nearly torpid, and a great middle class are not remarkable in either way. What is called the *temperament of genius* seems to be nothing but extreme nervous irritability: it was exemplified in Tasso, Rousseau, and our own Burns and Byron. Great mental ability is often found apart from it; but is also often found so bound up with it, that those very men who, by their delightful effusions, charm their fellow-creatures unto all time, are themselves the most unhappy that live, being exposed to a thousand sources of suffering which others have no experience of. Nor is this extreme irritability only born with men. It often happens that persons originally sound, from the long and incessant action of certain circumstances, become in time liable to it. Smollett was an example. He was in early life a cheerful and agreeable man; but, entering upon a literary career, he tasked his brain so severely during a long course of years, and was exposed to so many exasperating annoyances of various kinds, that he at length became irritable to an extreme degree, though never altogether losing the benevolent and manly feelings which so largely inspired him in his better days. In both cases, great irritability may be considered as unsoundness; only, it is in the first case the result of circumstances which have taken place before birth, and in the second, of circumstances which have taken place in the course of life.

Then men are born with the senses and faculties in every conceivable variety of power and tendency to activity; and, as they go on in life, those various natural proportions are further varied by the different circumstances of individuals calling, in each, different faculties into vivid and habitual action, and leaving others in comparative dormancy. Every one of these faculties in every individual is liable to be disagreeably affected in the proportion of its natural or acquired activity; and what may be called the predominating or most conspicuously active faculty, is always the most liable to be so affected. Thus, there is no person who is not more apt to be irritated upon one subject or set of subjects, or by one act or set of actions, than by any other. For example, the avaricious man is most easily enraged by the fear of a loss of money; the proud man by an insult or a disgrace; the coward by a passing danger; the benevolent man by witnessing harsh and cruel actions. The liability to the irritation will in every case be modified by the acquired self-control of the individual, from whatever source that self-control has arisen; but the tendency or aptitude is invariable, and it will appear or not appear, operate or not operate, just as the natural irritability may permit, or the self-control suppress and allay.

All these phenomena depend upon a law of our constitution, by which, whenever a faculty is disagreeably affected, or a disagreeable sensation of any kind is experienced, one particular faculty of the mental organisation, which may be described as the Malevolent or Destructive sentiment, is called into less or more activity, according to the amount and nature of the offence, and the degree of strength and irritability which may characterise that particular faculty in the individual. The manifestations of this sentiment take many forms, from the extreme of physical violence down to the sly gibe and the peevish exclamation. At first sight, it appears a thing created only for evil; but there can be no reasonable doubt that it has been implanted in our nature for wise ends, and, under good regulation, would do nothing but good service. Such is the faculty which every disagreeable sensation arouses in our minds. The opposite feeling, Benevolence, is in like manner roused when any faculty is agreeably affected. Hence the gracious smile which in most cases follows praise, the good humour which the bon-vivant expresses over a well-furnished table, the kindness which a talkative man shows to a good listener, and so forth.

It is the frequent exhibition of this malevolent faculty which constitutes what is called *bad temper*. We repeat, wherever bad temper is found, it is nothing more or less than the *revenge of unpleasant sensations*. Some men are said to be of habitual bad temper; they are constantly angry, or snappish, or peevish. In many such cases, permanent uneasiness in the bodily feelings from bad health is the cause of the malady, for such it may be called. Often, again, it arises from the habitual dissatisfaction of some mental faculty; for example, self-esteem may be in a constant gangrene in consequence of some degrading or supposedly degrading circumstances in past or present life; the feeling of attachment may have been so wrung and tortured by a disappointment, that all loving may be declared, in the language of Amiens, "mere folly;" or the hopes of life in general may have been so blighted, that misanthropy is the consequence. To be habitually under the influence of envy and jealousy, is no uncommon condition: while such an influence lasts, there must be bad temper, for these are disagreeable affections of certain of the faculties. Of occasional bad temper, or bad temper only on particular points, most readers must be acquainted with examples. The mildest of men are found to have some little point in their constitution, liable to be so galled as to call forth angry feelings. An honest farmer whom we knew in early life, the most benignant and kindly of human beings, was never known to be angry except when he saw a fence broken down, or an idle herd-boy allowing the cattle to get amongst the corn. Another amiable man, who was said to be fond of the pleasures of the table, was considered by the working people under him as not safely approachable, especially for any thing like a favour, during the hollow and hungry hour before dinner. A third we have known, whose irritable point regarded nice arrangements in his

Digitized by Google

household. He had the misfortune to be so refined away into exquisiteness in all matters of punctuality, neatness, and economy, that the least error on the part of a servant set his usually courteous nature ajar for the remainder of the day. Sometimes, very odd and extraordinary matters are found to set mild men off their equipoise: in one case familiar to us, the frequent iteration of any thing monotonous in sound or silly in meaning has that effect. The liability of musicians to be put out of temper even by so small a matter as an ill-struck half note, is too trite to be worthy of remark. Occasional bad temper from such causes is easily explained: it obviously arises from the accidental over-refinement of some particular portion of the mental organisation. When any faculty becomes so far refined, it may be considered as in nearly the same condition as the whole nature of a man who inherits from nature extreme nervous irritability. Such a peculiarity is a kind of misfortune. It is best to have all the parts of one's nature only so far refined as to suit the average of the affections, agreeable and disagreeable, to which our situation exposes it. When any part goes beyond that, it is likely to become a source of great pain.

Considering bad temper in this philosophical point of view, we think some important advantages may be reasonably hoped for. Bad temper in one party is the constant cause why much bad temper is in others, for, being always disagreeable, its manifestations are almost sure to occasion irritation. Perhaps, this effect would not so often take place, if the well-constituted and placid were to look upon such manifestations as the result of either actual bodily pain, or at least disagreeably affected mental faculties, in those from whom they proceed. A feeling of pity would rather, in such a consideration, be due to those unfortunate individuals. Thus the mischief would stop with its originator, and even some efforts might be made to extinguish it there, where now it only gets additional exasperation. With regard to those whose bad temper is only excitable on particular points, it might be possible for their connections and dependents, by studying to give no cause of offence on those points, to prevent in a great measure explosions of anger and exhibitions of wrath, which are both disagreeable at the time to others, and afterwards almost certain to be deeply regretted by themselves.*

THE SUSPECTED SPY.

During the time that Murat held military rule at Madrid, he had occasion to send important dispatches to Junot, then at Lisbon; but it was a matter of great difficulty, as all the roads to Lisbon were in possession of the army of Castagnos—troops commanded by the most distinguished men of the Spanish revolution—and were also infested by a more dreaded enemy of the French, the guerillas.

Murat spoke of his embarrassment to Baron Strogonoff, the Russian ambassador at Madrid. Russia was at this time the friend more than the ally of France. After some consideration, Strogonoff said he thought it could be managed. He proposed that a Polish lancer, dressed in the Russian uniform, should be charged with dispatches from his court to Admiral Siniavin, who was then at the port of Lisbon, and that he might at the same time convey *verbal* dispatches from Murat. This scheme, he thought, was the more practicable, as the insurgent army of Castagnos was very desirous to obtain the neutrality of Russia, and therefore it was not likely they would give cause of umbrage by ill treating its messenger.

Murat was delighted with this ingenious plan, and immediately sent a request to Krasinski, the Polish commander, to be furnished with any young man of his corps whom he could recommend as brave, intelligent, and of good address. A young Pole, eighteen years of age, named Leckinski, volunteered for the dangerous service

Murat, who himself could calmly look death in the face, could not, however, in this instance, help pointing out to Leckinski the great peril he would be in should he be discovered. The young Pole smiled and said, "I thank your imperial highness for having honoured me above my comrades by selecting me for this duty, and I promise to render a good account of my mission." This bold and unaffected reply inspired the confidence of Murat, who forthwith gave him his instructions, when he departed for Lisbon dressed in the Russian uniform, and furnished with the dispatches for Admiral Siniavin.

The two first days passed without molestation; but about the afternoon of the third, Leckinski was surrounded and taken prisoner by a Spanish troop, who, having disarmed him, dragged him before the commanding officer, who happened to be Castagnos himself. Let the chief be who he might, however, Leckinski saw that he was inevitably lost if he was recognised as a partisan of the French. He therefore determined on the instant not to speak a word of French, and only to answer in Russian or German, both of which languages he could speak fluently.

The dreadful imprecations uttered on all sides in his way to Castagnos, told him his doom was already sealed. He had before his eyes the horrible fate of General René, who, a few weeks before this, in executing a mission similar to his own—endeavouring to join Junot—had been assassinated in the most barbarous way, and expired amidst the most frightful tortures. Death by torture creates terror even to the stoutest heart, and the blood round the heart of the young Pole froze within him for an instant.

"Who are you?" said Castagnos in French, which he spoke well, as he had been educated at Sorrize. Leckinski looked at him steadily, and made a sign of ignorance, and answered in German, "I don't understand you." Castagnos, who spoke German, did not perhaps wish to figure further in the matter, as he left one of his staff to continue the interrogatories.

The young Pole answered alternately in Russian and German, but never once let slip the least French intonation. He was, however, very uneasy, as he was in a very small room, surrounded by a crowd of men eager for his blood, who only waited for his being pronounced French to fall on him and massacre him.

These sanguinary feelings increased to a pitch beyond the control of even the general himself, in consequence of what appeared a most unlucky incident. An aide-de-camp of Castagnos, a man fanatically patriotic, as there were many in the Spanish war, and who, the moment Leckinski was taken, pronounced him to be a French spy, rushed into the chamber, dragging a peasant dressed in brown cloth, with a red feather in a high conical hat. The officer made way through the crowd, and, placing the man opposite Leckinski, said, "Look well at this man, and say whether he is really a Russian or a German. He is a spy; I will swear it with my life," said he, stamping furiously.

The peasant in the mean time attentively examined the features of the young Pole. The examination was not long; for, darting a malignant glance, with his eyes burning with rage, he clapped his hands, and cried out, "He is a Frenchman! he is a Frenchman!" and then told them that he had been only a few weeks ago at Madrid with some cut straw, which had been required from his village, as well as from every other in the district. "And I recognise this man," continued the peasant, "as he who received my portion of forage, and who gave me a receipt for it." This was true. Castagnos possibly saw the truth of it; but he was a noble and generous adversary, and it was not by massacres that he wished to build up the edifice of Spanish liberty, which would have been raised more beautifully, and more durably, had such men as himself, Romana, and Palafox, had the sole direction of affairs. He saw well that the young man was not a Russian, but he dreaded the horrible atrocities which would have been inflicted on him, should he be identified as a Frenchman. There was a doubt, and, above all, his appearance bespoke favour. He proposed, therefore, that he should be allowed to continue his journey, for Leckinski persisted that he was a Russian, and did not know a word of French. But at the first word the general uttered, there arose a hundred threatening voices, and even murmurs of the word traitor applied to himself. There seemed then no hope of mercy, for man becomes ferocious when he fears for himself. "You wish, then," said he, "to risk a rupture with Russia, whose neutrality we have solicited?" "No!" said his officers; "but let us prove this man."

Leckinski heard all, for he understood Spanish. He was led out of the chamber, and thrown into a place which might have passed for one of the most frightful dungeons of the Inquisition. At the moment the Spaniards had stopped him, he had not eaten any thing since the night before, and when the door of his prison closed on him, he had been eighteen hours without food. Add to this the fatigue he had undergone, the anguish and deep anxiety of his situation, and it will not be considered surprising that he fell nearly fainting on his wretched bed, which was placed in a corner of the room. The sun was not yet set. He had a glimpse of it through the cleft in the wall above his head, and the light, so brilliant in beautiful Estremadura, for a time cheered the heart of the poor prisoner.

This source of consolation, however, soon left him; the heavens became murky and cheerless; night closed around all; and poor Leckinski had full leisure to contemplate his dreadful position, which he judged as almost without the least hope.

He was undoubtedly a brave man. But to die at eighteen; it was very young. He battled with the visions which came before him and succeeded each other as in a phantasmagoria; at length youth and fatigue yielded, and he was shortly buried in the most profound sleep, the very image of death.

He had slept for about two hours, when the door of his prison was gently opened, and some one entered on tip-toe. A hand was placed before the lamp, and then some one leaned over the bed of the prisoner. The hand was taken suddenly from before the light, and he was touched slightly on his shoulder, and the sweet and gentle tones of a woman's voice said in French, "Do you wish to take supper?" Leckinski suddenly jumped up in his bed, with his eyes scarcely open, and said in German, "What do they want with me?"

"Let this man have something to eat," said Castagnos, on learning the result of this first proof, "and then let his horse be saddled, and allow him to pursue his journey. He is not a Frenchman. How could he be master of himself at such a time?—it is impossible."

But Castagnos was not alone. They gave Leckinski something to eat; but his horse was not saddled, and he remained in his prison till the morning. He was then taken to a place, and was shown the bodies of ten Frenchmen, who had been horribly massacred by the peasants of Truxilla. They kept him here all the day, threatening him with death, and that a horrible one. Constantly surrounded with snares, listened to with the most eager ears in order to catch a sound which might betray him, and watched by the most piercing eyes to discover a suspicious movement, he nevertheless maintained his equanimity. He had passed his word not to flinch, and he was resolved to keep it, and fulfil his commission. Not a single gesture or word of a suspicious nature escaped him. At length, after many hours of the most cruel trials, he was reconducted to his prison, and left to all the horrors of his uncertain fate.

"Gentlemen," said Castagnos, "I feel with you the great importance of preventing communication between the chiefs of the French army who are in Spain; but here, in the position in which we find this officer, we cannot treat him as a spy upon the simple assertion of one of our men. This man may be deceived by a resemblance, and then we shall become murderers—a part certainly ill becoming us to take, gentlemen."

Poor Leckinski felt a degree of pleasure in re-entering his dungeon, which was comparatively an agreeable change from what he had undergone for the last twelve hours. He had had nothing before his eyes but gibbets and hideous bloody carcasses, exhibited to him by men with the looks of demons, and the most ferocious countenances. His thoughts were, as it were, under the influence of a spell. He believed he saw on the cracked walls of his prison the fantastic shadows of the victims he had seen hanging from the trees on the road-side. Surrounded by these gloomy visions, exhausted nature again overcame him, and he fell into a deep sleep.

During this repose, his door was again softly opened, and his bed approached. The same gentle voice said in French, "Get up, and come; you are saved, and your horse is saddled."

The courageous Leckinski, however, always on his guard, said in German, "What do they want with me?"

Castagnos, on learning the result of this new proof, declared that the young Russian was a noble fellow. He had thought so, he said, all along. But this opinion could not sway the commission, *who wished to find him guilty*, and were outrageous at being thwarted in their wishes. All party spirit tends to weaken our just judgments of things; but the party spirit at this time in Spain raged with indescribable violence. These men, being baffled in accomplishing their blood-thirsty desire for a human sacrifice, were completely beside themselves. They were the same judges who had condemned General René *to be sawed in two!* who had placed Colonel Pavetti in an oven, and had horribly mutilated Franceschi.

Leckinski knew his danger, but he quailed not. After another dreadful night, four men, one of whom was the same who said he had seen him at Madrid, came to conduct him before a sort of tribunal, composed of many of the officers of the staff of General Castagnos. During the short interval on his way, they uttered the most terrible threats; but, true to his resolution, Leckinski appeared not to understand what they said. When he came before his judges, he appeared to understand what was going on, more from the preparations than from what was said around him. He asked where his interpreter was. The examination commenced. He was asked what his object was in travelling from Madrid to Lisbon. He answered by showing his dispatches from the Russian ambassador, and his passport. This would certainly have been sufficient, had he not unfortunately been recognised by the peasant. But the assertion of this man, who persisted in it with great firmness, afforded strong evidence of his real character to men so eagerly athirst for his blood. "Ask him," said the president of the commission, "if he loves the Spaniards, since he is not a Frenchman."

"Yes, undoubtedly," said Leckinski; "I love the Spanish nation, and I esteem it for its beautiful devotion. I wish our two nations were friends."

"Colonel," said the interpreter in French, "the prisoner says that he hates us, because we make war like banditti. He despises us, and he only regrets that it is not in his power to unite the whole nation into a single man, that he might end the war with one blow."

Whilst the interpreter spoke, every eye was on Leckinski, watching for the least movement of his countenance on hearing this unfaithful interpretation of his answer. But on coming to the tribunal he had made up his mind to every trial, and he therefore maintained the most astonishing self-possession.

"If they kill me," he thought to himself, "they will not only kill an innocent man, but one who has all the appearance of innocence, and they will therefore have all the odium of my death.

"Gentlemen," said Castagnos, who, contrary to his wishes, assisted at this last trial, but would take no part in it, "it appears to me that this young man cannot be suspected. The peasant must have been deceived. Let him, therefore, be set at liberty, and continue his route; and in rendering an account of what he has undergone at our hands, he will do well to take into consideration the continual danger of our position, which must excuse the rigour we are forced to employ."

* The philosophy of the above paper, such as it is, is based upon a theory which was first explained in a satisfactory manner by Mr Robert Cox, of Edinburgh, in a series of articles which appeared a few years ago in the Phrenological Journal, under the title of "Observations on the Mutual Influence of the Mental Faculties, and in particular on the modes and laws of the Activity of Destructiveness."

Digitized by Google

They then restored Leckinski his arms and dispatches, and gave him a safe passport; and he went away victorious over, it certainly may be said, as strong tests as were ever practised on a human being. He arrived at Lisbon, fulfilled his commission, and expressed a willingness to return to Madrid; but Junot would not allow the brave fellow to run such another risk.

POPULAR INFORMATION ON POLITICAL ECONOMY.

SECOND ARTICLE—PAPER MONEY.

In describing the origin of a metallic currency, allusion was made to the possibility of obligations or promises to pay being used as a medium of exchange, instead of metals, which bear their value in themselves. Although such documents might at first sight appear to be a very simple arrangement for creating a circulating medium, history shows them to be resorted to only in a far advanced and complicated state of society, and a little consideration will satisfy us that they cannot be brought separately into existence, but must be first ingrafted in a real or metallic currency. To illustrate the first employment of gold as a measure of value, a community of four individuals was supposed, each possessed of a separate commodity, of which the others wish to obtain a portion, giving an equivalent in return. If an attempt were made to create paper money among such a body before metal had been first employed, the nature of the obligations contained in the notes would of course be to give such and such a commodity. A could circulate an obligation to give a sheep to the bearer on demand, B to give a bushel of corn, and so on. Such documents would be almost totally useless for the purposes of money. The person to whom the obligation to give a sheep was offered, might not be in want of such a commodity, and might know no other person so anxious to obtain it that he would take the obligation off his hands. Moreover, there would be no general standard of value. It would be difficult to say what proportion a note for a sheep bore to one for a quarter of grain; and those who accepted of such documents, instead of receiving something of fixed value, would be purchasers of commodities, the value of which they might not be acquainted with. Instead of being paid, they would only be purchasers, or rather parties to a transaction for bartering goods.

When metal has once been brought into existence, however, as a circulating medium, every body knows its value, and an obligation to give a certain quantity of it is perfectly well understood. "I promise to give you on demand half an ounce of gold," is a sort of document which, if the person who received it has a perfect faith that the promise will be performed, would be just as valuable in his possession as the half ounce of gold itself. It might perhaps be more convenient to him to have the gold, as he might wish to employ a small portion of it in a petty purchase: but, on the other hand, there might be circumstances in which the obligation would be the more convenient commodity to possess; for example, he might fear being robbed, and would consider the note for various reasons more likely to be traced to the perpetrator than a piece of gold; or he might wish to pay a creditor at a distance, and the paper would be by far the more convenient substance to transmit.

In the circumstances in which the gold circulating medium was presumed to come into existence, it will be recollected that it occasioned a loss to the small community in whose proceedings the subject was illustrated. A coat was given by one of them in exchange for as much of the metal as would serve the purposes of the community. Thus, while they used the gold, they were paying for it as an expensive article of convenience. Should they find that obligations to pay, will serve their turn as well as the gold, they might then dispose of it to any others who wanted it, and recover the property they parted with, or its equivalent. It is thus pretty clear, that the use of paper money is a distinct saving, and that wherever it can be made to perform the services of the precious metals, the community who so employ it gain the difference between a dear and a cheap article. There is another convenience, moreover, in the use of paper money; whether an advantage or not, we shall not say, as we should then be entering on one of the many disputed points regarding the currency. The trading transactions of a large community may require a greater circulating medium than can conveniently be obtained in a metallic form. All the gold in the world would not supply Great Britain with a circulating medium equivalent to that at present in use. It may be said that, as the paper currency of the country professes to be a substitute for gold—is in reality a set of obligations to pay in gold—it must therefore be fallacious, as it not only promises that which the obligant has not to pay, but what in reality does not exist. It is not necessary, however, that there should be gold to represent all the paper money in existence; it is sufficient that there be capital, or property of some sort or other to do so. The calico-printer's bill for one thousand pounds is measured off by gold; but, in reality, it is the representative, not of so much gold, but of sundry bales of cotton cloth in his warerooms, the existence of which makes the holder of the bill know that it is worth a thousand pounds in gold. There are further conveniences derived by the commercial world from such documents, in aiding the trading relations of nations with each other, which will be noticed below.

Paper money, as already remarked, would be on all occasions an economical substitute for a metallic currency, if it could perform all the services of the precious metals; but there is one of the peculiarities of bullion which it is incapable of attaining; that is, absolute certainty that it is of the value it professes to be. The man who possesses an ounce of gold, knows that he has that which in every city, from London to Canton, will purchase him a certain quantity of the current commodities of the place. He, however, who has a bank-note, has that which is valuable only provided the person who becomes bound by it is able to fulfil his engagement, and which no one will take at its nominal value, except those who believe that he is so able. If no bodies of men, or individuals, ever issued pecuniary obligations beyond such as they were absolutely certain of being able to meet, paper money would be as secure as gold; such certainty, however, is not in human things. In the best system of paper money which ever has been or can be devised, there will be more or less of uncertainty. The question whether, under any of the present systems, or under others that might be substituted for them, the evils of uncertainty are compensated by the conveniences attending the practice, would bring us to the discussion of one of these debated points which we wish to avoid.

But to make a paper currency keep its value as compared with a gold one, it is not only necessary that the persons who issue the obligations should be able to meet them, but that there should not be a greater number of them brought into existence than the commercial wants of the community require. If there be notes to the extent of L.2000 in circulation among a community, whose business could be quite well transacted with L.1500, there will be a correspondent reduction in the value of the notes. If every issuer of paper were likely to be immediately called upon to pay in gold, and were prepared to meet the call, there would be little likelihood of one of these "over-issues," as they are technically called, occurring. But however great may be the facilities for enabling the holders of notes to get them paid, the public are not always on the alert to demand payment; and, indeed, if they were, paper money would not be of much service. The commercial world having once established the fact that the note-maker is trustworthy, it goes on using his documents without a thought whether he is issuing too many of them, until the over-issue is felt to act on commerce, and the paper gets depreciated. In 1814, during the time when the Bank of England was exempted from paying its notes in gold, the depreciation in the notes of the bank amounted to L.29, 4s. 1d. per cent.; in other words, a bank-note for L.1 was worth only a fraction more than 14s. The manner in which an attempt has been made to check the recurrence of any such mischief, is the following. Bank of England notes are every where a legal tender; in other words, every creditor is bound to take them as cash, in payment of his debt. At the bank, however, and at its branches, gold *must* be given for the notes when required.

Presuming that this, or any other check, could be the means of preventing an over-issue of paper from a government establishment, such as the Bank of England, there would still be, in a commercial country, a manufacture of paper money, which can neither be put down, nor subjected to a check. Every individual, indeed, whose bill or note of hand is taken by another, is an issuer of paper money, lending his drop to the ocean of the general supply. All operations in the science of political economy, as in most others, are best illustrated by particulars; and perhaps we may find the most intelligible illustration of the nature and effects of an over-issue, in looking to the conduct of a very few individuals. Let us suppose three or four young merchants beginning the world together without capital, and inclined to make a great effort to get on. They know that simple pieces of paper, with certain names written on them, will in certain circumstances pass for money, and they resolve to try if their own names will produce this magical effect. If they succeed, they know that in the end they will have to "retire their bills," or meet their engagements; but they are prepared to take their chance. John Thomson, then, we shall suppose, draws a bill on William Jones, which William Jones accepts. Thomson indorses it to Andrew Smith, who presents it at a bank to be discounted. A prudent bank will not discount such a document, if suspicious of its fictitious nature; an imprudent one will run the risk. Now, the state of circumstances which this document would lead one to believe in is, that Jones is owing money to Thomson, which he will pay him at the date mentioned in the bill, and that Thomson is in his turn indebted to Smith, and has given Jones's obligation to him in payment. The fact is, however, that none of the parties is owing the other any thing. Jones certainly becomes bound on the face of the document to pay so much money to Thomson, but he compensates himself by drawing a similar bill on Thomson, which *he* accepts; while Smith, who on their failure would be liable to the bank, likewise gets a bill in his favour as his share. Suppose each of the bills to be for L.100, here are L.300 created out of nothing—notes to pay that amount circulating as money, and nothing to meet them with. In short, just so much over-issue of paper money. When the time for paying these bills occurs, the parties probably draw similar ones for a larger amount, and so manage to pay them up in the mean time, obtaining a little more money, incurring heavy expenses, and becoming liable in the end to make good increased engagements. It may happen that the individuals in question shall prosper rapidly, and be able in the end to meet their obligations; and if it were not for such a chance, nobody whatever would take their bills as cash. Such documents are known by the names "accommodation bills," "wind-bills," and "kites."

Let us compare this sort of transaction with a *bona fide* bill, a "bill for value," as it is called, given in the usual course of mercantile transactions. A retailer in a steady trade receives goods from a wholesale merchant. The former will not be able to pay for them till part is sold; the wholesale merchant wants his money for some profitable investment. The retailer gives the merchant his bill "for value." The banker to whom it is presented knows that it is the representative of property, the produce of a real transaction, and that the security for its being paid is good. To be sure, there is a risk of the bill not being paid. All human things are uncertain; the shopkeeper's premises may be burned down or broken into, and so it *may* happen that this bill too is an over-issue. But it is not like those mentioned above, an over-issue in the very nature of the transaction, depending on chances for being converted into a genuine security. One of the most calamitous instances of private over-issues that ever occurred, was the case of the Ayr Bank in Scotland. Instead of being ready to take advantage of the legitimate demands for accommodation which arose out of real business transactions, it endeavoured to push forward such transactions by giving the accommodation in the first place. If success had attended the various schemes of those to whom it made advances, all would have been well; but the usual proportion of them failed, and the concern gave way, burying many a noble fortune in its ruins.

We must not omit some account of one of the most important uses of paper money, and that for which it was in reality first invented—the settlement of pecuniary transactions between individuals at a distance from each other, without the actual transmission of bullion. If an individual, A, in London, have a debtor B and a creditor C, both in Paris, instead of sending money to C, and getting money sent to him by B, he may give C an order on B to pay the debt over at once to him. This is a bill of exchange in its simplest form. Suppose, however, that A has a creditor in Paris, but no debtor, while his neighbour E has a debtor, but no creditor: A may pay the money to E which the French debtor owes him, and obtain from him an order on his debtor to pay A's French creditor. This order he will be said to purchase. It will be an accommodation to him, or an accommodation to the other party, according to circumstances. In the complicated arrangements of modern commerce, the individual debtors and creditors are lost sight of. If a person has a sum to transmit to another country by such an order, the rate at which he will obtain it will depend on the pecuniary relations of the two places taken in the main. If there is more money payable at the moment by people in London to people in Paris, than there is payable by those in Paris to those in London, there will be a demand for orders on Paris, and a premium will be payable for the accommodation by those who want them. In this case the exchange will be said to be against London. In Paris, on the other hand, there will be more people ready to give such drafts than there are in want of them, and those who dispose of them must do so at a discount. The rate of exchange is from this circumstance said to be in favour of Paris. The premium in the one case, and the discount in the other, will be measured by the balance due by London to Paris over what is due by Paris to London, and the principal sum to be met by the rate of exchange will be the expense of transmitting that balance in specie, unless the accounts can be adjusted by bringing transactions with some other community into the circle.

HINTS ON GIVING DINNERS—FOR HOUSEKEEPING LADIES.

It is the mode of dinner that I wish to recommend, and not any particular dishes or wines. Common soup made at home, fish of little cost, any joint, the cheapest vegetables, some happy and inexpensive introduction, like the crab, and a pudding, with sherry and port, provided every thing is good in quality, and the dishes are well dressed, and served hot and in succession, with their adjuncts, will insure a quantity of enjoyment which no one need be afraid to offer, and so it will be with any combination in the same style; but then it is absolutely necessary not to overdo the thing on the one hand, and, on the other, to direct the attention entirely in the right course; to think nothing of display or fashion, but only of realities, and to dispose every thing for comfort and ease. What is there in state and show to compensate for the loss of enjoyment? They are the resources by which dullness seeks to distinguish itself, and it is pity that those who are capable of better things should submit to such trammels. In proportion as the set-out is brilliant, I have observed the company is generally dull, and every ornament seems to me an impediment in the way of good fellowship. These snug little parties, I must confess, have very much the air of being confined to bachelor ones, but I think them equally applicable to a mixture of the sexes. Ladies are very apt

Digitized by Google

to suppose that men enjoy themselves the most when they are not present. They are in a great measure right, but for a wrong reason. It is not that men prefer their own to a mixture of female society, but that females delight in a number of observances, and in forms, upon some of which I have already touched, and upon a certain display and undeviating order, which conspire to destroy that enjoyment which they seem to think they are debarred from. The fault is their own. If they will study my doctrines, and fall a little into the herring-and-hashed-mutton system, they will soon find a difference in their favour. In their management of dinners, let them only think of what contributes to real enjoyment. Such a system will afford them plenty of scope for the display of their taste in realities, instead of in vanities which have no charms for men in the article of conviviality. If they wish to witness any thing like the enjoyment I have described to have taken place at my dinner at the Temple, they must adopt something of the same course to insure it. Side-dishes, centre-pieces filled with flowers, and such encumbrances and impediments, are fatal to it. They may make their election, but they cannot have both. I rather believe they think their system necessary to keep up a proper degree of respect to themselves, and that without it men would become too careless and uncivilised; but this I apprehend to be a mistake. There may be well-regulated ease without running into disorder and brutality; and whatever facilitates the social intercourse between the sexes, will of course increase refinement on the part of the men. I think it would be a vast improvement in society if the practice of familiar dining were introduced—parties not exceeding eight, without the trouble of dressing beyond being neat and clean, with simple repasts, costly or otherwise, according to the means or inclinations of the givers, and calculated to please the palate, and to promote sociability and health.—*From the Original, by Thomas Walker, Esq.*

INTELLECTUALITY OF ANIMALS.

The May number of the Dublin University Magazine contains an interesting paper on what is termed the "Intellectuality of Domestic Animals." It forms the substance of a lecture delivered before the Zoological Society of the Irish capital, by a gentleman distinguished for his talents and accomplishments, and whose name, though given only in initials in the Magazine, ought in mere justice to be mentioned at full length, even if the fact of the lecture having been a public one did not render any secondary concealment unavailing. The article is one which will reflect additional credit on the author—the Rev. Cæsar Otway. We would willingly cite the whole of the lecture, but our space will only admit of extracts. The author thus opens his views of the subject under consideration:—"I am about to say what I am able on the habits and intellectuality of animals. I allude to two qualities—habits, or, in other words, instinct—intellectuality, or, in other words, understanding. I confine myself, in order to keep within bounds, to domestic animals. We all must allow that animals have instincts that distinguish one species from another—those of a sheep, for instance, as differing from those of a dog. Well, supposing I identify habits with instinct, should I not define what instinct is? Perhaps I am not able—I stand not here as a philosopher—but this I know, that one who has given the subject more consideration than I can, has said that no one can define properly what instinct is, until he has spent some time in the head of a brute, *without being a brute himself*. But the same author ventures to give what may *stand for a definition*, and it is this—'those faculties that God has implanted in animals, whereby, independent of instruction, observation, or experience, and without knowing the end in view, they are impelled to the performance of certain actions conducive to their own well-being, and the preservation of their species.' But will those at all acquainted with animals be content with ascribing to them *such a limited quality as this*? Do not we find an adaptation of plans to circumstances, and an exercise of individual judgment, reflection, induction, and memory? I *must* insist, then, that the creature has personal and independent mental powers; and if you will not call it reason, confess that it is akin to it, and call it intellectuality."

The sequel of the paper is devoted to the proof of these opinions by argument and anecdote, and from the whole is extracted an admirable moral. "I told (says the reverend gentleman) that there are intellectual qualities belonging to animals, which call for our observation, demand our aid in their developement, and which, in proportion as observed, and respected, and developed, will be conducive to the animal's happiness and to man's use and profit." Humanity and attention to our domestic animals are the practical lessons which the writer inculcates. From his numerous stories relative to domestic animals, our treatment of them, and the intellectuality they evince, we select the following, assured that they will be productive of equal entertainment and instruction to our readers:—"Would you believe it, that in Ireland, though there was an express act of parliament passed against it three hundred years ago, the practice of harrowing by horses drawing from the tail, is still resorted to; the following is part of a letter I received yesterday:—

'The good old custom of harrowing by the tail, is still followed in Erris. In justice to those who continue the practice, it is said that it is not cruel, for the horses submit to it quietly. Indeed, some people here assert that it is the most humane way of doing the work; in proof of which, I shall sketch the following anecdote. I was on my way to dine with a worthy old *gentleman*, who resided here on my first arrival, nineteen years ago; and observing, as I went through the farm, this practice, it was natural for a foreigner to express strongly his feelings on the barbarity of the thing. "I beg your pardon," said my host; "you are quite mistaken; for I assert, and feel assured I will induce you to agree with me in opinion, that it is the most humane way of working the beast; and for this reason, that he harrows with more ease to himself." "Impossible," said I. "I will prove it to a sailor as you are, with ease," replied the old gentleman. "Pray, when you anchor your ships, why do you give them a long scope of cable when it blows hard." "Because," said I, "the hold the anchor has of the ground is in an inverse ratio to the sine of the angle the cable makes with the ground." "Oh!" says my old friend, "being neither an orangeman nor ribbonman, I know nothing about your *signs*, though I guess at what you mean. Now, if you give a long scope of cable to increase the resistance, don't it stand to reason that a short scope must have a contrary effect; and, therefore, must not harrowing by the tail be easier to the animal than from the collar, inasmuch as in the latter case the harrow rope is shortened by the whole length of the horse." My host, chuckling with delight, seemed to consider this argument a floorer. And my "But, dear sir, there is a vast difference between securing a cable to the bolt, and making it fast to the rudder," neither diminished his glee nor induced him to change his opinion. He continued this practice to his dying day; and up to last year it was, and now (1840) it will be practised. It is hard to break a custom attended with no expense. "Of what use is a tail," says the Erris man, "if not to save all sorts of harness?"'

But it is not only horses that are ill-treated. There is that poor little inferior beast, the ass, that appears to be consigned, by general consent, to all the wrongs that the lowest of the human race may inflict; the urchin's sport, the tinker's drudge.

I assert, that were you to make yourselves acquainted with asses, you would find them clever enough. I once purchased an ass for the amusement of my children. I did not allow him to be cudgelled, and he got something better to graze on than thistles. Why, I found him more knave than fool; his very cleverness was my plague. My ass, like the king's fool, proved the ablest animal about the place; and, like others having more wit than good manners, he was for ever not only going, but leading other cattle into mischief. There was not a gate about the place but he would open—there was not a fence but he would climb. Too often he awoke me of a summer's morning, braying for sheer wantonness, in the middle of my field of wheat. I was obliged to part with him and get a pony, merely because he was too cunning to be kept.

I could relate some curious instances of their memory for persons and places, and their attachment to individuals—I shall allude but to one, the well-known story of Captain Dundas's ass, that he had shipped from Gibraltar to Malta; and when a storm came on, when far on their voyage, and the vessel was in such danger that all the live stock was thrown overboard, the ass swam to shore at Cape de Gat, and in an incredibly short space of time made his way over the rivers and mountains of the Ronda, for two hundred miles, until he found himself standing at the door of his master's stable in Gibraltar.

There is another domestic animal, that I think has not got fair play from man, and that is a goose. Wild or tame, I hold that geese are not to be sneered at. The wild are the most wary of all that take wing—see how aloft the flock soars, observe with what beautiful mathematical precision the order of flight is kept—listen to the voice of direction or of warning that the sentinel keeping in advance every now and then gives out—look how each bird in turn takes the leadership, and how the one relieved assumes his regular position in the rear; let no one venture to tell me that there is not considerable intelligence in these animals; every one knows how watchful geese are even in their domesticated state; every schoolboy has learned how they saved the Roman capitol. At the flour mills of Tubberakeena, near Clonmel, while in the possession of the late Mr Newbold, there was a goose, which by some accident was left solitary, without mate or offspring, gander or goslings. Now, it happened, as is common, that the miller's wife had set a number of duck-eggs under a hen, which in due time were incubated, and of course the ducklings, as soon as they came forth, ran with natural instinct to the water, and the hen was in a sad pucker; her maternity urging her to follow the brood, and her selfishness disposing her to keep on dry land. In the mean while, up sailed the goose, and with a noisy gabble which certainly (being interpreted) meant, leave them to *my* care, she swam up and down with the ducklings, and when they were tired with their aquatic excursion, she consigned them to the care of the hen. The next morning, down came again the ducklings to the pond, and there was the goose waiting for them, and there stood the hen in her great flustration. On this occasion we are not at all sure that the goose *invited* the hen, observing her maternal trouble, but it *is* a fact, that she being near the shore, the hen jumped on her back, and there sat, the ducklings swimming, and the goose and hen after them up and down the pond. And this was not a solitary event; day after day the hen was seen on board the goose, attending the ducklings up and down, in perfect contentedness and good humour—numbers of people coming to witness the circumstance, which continued until the ducklings, coming to days of discretion, required no longer the joint guardianship of the goose and hen.

While this paper was passing through the press, a lady supplied me with the following anecdote of a goose, which she assures me can be depended on. I have every confidence in her credibility:—A goose, not a gander, in the farm-yard of a gentleman, was observed to take a particular liking to her owner. This attachment was so uncommon, and so marked, that all about the house and in the neighbourhood took notice of it; and, consequently, the people, with the propensity they have to give nicknames, and with the sinister motive, perhaps, of expressing their sense of the weak understanding of the man, called him Goosey. Alas! for his admirer—the goose's true love did not yet run smooth. For her master, hearing of the ridicule cast upon him, to abate her fondness, insisted on her being locked up in the poultry yard. Well, shortly after, he goes to the adjoining town to attend petty sessions, and in the middle of his business what does he feel but something wonderfully warm and soft rubbing against his leg, and on looking down he saw *his* goose, with neck protruded, while quivering her wings in the fullness of enjoyment, looking up to him with *unutterable* fondness! This was too much for his patience or the bystanders' good manners, for while it set them wild with laughter, it urged him to do a deed he should ever be ashamed of; for, twisting his thong-whip about the goose's neck, he swung her round and round until he supposed her dead, and then he cast her on the adjoining dunghill. Not very long after, Mr Goosey was seized with a severe illness, which brought him to the verge of the grave; and one day, when slowly recovering, and allowed to recline in the window, the first thing he saw was *his* goose, sitting on the grass, and looking with intense anxiety at him. The effect on him was most alarming. 'What!' says he, 'is this troublesome bird come back to life, and am I, for my sins, to be haunted in this way?' 'Oh! father,' says his daughter, 'don't speak so hardly of the poor bird. Ever since your illness it has sat there opposite your window—it scarcely takes any food.' Passion, prejudice, the fear of ridicule, all gave way before a sense of gratitude for this unalterable attachment. The poor bird was immediately taken notice of, and treated, from henceforth, with great kindness; and, for all I know, Goose and Goosey are still bound in as close ties as man and bird can be.

I shall trouble you with but one story about cows; it came within my knowledge this summer; the circumstance occurred to one of my own. I am in the habit every year of buying two or three Kerrys: they are the kindest little creatures in the world; they pay very well; and though wild at first, they become under proper treatment exceedingly gentle and familiar; when I buy them, I always choose from the head and horn; I pick out those I consider to have good countenances. Last year I was very lucky in the three I bought; they became in a short time great pets. I generally go out in the morning before breakfast, and they always meet me at the gate of the pasture, expecting to have their heads scratched, and be spoken to; one in particular, a quaint crumpled-horned little lassie, used to put her snout into my pocket like a dog, to look for bread and potatoes, which I generally brought with me; her breath was so sweet, and her large eyes so placid, that I was almost tempted to be of the humour of the man who loved to kiss his cow. Well, there was a swing-swong in this field, and my Kerry lass, who was inordinately curious, seeing my young ladies swinging, thought (I suppose) she might take a swing herself; be this as it may, one day, about noon, a constant and loud lowing of cows was heard at the gate nearest the house, and my brother, who was within, hearing the unusual and continued noise, went out to see what was the matter; as soon as he came to the gate, he saw two of the Kerry cows very uneasy, but not the third; so he proceeded into the grounds; and as he went, the cows followed him still lowing, until he arrived at the farthest end of the land, when he saw my pet, the third Kerry, entangled in the rope of the swing, and caught by her head and horns, where she must have been soon strangled if not relieved; the moment my brother extricated her, the lowing of the others ceased. I could not learn that my Kerry fair one ever after attempted the humours of a swing-swong.

Of dogs I need not say much. Large books are to be got, descriptive of their fidelity, intelligence, and usefulness; and each of you no doubt has some fact that has come under your own knowledge, and which convinces you, that dogs have almost reasoning powers. Many of you no doubt have read of the Newfoundland

Digitized by Google

dog in Cork, who, when vexed, barked at, and bitten at by a cur, took it up in his mouth, went quietly to the quay, and dropped it into the river; and when after a time he saw it carried down by a strong tide, and unable to swim to shore, he plunged in, took the culprit by the neck, brought it to land, and, giving it a shake, departed; the shake being as much as a *hint* to go and sin no more. Here was justice tempered with mercy—here was an acquaintance with the nature and uses of secondary punishments, that would have done credit to a political economist. But I cannot leave the subject of dogs without recounting what I heard within these few days, respecting a dog I have the pleasure of knowing; and I am assured that the *facts* can be attested by fifty persons or more; in truth, by the inhabitants of a whole village.

The rector of a parish in the county of Sligo, at whose house I spent some days last September, has an English spaniel, now rather advanced in years. He has been of great value as a sporting-dog; and, besides, being remarkable for general sagacity, has acted as a playfellow, a guide, and a guardian, to seven sons. Now, the eldest had just gone out into life with every promise of being a credit to his parents, and a blessing to them and others. He had been ordained and appointed to a curacy, where he was loved, honoured, and followed. But in the midst of his sacred labours, and in attendance on a sick-bed, he got a fever; during the progress of the disease, his parents were apprised of his illness, but not so as to communicate much apprehension; but, still being at a distance of one hundred and forty miles, they were anxiously looking out for another letter. In this interval the spaniel was observed to have left the hall door, where he usually basked during the day, and betake himself to a high ditch that overlooked the road towards Dublin. There he continued to howl at intervals, and though sometimes coaxed away, and sometimes driven by his master with blows, he returned, and for two days continued; when, without any apparent reason, he left the spot, and came back to his usual haunts. In the regular course of post, a letter brought the sad tidings, that on the day on which the dog ceased howling, the young man had breathed his last.

Of all the sights under the sun, perhaps the most touchingly grievous is the spectacle of parents mourning over the death of children that have arrived at maturity, and who just give the goodly promise of being the sure stay of their declining years. The parents I now allude to, have been sorely tried in this way; for, the year following, the next son, a youth of twenty, a fine manly fellow, with every quality of head and heart that a fond father could desire; *he*, also, was seized with fever. It is not for me to detail the alternations of hope and fear that possessed the minds of this much-tried family. But what I must relate is, that the spaniel was found to have returned to his former station on the ditch, and there was uttering his melancholy howl. I can never forget the deep feeling with which the father told me how an aged female follower of the family, who had nursed the boy, and taught him to lisp Irish on her lap, came up and told him in *an agony of tears* that it was all of no use—he might as well send away the doctor—for that yonder was the dog, and there he was howling, and it was all over with Master Edward, for God had called him away. And so it was. The youth died; and from *that moment* the dog ceased to howl; neither was he any more seen resorting to the place he had so ominously occupied. I have heard of many similar instances of dogs being acquainted with the coming death of those they love, but not with one so well attested as this. I tell what I believe to be true, and without drawing any superstitious or supernatural inferences from it. I can only conclude, that there may be communicated to the acute senses of dogs, and other animals (as, for instance, ravens and magpies), evidences of approaching dissolution, which to us are altogether unexplainable; and that there may be in heaven and earth things not dreamed of in our philosophy.

In corroboration of the above statement, I give the following extract of a letter I received from a lady with whom I had subsequently conversed, and who, I am assured, would not knowingly assert what she thought was untrue:—

'I hope you will accept the following statement, in return for the gratification I received from your lecture on the sagacity of animals:—

When I was a child on my dear mother's knee, she often amused me with stories of the affection and sagacity of "Dick," her father's favourite dog. One incident remained deeply impressed on my mind. My grandfather, Mr H——m, of the county of Cavan, came to Dublin on business, and shortly after Dick repaired to an old limekiln, which he refused to leave, and then set up a dismal and incessant howl. The next post brought the news that Mr H——m was seized with gout in his stomach, and before his son could reach Dublin, he was no more. The dog ceased to howl exactly at the period of his master's death; and having refused the food brought to him, was found dead before the funeral arrived at the family burial-place.' * *

It is now time for me to have done; done, I say, for I have not finished; for though I have satisfactorily proved, at least to myself, that inferior animals have intellectuality, I have not shown how the mere intimate observation and study of their capabilities can make them more happy in themselves, or more useful to us. But I think that it may be *inferred*, without any extended process of reasoning, that the more we study the character of animals, the more we shall respect and cherish them."

This lecture, we repeat, is one that does honour alike to the head and heart of the amiable and talented author.

WEATHER-WISDOM.

SOME people pretend to be wonderfully skilled in foretelling the weather; but we do not believe that much extraordinary knowledge on this subject exists. By observing the motion and appearance of the clouds, and a few other simple phenomena, it may be possible to foretell, with considerable certainty, whether we are to have a dry or a wet day to-morrow; but nothing more. We consider all predictions from changes of the moon, as quite fanciful, for they are as often wrong as right. Yet some people put great faith in this mode of weather-prophesying. "We are to have fine weather all this week—the moon changed to-day at a quarter to twelve o'clock." Such is the kind of dogma to which they attach their faith in this singularly delicate and difficult matter.

Latterly, we have had a class of professional weather-prophets—men who drive a trade in foretelling weather by the year, and you have only to buy their book to know all about it. While Mr Murphy acts as weather-counsel for England, we are here in Scotland equally well assisted by Mr Mackenzie. Both have their book; though, to do our countryman justice, he has never, we believe, made a fortune by it, and, though apparently a deluded, is an honest and well-meaning man.

Mackenzie long preceded Murphy in his "discovery of the true principles on which the weather is regulated." We daresay it is twenty years since he began to make himself heard, and he is yet engaged in instructing the world's obdurate ignorance. Every year, about the month of October, he issues a kind of programme of the weather for the ensuing twelve months, beginning with the 1st of November, or what he calls the weather year; and this being copied with great veneration by the provincial newspapers, the farmers have themselves to blame if they unawares see the rain fall or the wind blow upon their crops and herds. Mr Mackenzie says in his announcement, that as long ago as 1802, he began to keep registers of the weather, and by comparing these in subsequent years, he discovered that the winds had cycles, or blew in one manner in every series of years; wherefore, as he wishes us to understand, there is a course of weather for a certain number of years, and then the routine begins again, and is the same as before. This, it will be observed, is the revival of an ancient doctrine, and, as has been again and again proved, has no foundation in nature. Weather depends on so many contingent circumstances in this variable climate, that probably from the creation to the present time there have not been two years exactly alike—nay, not two days in different years alike. Be this as it may, Mr Mackenzie has got the crotchet in his head that he has found the trick of the weather, and labours hard to prove himself a true prophet. We shall now put his predictions to the test. In his last annual announcement he gives the following as the weather for April of the present year:—

"*April.*—About average windy; in cloudiness nothing remarkable; frosty; yet days temperate and mild promise a full average—and why? because the days of rain promise considerably above average; quantity of rain much above average. Character—slightly windy, slightly cloudy, and very wet; this month will damp the agriculturist."

Now, we ask if ever an event more completely falsified a prediction. Instead of being *very wet*, it is notorious that all over the country April was a miracle of drought and sunshine—the driest and most beautiful sunny weather that has been experienced during spring within the memory of man. We wish it to be understood that we should consider the exposure of this piece of delusion as quite beneath notice, unless for the purpose of warning simple people against putting any faith in such gross absurdities. There is always a tolerably large section of the public who will believe any thing, provided it be asserted with a sufficient degree of earnestness and pretension, and particularly if it be brought repeatedly before them in print. It should be made known to these credulous though well-meaning persons, that the weather in Great Britain is dependent on atmospheric phenomena occurring at thousands of miles' distance on the Atlantic Ocean, in high northern latitudes, or in remote parts of continental Europe, Asia, and Africa; and, therefore, to foretell with certainty what will be the state of our weather on any given day or month, we should, for example, first require to know what is to be the state of the weather in the Gulf of Mexico, Behring's Straits, or the deserts of Tartary or Africa. The thing is utterly impossible. Beyond a shrewd guess, from circumstances immediately under observation, no one can go in their predictions of the weather for the next four-and-twenty hours.

BIOGRAPHIC SKETCHES.

RICHARD PORSON.

THIS eminent scholar was born, on the 25th of December 1759, at East Ruston in Norfolk, where his father, Huggin Porson, was parish-clerk. Huggin, though placed in a humble sphere of life, and without the advantages of a regular education, was well qualified to foster and draw out the talents of his son. It is related of him that he was accustomed, from the earliest period of the existence of his children, who were three sons and a daughter, to exert himself to fix their attention, so as to make their minds susceptible of knowledge. Richard, the eldest son, was taught, as soon as he could speak, to trace the letters of the alphabet on sand, or with chalk upon a board, in each case pronouncing the name of the character as he traced it; so also he was taught to delineate and to pronounce words and sentences: and thus he acquired the power of reading and writing at the same time. The fancy of the child was delighted with these exercises; and so apt did his imitative faculty become, that he covered the walls of his father's humble mansion with writings, the neatness of which attracted much attention among the villagers. To the end of his days, Porson had a gift for beautiful writing, not less admirable in itself, than it was surprising as being so rare an accompaniment of profound learning. Mr Huggin Porson also exercised his son in the rules of arithmetic, and had made him proficient as far as the cube-root before he was nine years of age, without ever having used pen or pencil, book or slate: all was done through the medium of the mind only. The boy by these means acquired the power of working the most elaborate problems in numbers, without setting any of them down in a sensible form; and it is supposed that his powers of intense thinking, and of arranging the parts of any subject occupying his thoughts, were in no small measure to be attributed to this early training.

At nine years of age, he was sent to the village school, and there, under a worthy and intelligent, though unpretending teacher, named Summers, he continued for three years to pursue the same studies as he had done under his father. Summers was also a caligraphist, or practiser of beautiful writing, and helped greatly to improve young Porson in that art. Meanwhile, the father was not idle. Every evening he called forward his son, and caused him to repeat from memory the school exercises of the day, and that not in a loose or desultory manner, but in exactly the same order in which the exercises had occurred at school. There is something very remarkable in these traits of an obscure parish-clerk in an English rural county, who never would have been heard of if he had not chanced to have a child of such extraordinary genius. The methods which this poor villager took to teach his children were nearly identical with those which philosophical persons of a later day recommended as the most efficient, and which are now practised by all teachers who wish to take the best means of accomplishing the ends of their profession.

Richard remained with Mr Summers three years, and, before the end of that period, his singular propensities to study, his attention to whatever was taught him, and the wonderful fidelity with which he retained on his memory whatever he had acquired, became the subject of notice and admiration even in that rustic community. He attracted the attention of the Rev. Mr Hewitt, the officiating clergyman of the parish, who took him under his care, in order to teach him the classics. This benevolent person at the same time gave instructions to Thomas, a younger brother of Richard, who had gone to Mr Summers's school at the same time, and who was also much above the average of children in aptitude for learning. The progress of both boys was great; but that of Richard amounted to a prodigy, and soon engaged the notice of all the gentlemen in the vicinity. An opulent and liberal person named Norris heard of him, and, having put him through an examination of the severest kind, was so fully convinced of his singular capacity, that he resolved at his own expense to send him to Eton. To this seminary Porson proceeded in August 1774, when nearly fifteen years of age; and there, almost from the commencement of his career, he displayed such proofs of a superior intellect, such quickness of perception, such facility in acquirement, and such a talent of bringing forward to his purpose all that he had ever read, that he quickly reached the sixth form, the occupants of which received him with open arms into their society. As far as they could, these upper boys, as they are called, favoured him by imparting to him all they had themselves acquired; but they were more indebted to their youthful associate, who became their never-failing resource in every difficulty, as well as the leader of all their sports and frolics. That these were closely mixed up with graver exercises, appears from an anecdote which we shall venture on telling.

notwithstanding that its point turns on a language, the frequent quotation of which we conceive to be attended with disadvantages. The master had proposed as the subject of a Latin theme or exercise, the question "whether, in killing Cæsar, Brutus did well or ill," being expressed in the words, "Cæsare occiso, an Brutus benefecit aut malefecit?" A game being proposed, young Porson joined the scholars in their sports, in which he became so much engrossed that he entirely forgot the theme. When the time arrived for handing up the production expected from him, he was suddenly brought to a recollection of his duty, and, hastily snatching a pen, he wrote, "Nec bene fecit, nec male fecit, sed interfecit," that is, "He neither did well nor ill, but merely killed"—an exquisite pun, and at the same time a most dexterous evasion of a difficult moral question. The effect of this happy sentence, so unexpectedly substituted for a long and formal discussion, may be imagined. On another occasion, when the form were going up to say a lesson in Homer, Porson whispered to a neighbour, "I have lost my book; let me look over the lesson in yours." He did so—was called out to construe—went with a Virgil in his hand—and from that book appeared to read out the lesson, which, though consisting of a hundred and twenty lines, he had instantaneously fixed in his memory from a single hurried reading. Boy as he still was, he soon became remarkable for his compositions, both serious and humorous; one of which was a drama, which was exhibited in the Long Room. Too great application at one time produced effects which threatened him with consumption, but his constitution threw off the symptoms. Here, however, he lost by death his patron Mr Norris, which he lamented for reasons of affection as much as for its injury to his own prospects. Fortunately he obtained other patrons, who were equally anxious to furnish him with the means of advancement.

Towards the end of 1777, when he was eighteen years of age, he was entered at Trinity College, Cambridge. His character had gone before him to the university. He was from the first regarded as a youth whose extraordinary endowments, if life and health were spared, might be expected to add lustre even to Trinity, certainly one of the greatest and most distinguished academic bodies in the world. He at first engaged in mathematics, but soon quitted that study with little benefit, and sat down to the classics, in which he quickly distanced all competitors. He gained the prize-medal as a matter of course, and in 1781 was elected a fellow of his college. From 1785, when he took the degree of Master of Arts, may be dated the commencement of his career as a writer. The bent of his mind was towards philology and criticism. He had a singular dexterity in detecting in the Greek writers those incorrect readings which have arisen principally from the mistakes of copyists. Amongst the numerous manuscripts of ancient authors preserved in the library of Trinity College, he had found ample scope for the exercise of this talent, which might henceforth be said to be that by which he was chiefly distinguished. Some notes on an edition of the Anabasis of Xenophon, published by a bookseller at Cambridge in 1786, are said to have been his first effort in criticism which saw the light. He also contributed to the periodical works, particularly the Monthly Review and Gentleman's Magazine, many short papers of verbal criticism on ancient authors. Amongst these were some comments on the contested text of 1st John, v. 7, respecting the three heavenly witnesses, in answer to a work by Archdeacon Travis. Porson brought to bear on this question an amount of erudition and an acuteness of discrimination which excited great attention, and are now generally allowed to have set at rest a point which had long been disputed amongst theologians. Amongst other compositions of this period was a series of letters in the Gentleman's Magazine, on Sir John Hawkins's Life of Dr Johnson: they are signed "Sundry Whereof," and are full of humour and sarcasm. He speaks of "a parcel of Eton boys, not having the fear of God before their eyes, instead of playing truant, robbing orchards, annoying poultry, or *performing any other part of their school exercise*," falling foul of the knight's book in their periodical work styled the Microcosm—to which, if we recollect rightly, Mr Canning contributed. Garrick, he says, described Shakspeare as when he sat down to write dipping the pen in his own heart; so may it be said of Sir John that "he is the clerk of biography, dipping his pen into the Statutes at Large." And much more to the like purpose.

Before the period arrived when it was necessary for Porson either to enter into holy orders or to resign his fellowship, he had determined on the latter course. He was unaffectedly pious, and bore all desirable respect for the church, but his mind was not disposed to submit to shackles of any kind. He made this choice with the full consciousness that he had no other dependence for support than qualifications the profit of which is perhaps the very smallest in proportion to [illegible] in the world. His conscientiousness was their cream[illegible] measure by his being, in 1791, appointed professor of Greek in Trinity College. The salary of this office was only forty pounds a-year; but Porson hoped to make it more lucrative, as well as efficient, by delivering a course of lectures in the colleges. Being thwarted in this object, and not liking college life, he returned to London, and settled himself in an apartment of the Temple. Here he continued for some years, exercising his extraordinary powers of learning and diligence in the editing of various ancient authors, particularly the Greek dramatic poets; and it is allowed that in this particular walk he has never been surpassed or even approached by any. His life, however, was not altogether one of primitive and retired scholarship.

It is now necessary to turn from the contemplation of Porson, as a youth of obscure birth rising by the force of genius to distinction and an office of high trust, and to regard him in the light in which he appeared as a member of common society. It was not, then, vouchsafed to this wonderful man, at once to be a prodigy of abstruse learning and mental acuteness, and a steady and respectable man of the world. A strong cast of eccentricity marked the whole of his conduct. After a day of intense study amongst the intellectual great of two thousand years ago, he delighted to plunge into a common tavern, and sit smoking a pipe and drinking ale amidst the chance-collected groups which usually are found in such places. Sometimes he would be lost to his friends for weeks and months, while engaged in some huge task, such as few besides himself could have encountered; and then he would all at once burst out from his study, and be abandoned for a time to mere frivolity. In company he was apt to be egotistical and rude, and to any one who dissented from him, severe; yet he was not above endeavouring to please ladies by making for them riddles and charades, a kind of composition in which he greatly excelled. His years were devoted to the duty of clearing up obscurities in the Greek drama; yet it never could be observed that he had the least feeling for elegant literature; and the whole bent of his taste, as shown in conversation and in occasional verse-making, was towards what may be called the coarsely humorous. It may even be lamented that the powers of his mind, if superior to those of most men, were employed to purposes of by no means great importance. If well regulated and rightly directed, they might unquestionably have proved of great service to his fellow-creatures at large; used as they were, they only cleared up some obscurities in a few authors whose writings are totally unknown to the many.

A gentleman who knew Porson intimately, gave, in a memoir of himself a few years ago, some highly characteristic anecdotes of the learned man, some of which we deem it worth while to include in this short paper. "I had invited him," says this writer, "to meet a party of friends in Sloane Street, where I lived; but the professor had mistaken the day, and made his appearance in full costume the preceding one. We had already dined, and were at our cheese. * * * 'Your blunder, my friend, will cost me a beef steak and a bottle of your favourite Trinity ale; so that you will be the gainer.' He sat on, 'as was his custom in the afternoon,' till past midnight, emptying every flask and decanter that came in his way. As I knew there was no end to his bacchanalia when fairly seated with plenty of drink and a *listener*, I retired without ceremony, leaving him to finish the remains of some half dozen of bottles; for the *quality* of the stuff was immaterial to the professor, provided he had *quantity*. On my descending the following morning to breakfast, I was surprised to find my friend lounging on a sofa, and perusing with great attention a curious volume of Italian tales, which I had picked up in my travels. I learned that, having found the liquor so choice, and the *Novelle Antiche* so interesting, he had trimmed his lamp, and remained on the premises. 'I think,' said he, 'that with the aid of a razor and a light-coloured neckcloth and a brush, I shall be smart enough for your fine party.'

A pretty large company assembled in the evening, and Porson treated them with a translation (without book) of the curious tale which had excited his notice.

So extraordinary was his memory, that although there were above *forty names* introduced into the story, he had only forgotten one. This annoyed him so much that he started from the table, and after pacing about the room for ten minutes, he stopped short, exclaiming, 'Eureka!' [I have found it]. 'The count's name is Don Francesco Averani!'

The party sat till three o'clock in the morning, but Porson would not stir; and it was with no small difficulty that my brother could prevail on him to take his departure at *five*, having favoured me with his company exactly thirty-six hours! During this sitting I calculated that he finished a bottle of alcohol, two of Trinity ale, six of claret, besides the lighter sort of wines, of which I could take no account; he also emptied a half-pound canister of snuff, and during the first night smoked a bundle of cigars!"*

Being on terms of intimacy with Mr Perry, the editor of the Morning Chronicle, Porson formed an attachment to a sister of that gentleman, a Mrs Lunan, a widow. He was not supposed to be a person likely to contract marriage, more especially a marriage of inclination; but in this notion his friends were found at fault. According to the memoirist already quoted, "One night, while he was smoking his pipe at the cider-cellar in Maiden Lane (his favourite haunt) with my brother, he said, addressing his companion, 'Friend George, do you not think the widow Lunan an agreeable sort of personage, as times go?' throwing out a huge volume of smoke. An affirmative nod, and a compliment to the lady, was the reply. 'In that case you must meet me at St Martin's-in-the-Fields to-morrow morning at eight o'clock,' rejoined the other; and so saying, and finishing the remnant of his liquor, he threw down his reckoning and retired. My brother, who knew his man well, though not a little astonished, determined to attend to the invitation, and at the hour fixed repaired to the church, where he found the professor and the fair widow attended by a female friend, with the parson and his clerk. The licence being produced, the ceremony (a very short one) took place, when the parties separated, the bride and her friend retiring by one door, and Porson and his *man* by another. It appeared that the alliance had for some time been contemplated, but the lady objected without her brother's approbation; on this point, however, Porson was immoveable; and the widow, well knowing his temper, at length gave her consent to the clandestine step. My brother now urged him to declare his marriage to Mr Perry, who he could not doubt would be speedily reconciled, though perhaps hurt at not being consulted; but the professor would not listen to this advice, and they parted. * * In a few hours, however, the Benedick entered in his best dress, namely, black satin nether garments and ruffled shirt, which he only wore on solemn occasions. 'Friend George,' said he, 'I shall for once take advice (which I seldom do, as you know), and hold out the olive branch, provided you will accompany me to the Court of Lancaster.* You are a good peace-maker.' They got into a hackney coach and found Mr Perry at home. The bridegroom was presented, made a speech, and though his friend's self-love was a little ruffled, a reconciliation soon took place, a few friends were summoned in haste, a handsome dinner was served, and an apartment was provided for the newly married couple." The lady died of decline, in 1797, after having been married only two years to the professor.

A remarkable anecdote of the persevering application of which Porson was capable, is told with reference to this period of his life. He had obtained from the library of Trinity College a manuscript of great value in the eyes of the learned world, namely, a lexicon or dictionary of the Greek language, which had been compiled in the seventh century by Photius, a patriarch of Constantinople. Porson employed ten months in copying this work in his beautiful hand; a great task, certainly, when we consider the care necessary at once for correctness, and for the elegance of the penmanship. Most unfortunately, in a fire which burnt down Mr Perry's house at Merton, this copy was destroyed. The original might have met the same fate, if Porson had not made it a point of conscience to carry it with him wherever he went, from consideration of its value, and of its having been entrusted to him by his college; and he then chanced to be absent. Unruffled by the loss, the patient scholar sat down and made a second copy as beautiful as the first. He afterwards prepared this work for the press, but did not live to publish it. It may here be remarked, that Porson seemed to like the business of copying—a most surprising taste, considering the liveliness of his faculties, but which was probably owing to his early training in caligraphy. It was regretted by many that he spent so much time in that employment, which might have been better spent in the duties of the critic and annotator.

From 1797, Porson was afflicted with a spasmodic asthma, by which his studies were rendered still more desultory than before. During the attacks of this malady, he could not go to bed, and deemed it necessary to deny himself all sustenance. It is probable that, with regularity of life, and a due submission to medical advice, he might have overcome the disease; but Porson could neither restrain himself from convivial indulgences, nor admit that physic and physicians had any power over human ailments. He continued, nevertheless, to devote much of his time to study, and, besides publishing several of the plays of Euripides, with such learned notes as the world had never seen equalled, he had lent considerable aid to an edition of Æschylus, which appeared in 1806. He also paid occasional visits to Trinity College, where he was received as a kind of divinity, being the very prince of the little domain of talent which was most appreciated there. In 1807, by the interest of some friends who were anxious to obtain for him a regular means of livelihood, he was appointed librarian of the London Institution, with a salary of L.200 a-year, which was probably much beyond what he had any inclination to spend. But he was not long to enjoy this congenial office.

He had latterly been much weakened by the asthma, and in the autumn of 1808, being attacked by intermittent fever, instead of having recourse to medical advice, now imminently necessary, he only resorted to his usual expedient of abstinence from food, by which he reduced his stomach so much that it entirely lost its tone. One evening [Monday, 19th September], he crawled forth to take a walk in the Strand, when he was suddenly seized with a paroxysm of the nature of epilepsy, to which he had been subject at an early period of his life. To quote an account given to the public at the time—"Not being known to the persons who witnessed his situation, he was conveyed to the St Martin's workhouse, where he continued in a state of total insensibility until about six o'clock on the

* "Personal Memoirs, or Reminiscences of Men and Manners," By Pryse Lockhart Gordon, Esq. 2 vols. 1830.

* This seems to have been a jocular term for Mr Perry's establishment which was in Lancaster Court.

following morning; but one of the attendants of the London Institution, seeing a paragraph in a paper stating that circumstance, and that the gentleman carried to the workhouse had a memorandum-book, with some Greek notes, in his pocket, supposing it to be Mr Porson, repaired thither, and brought him to his house in the Old Jewry, where he arrived a little before ten on Tuesday morning." For some hours he sat and conversed in the library, but going out again at three o'clock, he was seized with the former symptoms, was again brought home, and after a few days of torpor, breathed his last. The immediate cause of his death was believed to be the abstinence which he had so injudiciously practised. He was buried with great state a few days after in the chapel of Trinity College, when Greek epitaphs were strewed in profusion on his coffin, and learned recluses were seen to weep as his body was lowered into the tomb.

This is no place for a laborious description of the literary character of Porson, or of his works. It may be remarked, however, that, as an union of great acuteness of intellect with vast memory, of the most sedulous application to a dry study with uncommon wit and sprightliness, of the simplicity of the student with habits of extreme conviviality, it is scarcely surprising that he should have excited so much wonder amongst his contemporaries, and should still be looked back to as a kind of prodigy. With regard to personal matters, his head, we are told by Mr Gordon, "was remarkably fine, an expansive forehead, over which was smoothly combed (when in dress) his shining brown hair. His nose was Roman, with a keen and penetrating eye, shaded with long lashes. His mouth was full of expression, and altogether his countenance indicated deep thought. His stature was nearly six feet. He was fond of reciting favourite passages from Shakspeare. The fine intonations of a melodious voice, and the varied expression of his features, on these occasions, were admirable." The political professions of Porson were those of a Whig; but he paid little attention to subjects of that nature.

NARRATIVE OF A PRISONER OF STATE.*

On referring to No. 351 of the Journal, the reader will find an outline of the first part of a narrative by Alexander Andryane, a young Frenchman, whose enthusiastic sentiments on the subject of national liberty had led him to involve himself in the attempts made about seventeen years ago to subvert the Austrian power in Italy. Having been arrested and thrown into prison in Milan, Andryane there underwent a year's severe suffering, both bodily and mental, and finally was condemned to *imprisonment for life* in the too famous fortress of Spielberg, situated near Brunn, in the Austrian province of Moravia. His first narrative, published in 1838, contained an account of his adventures up to his entrance into that dungeon, which took place in the beginning of the year 1824. A second part, which has just issued from the press, now lies before us, and is devoted to the history of Andryane's captivity at Spielberg, where Silvio Pellico, Confalonieri, and other Italians of distinction, were his fellow sufferers. Both narratives have been ably translated from the original French by Fortunato Prandi, an Italian at present residing in England.

At his last parting with his sister, before being conveyed from Milan to Spielberg, Andryane had exclaimed to her, "I am buried at five-and-twenty, but my resignation will not abandon me. Under all circumstances I hope I shall prove worthy of you." On first beholding Spielberg, however, the captive had some difficulty in maintaining his composure of mind. The fortress is described by him as "an oblong square, surrounded on every side with buildings, whose narrow grated windows, and low iron-studded doors, would have filled us with dismay had we been there merely as visitors." On entering the building, and being led to the cell destined for him, Andryane was still further moved. "When I saw before me the dark den in which they were about to entomb me, I could not help exclaiming in agony, 'Merciful heaven! am I condemned to live in such a place as this?' A pallet bed, a pitcher, and a tub, formed the whole of the furniture. Used as I was to the nakedness of prisons, and the privation of every thing most essential to life, this utter destitution made my heart shrink." The treatment to which the prisoners were subjected at the very outset, accorded but too well with the character of the scene. "Soup garnished with lumps of tallow," and filthy black bean-bread, constituted the food placed before them. Such was the vile odour of these articles, and the unclean condition of the iron porringers containing them, that Andryane and Colonel A——, the companion with whom he was at first shut up, could not touch the meal, in spite of all their hunger. "The narrowness, also, of the cell (says Andryane) precluded my walking; a dreadful torture, after the restraint I had endured on the journey." When he lay down on his hard pallet, its scanty size caused him to tumble off it every now and then, and the challenges of the numerous sentries, repeated loudly every quarter of an hour, aided in banishing repose. On the second or third day he was dressed in a coarse particoloured uniform, and his limbs were permanently cased in irons, heavy and long. Each prisoner was allowed a separate daily walk of half an hour, on a sort of terrace or platform, with one attendant guard.

Such were the circumstances in which Andryane found himself placed at the commencement of his captivity. His companion, Colonel A——, being one who had shown symptoms of defection from the cause of Italian emancipation, the young Frenchman sought amusement chiefly from books, which were at first freely granted for the use of the prisoners. Incidents soon occurred, however, to break up the wearisome monotony of the captive's life, and the first was the receipt of a letter, through the hands of a convict, one of those who were confined for civil crimes in the fortress. This man, who was very useful afterwards in carrying secret communications between the political captives, had been appointed to attend to the needs of their cells. One day, Andryane saw him make signs, as if he wished to say something not proper to be known by the other attendants who were present. "What could he want of me? I tried in vain to divine. At last, one day, he drew from his pocket a little packet, very dirty and much worn. This he adroitly placed under our jug as he filled it, indicating by a side-glance of his eye, as he departed, the treasure which he had confided to my honour. The door closed—I hurried to gain the packet: it contained a phial of reddish liquid, the stump of a pen, and a letter worded nearly as follows:—'We are ignorant of your names; but your misfortunes and ours are the same, and on this ground we address you. Let us know who you are: tell us about Milan, about Italy, about every thing. During the two years that we have been here, no news has reached us. Write without fear; we vouch for the messenger. Reply quickly, for we burn to hear by what fatal destiny you, like us, have been buried in the tombs of Spielberg.

SILVIO PELLICO,
PIERO MARONCELLI.'"

This epistle was the forerunner of various others from the high-minded Pellico, and Andryane contrived to answer him by means of the same convict, who was a dexterous and good-natured rogue. This interchange of sentiments was inexpressibly pleasing to all parties. After some months of durance, a new source of pleasure dawned on Andryane. The commandant of the fortress entered his cell one morning, and desired him to rise and follow, as a new companion had been allotted to him. In a few minutes he found himself in the arms of Confalonieri. With this nobleman, a man of high honour, superior talents, and many virtues, Andryane had become acquainted during their former sufferings in Italy. The count was in miserable health, and great exertions had been made to procure his liberation, but in vain. He and Andryane were more peculiarly attracted to one another by the circumstance of their having been the two victims at first selected for the scaffold—a doom commuted to imprisonment for life. The society of the count was productive of the deepest pleasure to the young Frenchman. They continued to correspond with Pellico, and after a time had the gratification of seeing him. An ecclesiastic, named Paolowitz, arrived at Spielberg, commissioned, as it afterwards proved, to keep up an espial on the prisoners. In the first instance, however, he did them a good turn by procuring them permission to attend the chapel on Sundays. The scene which took place on the first occasion is thus described by Andryane:—"At a given signal, all the state-prisoners came out into the corridor. This unexpected meeting, after so many months of separation, was a moment of happiness. They embraced and wept over each other: then all gathered round Confalonieri, giving tokens of the truest affection and veneration. Thus surrounding him, we all advanced towards the chapel. On crossing the platform, the ravages which captivity had made upon each became strikingly visible. 'Ah, there is poor Pellico!' exclaimed Borsieri, in a tone of fraternal fondness. 'How altered he is!' and with his finger he pointed out that Silvio, whom we all loved, and whose features I was so desirous of contemplating. Never did I gaze upon a countenance more sweet and yet melancholy in its expression; never did features more accurately correspond with the picture of ingenuousness and angelic goodness I had preconceived in my mind of the author of those letters which revealed in every line so many adorable qualities. His pallid forehead, chiseled in the noblest proportions—his eyes, so full of tenderness and inspiration—the smile upon his lips, from which never proceeded aught but tolerance and love, produced an impression so touching in their resignation, that I was ready to cry out, 'Silvio! do I behold thee at last? Silvio, I love thee, and would gladly give half the days of my life to clasp thee in my arms!' Most deeply did the sight of this celebrated author of the Francesca da Rimini awaken my sympathy; and the thinness of his cheeks, the wanness of his complexion, augmented it. Too clearly did they indicate the effects which the rigours of long captivity had wrought upon a frame naturally delicate."

These Sunday sights of one another, for they were but sights, gave much satisfaction to the poor captives; but they were doomed to fresh misfortunes. The chief source of their consolation, the books which lightened their gloomy dungeons, and rendered palatable their coarse and filthy food, were taken away from them through the instrumentality of Paolowitz. "Ah, sir (said Andryane on the occasion to the governor), this is a second sentence of death! My own affliction," he continues, "at this dreadful announcement, was shared by every one in the prison. One universal cry was uttered against the author of this inhuman deprivation." To add to their distress, they could not now procure paper for the maintenance of their occasional correspondence. Their books had furnished them with odd leaves and scraps, but now they had nothing but brown paper; and until one of their number struck out one of those ideas that necessity alone can give birth to, they were greatly at a loss. "Vainly had we long attempted to make the brown paper serviceable. It would not allow the pen to glide, and it imbibed the ink like a sponge. Every thing that we wrote upon it immediately became an illegible blot. Trial after trial had failed, and at last we abandoned the scheme as impracticable. Maroncelli, more persevering, at length succeeded. Nothing could equal the joy with which I received a letter from him, written on this coarse paper. 'Behold, my friends,' it said, 'the difficulty is overcome. The pen runs freely; the ink does not spread. At first I rubbed the paper again and again—rubbed it till my arms ached—in the hope of rendering it more compact and smooth by friction; but despite all my pains, it would not take the ink. The idea struck me at last that it was size that it wanted. Accordingly I dissolved some crumbs of bread in our jug of water, and steeped several slips of the paper in this infusion during the night. This morning I dried and then rubbed them perfectly smooth with the back of my wooden spoon, after which I took my pen, and distinctly traced on one of them these words: "Praised be the Lord our God, for that he is good, and hath taken pity on us!" Succeeding attempts have been even more satisfactory. Try it, my friends, by immediately writing one of your affectionate letters upon the slips which I send you herewith.'"

Their ink, however, failed also; their convict purveyor could bring no more *soot*, and they used out all the bits of brick within their reach. This dilemma gave occasion to one of the most striking and noble instances of fraternal devotion which the history of mankind can perhaps present. Andryane had begun a literary work; which he could not proceed with for the want of ink. "I announced (says he), by a few scarcely legible characters, my distress to Pellico and Maroncelli, when sending them by the faithful Caliban the first part of my work. Great was my surprise and emotion when I received two days afterwards from my friends, a packet containing my manuscript, a quantity of blank slips, a little phial of *red liquid*, and the following note from Pellico:—'Your interesting pages have made us shed tears: we thank you for their perusal. How great is the goodness of God in allowing us the enlivening consolation of our friendship! Yours is a work inspired by Providence, and you must finish it. So long as any blood remains in my veins, I shall rejoice if you will employ it. I wish it could as well burn in a lamp, and enable you to devote more time to a composition, of which the beginning has excited the most powerful interest in our hearts.'" In short, Silvio Pellico enabled his friend and fellow sufferer to write, by yielding him the *blood of his own veins for ink!* Andryane tried to extract blood from his own arm for the purpose, but he admits that his "constancy or his cleverness failed him. Pellico guessed this, and obliged me to receive another phial, protesting that it should be the last. Does the poor man, who shares all he possesses with one poorer than himself, do more in the eyes of God than my angelic friend, suffering and weak as he was, did for me!" In justice to Andryane, it should be told that he exclaimed against the repetition of this sacrifice. He wrote to Pellico, saying, "The very idea that your health may suffer shocks my feelings. Do preserve in future your precious blood: I will not be the occasion of your losing one drop more. As to that which you have already sent, I will do every thing in my power to employ it worthily: and if God in his goodness permit that, in quitting Spielberg, I am able to save the pages I now write, I shall show them to every one as the most admirable proof of devotion and charity that one captive ever received from another."

Months, years, ran past, and the captives became the subject of still more severe treatment. The priest Paolowitz, because he could not extract confessions from single individuals that would hurt their friends, represented them all as obstinate criminals to the Austrian emperor. They were subjected to such examinations as the following. A police director closely examined their cell, and then said, "'Now, undress yourself.' 'Undress myself, sir!—but it is very cold.' 'The order is such,' he replied, drily. 'I submit, sir,' and I took off my clothes: but that was not enough; he required me to pull off my shoes and stockings, and even my shirt. I reddened, and feeling my patience going, I asked the director whether he might not save me the mortification of remaining naked before the eyes of every one. 'It is the order.' 'Since, then,' said I, sorrowfully, 'the cup of bitterness must be drained to the very dregs, it shall be done. But I must confess, sir, that after three years' imprisonment I was far from expecting such severity.' I then gave my last garment to the director's acolyte, and remained with my eyes bent on the ground, my

heart filled with indignation, while my whole person, and the coarse shirt that a beggar would not have worn, were passed in review. 'Is it over, sir?' I asked of the director, seeing myself no longer under inspection; 'and may I put on my clothes?' 'Not yet—in a short time; only take your shirt.' 'What! am I to remain longer in this state of nakedness?' 'It is the order; I cannot help it.' And saying this, he made a sign for the straw mattrass, counterpane, and clothes, to be carried out of the room, leaving me exposed to the damp and cold air of the dungeon, and to the gaze of all the bystanders. This noble exploit ended, the director made me a slight bow, and turned to Confalonieri, who was subjected to the same indignities as myself. He also, though suffering, was obliged to get up to yield his miserable couch, his convict clothing, and even his feeble body, to their examination. It was an afflicting spectacle to see the man I most loved and revered in the world, treated by these ruffians of the police like the worst malefactor: to see him stand with naked feet, stripped of every particle of dress, before these tools of arbitrary power, who neither respected his grey hair, blanched by sorrow and suffering, nor the infirmities consequent on his imprisonment, nor the noble dignity of his character. Yet this man, on whom they dared to lay their impure hands, endured the unworthy treatment with the most admirable patience. Not one word of discontent escaped his lips, no sign of contempt or of anger was depicted on his countenance." They were left in this state of nakedness till Confalonieri had almost perished.

For being kind to the prisoners, the head keeper of the fortress, an old soldier named Schiller, was turned out of his place. The disgrace broke the aged warrior's heart. Andryane seized an opportunity to express his gratitude to Schiller. "Thanks, thanks!" said the other; "ere long I shall cease to want any thing in this world. I am hit *here* (striking his breast). If our emperor knew that you are a hundred times worse off than the greatest malefactors we have here, I am sure he would never permit that I should be punished for leaving you some pieces of bad paper and a few old quills. Yet God will not punish me for pitying my poor prisoners." Schiller seems to have done the Emperor of Austria too much justice here. Every point in the prison regulations was arranged by the monarch himself, and in the third year of the captivity of Andryane, the situation of things became much worse for him and his companions, through particular orders from Vienna. The jailors became more stern and vigilant, and daily inspections were made, of so rigorous a nature, that the captives were deprived of almost all the petty sources of amusement which they had at first possessed. For example, a small leather pillow had been allowed to lie on the pallet of the sick and suffering Confalonieri. It was peculiarly dear to him as the last and only souvenir which he possessed of his beloved wife, who, on her journey from Vienna to Milan, to see (as she believed) her husband's execution, had rested on that pillow her throbbing head, and bedewed it with her tears. It was taken from the count, his retention of it being an "infraction of the rules." A young sparrow had been caught by one of the captives, and he had tamed it and taught it to love him. It had become his chief consolation, but was taken away, as an "infraction of the rules." Again, the captives, though chained, could mount to their narrow loop-holes, and get partial glimpses of the face of nature. Some of them passed whole days in this occupation. Alas! they were not permitted to taste the enjoyment long. "I perceived several persons examining the bastion, and I shuddered at the idea that we should probably be the victims of some new persecution. Soon afterwards, the appearance of some masons, bringing bricks and scaffolding in great quantity, confirmed our apprehensions. The work was immediately begun; and during that day, and several others, we contemplated with increasing sadness the men who raised the wall of the parapet, and by degrees concealed the cheering landscape from our view. This barrier of stonework, which an evil genius seemed to have placed between us and nature as a warning that we were to renounce for ever the joys of this world, augmented our wretchedness fearfully, and the health of several of the prisoners sustained an irreparable shock. Confalonieri suffered more from it than any other."

The subsequent details of this rigorous imprisonment are of remarkable interest, and serve to throw an instructive light on the nature of the Austrian government. These details will be presented in a condensed form in our next publication.

THE CONTRADICTORY COUPLE.

"I do believe," he says, taking the spoon out of his glass, and tossing it on the table, "that of all the obstinate, positive, wrongheaded creatures that ever were born, you are the most so, Charlotte." "Certainly, certainly, have it your own way, pray. You see how much *I* contradict you," rejoins the lady. "Of course, you didn't contradict me at dinner-time—oh no, not you!" says the gentleman. "Yes, I did," says the lady. "Oh, you did!" cries the gentleman; "you admit that?" 'If you call that contradiction, I do," the lady answers; "and I say again, Edward, that when I know you are wrong, I will contradict you. I am not your slave." "Not my slave!" repeats the gentleman, bitterly; "and you still mean to say that in the Blackburns' new house there are not more than fourteen doors, including the door of the wine-cellar!" "I mean to say," retorts the lady, beating time with her hair-brush on the palm of her hand, "that in that house there are fourteen doors, and no more." "Well, then," cries the gentleman, rising in despair, and pacing the room with rapid strides, "this is enough to destroy a man's intellect, and drive him mad!" By and bye the gentleman comes to a little, and passing his hand gloomily across his forehead, reseats himself in his former chair. There is a long silence, and this time the lady begins. "I appealed to Mr Jenkins, who sat next to me on the sofa in the drawing-room during tea." "Morgan, you surely mean," interrupts the gentleman. "I do not mean any thing of the kind," answers the lady. "Now, by all that is aggravating and impossible to bear," cries the gentleman, clenching his hands and looking upwards in agony, "she is going to insist upon it that Morgan is Jenkins!" "Do you take me for a perfect fool?" exclaims the lady; "do you suppose I don't know the one from the other? Do you suppose I don't know that the man in the blue coat was Mr Jenkins?" "Jenkins in a blue coat!" cries the gentleman, with a groan; "Jenkins in a blue coat!—a man who would suffer death rather than wear any thing but brown!" "Do you dare to charge me with telling an untruth?" demands the lady, bursting into tears. "I charge you, ma'am," retorts the gentleman, starting up, "with being a monster of contradiction, a monster of aggravation, a—a—a—Jenkins in a blue coat!—what have I done that I should be doomed to hear such statements?"—*Sketches of Young Couples*

THE EDIBLE BIRDS' NESTS OF CHINA.

Not only in their ordinary form, or acted upon by the culinary art, are the mosses employed as food; but one of the most admired luxuries of the table in China is the edible birds' nest formed from them. A small swallow, called, from his peculiar instinct in building this sort of habitation, *hirundo esculenta*, makes his nest from several of these species, and amongst others, it is said, from the Ceylon moss, in the highest and most inaccessible rocks, in deep damp caves. Craufurd tells us that none but those accustomed from childhood to the dangers it offers, can pursue the occupation of collecting these nests; for they are only approachable by a perpendicular descent of many hundred feet, by ladders of bamboo and ratan, over a sea rolling violently against the rocks. When the mouth of the cave is attained, the perilous task of taking the nests must be performed by torchlight, by penetrating into the recesses of the rock, where the slightest slip would instantly be fatal to the adventurers, who can see nothing below them but the turbulent surf making its way into the chasms of the rocks. The high price given for these delicacies, is, however, a sufficient inducement for the gatherers to follow "this dreadful trade." The nests are formed of a mucilaginous substance; they resemble ill-concocted fibrous isinglass, and are described as of a white colour, inclining to red; their thickness little more than that of a silver spoon, and the weight from a quarter to half an ounce. When dry, they are brittle and wrinkled, the size nearly that of a goose's egg. The qualities of the nest vary, according to the situation and extent of the caves in which they are found, and the time at which they are taken; if procured before the eggs have been laid, the nests are of the best kind; if they contain eggs only, they are still valuable; but if the young are in the nest, or have just left it, they are nearly worthless, being dark-coloured, streaked with blood, and intermixed with feathers and dirt. After they are procured, they are separated from feathers and dirt, are carefully dried and packed, and are then fit for market. The best sort are sent to Pekin, for the use of the emperor. The labour bestowed to render them fit for table is enormous; every feather, every stick, or impurity of any kind, is carefully removed, and then, after undergoing many washings and preparations, they are made into a soft delicious jelly; they are likewise served up in broths and soups; they have the reputation of being nutritious, and gently stimulating. The extravagant prices given for these nests by the Chinese render them a most expensive article of diet. The sale has become a monopoly of the government in whose dominions they are found. Meyen, in his Voyage Round the World, states that the Japanese had long ago discovered that these costly birds' nests are nothing more than softened sea-weed, and that they now prepare the substance itself in an artist-like manner.—*Dr Sigmond on the Ceylon Moss.*

LADIES IN BARRACKS.

The promising young lady, newfangled in her matrimonial reign, and by the royal duties thereto appending (the *moon* being over), is delighted to get into military quarters. I have seen one of these young things almost leaping out of her skin with joy upon her first entrée. This agreeable state of matters was, however, of short duration; she soon regretted her lately forsaken and peaceful haunts; when, instead of either leaping or dancing for joy, she tamed down into a very languishing, slipshod housewife. She was married to a jolly ensign, of whom, poor fellow, it might literally have been said that he was "twice caught." Light marching order was not the order of *his* day; he travelled with a most respectable train of baggage. A pianoforte was on the list; for which his only room not being sufficiently capacious, the quartermaster's store received it, where the rats and mice played their duets and overtures upon it. Chests and trunks abundantly came in, so that the poor disciple, and the partner of his cares, were stowed away among the lumber, very much after the manner in which the steerage passengers are ensconced on board a packet just ready to sail for Van Dieman's Land. They had some pretty little birds in brass wire cages, and a green parrot to keep them from being alone. By and bye, the scene was changed, and other little birds were heard to sing; the piccaninnies began to show themselves, and were introduced into this sinful world much more rapidly than the finances of their parents justified; "the love they were so rich in" would by no means "make a fire in their kitchen;" for kitchen they had not, nor would the little god turn their spit. Fertile in expedients, the sex are never at a *nonplus*; bandboxes and parasols made way for canisters and rocking-chairs; bird-cages were dismissed for cradles; the washing-tub took precedence of the guitar; and as for the feathered songsters, they were all consigned to other lodgings; their places in the orchestra being occupied by a band of innocent squallinis. Barrack ladies are, for the most part, very clever, good hands at a dish of scandal now and then, as well as getting up a dish of mutton-chops. They, moreover, cultivate the gossiping propensities, for which there could not be a more eligible nursery. They are for ever sifting and prying into one another's business; and politics run so high at times that the interference of their lords and masters is resorted to in order to check the progress of a civil war. Woe betide the unlucky, though quiet youth, who may chance to be within the range of one of our musical amateurs; who produces a sensation as if she was hammering on his nerves, instead of on the keys of her piano: it is one tormenting strum, strum, strum, at the "Downfall of Paris," and "Fly not yet," when you would fly with eagles' wings to the antipodes. I was at one time *vis-à-vis* to such another lovely cantatrice, who harped alternately on "Drink to me only with thine eyes," and "From night till morn I take my glass;" her face, meanwhile, resembling the full moon in a gale, and bearing the roseate hue of wine, was a faithful illustration of her song.—*Major Patterson's Camp and Quarters.*

THE FIRST SWALLOW.

BY THOMAS SMIBERT.

White-throated herald of the coming May,
It joys me much to see thee here again!
Once more shalt thou, sweet bird, at dawn of day,
Chase my dull slumbers with thy cheerful strain;
Thy parent-labours, at my window-pane,
With placid morning thoughts my breast shall fill,
And I shall quit my bed,
Full-fraught in heart and head
With soothing trust in God, and unto all good-will.

Who can behold the nicest art and care,
With which thou labourest thy little home,
Nor think of Him, whose hand is written there—
Ev'n on thy tiny edifice of loam—
As visibly as on the vast air-dome!
Or who can mark the fond firm ties that bind
Thy chosen mate and thee,
In toils alike and glee,
Nor yearn with deeper lovingness for all his kind!

On thee, indeed, and all thy dark-winged race,
Who cleave the air or skim the glassy pool,
Conspicuous are the tokens of His grace,
Who holds infinity beneath his rule:
When autumn winds our norland climate cool,
Doth He not kindly lead you far away
To some more sunny land,
Where skies are ever bland,
And make your span of life one long bright summer's day?

So do we oftest deem, at least, of thee,
Sweet page, that holdest up the skirts of spring!—
Usher of flowers—foretype of songs to be,
Albeit less perfectly thyself may sing!
Yet doth a veil hang o'er thy passaging:
Haply thou hiest thee, as some do say,
To lonely pool or brook,
Or dark secluded nook,
And there, like bedded stone, dost sleep the cold away.

Dark as the polar secrets of the north,
Have been thy ways, thou pilgrim of the sky,
Since, bringing light and life, Time first stood forth,
A finger-guide in bleak eternity:
Though questioned long by man's deep searching eye,
Thy course is full of doubt, when all is done,
And still we can but guess,
That when the chill winds press,
Thou seek'st a home in climes that front the prone-rayed sun.

Welcome, thou gentle haunter of the eaves!
Gladly I welcome thee, come whence thou may;—
Whether the spirit that evolves the leaves
Hath from the deep awakened thee to day,
Or thou from far-off lands hast winged thy way.
I love thee, and with joy will watch anew
The labours, to and fro,
Which thou must undergo,
Ere from their beauteous shells thy young step forth to view.

Men wrong thee, my poor bird, when they compare
A summer-fly of human kind to thee;
Although thou comest when the skies are fair,
And at the winter's touch dost straightway flee,
No faithlessness in thy career we see;
Thy comings and thy goings both are sure:
And could'st thou choose, my bird,
Thy flight should be deferred,
And through the year thy stay, I know, should aye endure.

More justly wert thou likened to the young,
Who immaturely quit us in their noon,
And most of all to those whose lips have sung
The brief preludings of a pleasant tune,
But have grown dumb and bloomless all too soon!
These are thy prototypes;—but as we bend
With meekness to the blow,
That lays such dear ones low,
Be we content with what we have of thee, sweet friend!

April 29, 1840.

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 437. SATURDAY, JUNE 13, 1840. PRICE THREE HALFPENCE.

EYE HINTS.

It is remarkable how small a peculiarity in form, posture, or arrangement, suffices to give us a genoral idea of an entire object, and not only of that, but of many things and conditions relative to it. In a popular book of travels we are presented with a plate, representing the lower part of a pair of limbs projected through a window into the open air; and from that fragment of a gentleman, we can in an instant form an idea of the attitude, bodily and mental, of the whole man. He is a jolly Carolinian, sitting on a rocking-chair, smoking his pipe, and conscious of nothing but the pleasant sensations which follow a good dinner. We are often reminded of this whimsical engraving, as we daily pass one of the club-houses. There, within a window through which one can see from the street, is generally to be seen some snatch of a human figure. Very frequently the object seen is the back part of a head, the owner of which has come to the light to read the newspapers. One just catches a bald crown, below that some short grey hair, and below that again some very red layers of neck. Nothing else is needed. It is a country gentleman of course; one who has been familiar with good port for half a century. Being now temporarily in town, he has called to have his daily spell of the Post or Chronicle, as it may be. Such an object is at once recognised as characteristic of the place, and quite suitable to it. And though the whole man were standing before one, one could not see him more palpably.

The least hint, indeed, suffices. Hence it is quite possible, in casting one's eye along a crowded street, to point out all the proud people within a quarter of a mile, at least all those who are walking away from the position of the spectator. Mark where you see much of the crown of a hat. Wherever that is the case, and the individual is receding, you have a proud man; for, in walking, such men throw back the head, and that enables any one behind to see a good deal of the crown. On the other hand, when much of the crown of an *approaching* hat is seen, the probability is, that the owner is a studious, or bashful man, or one who feels that he has little reason to expect much courteous regard from his fellow-men. One only source of fallacy besets our outlook for proud men. There are a few old gentlemen, very generally belonging to one of the learned professions, who, in consequence of sedentary life, and through other causes, have become very corpulent in front; by reason of which peculiarity, they are obliged to keep their heads pretty well back. It is just possible that a crown of a hat brought much into view behind, may belong to some such person. This, however, is only an exception from a rule which will generally be found to hold good.

When a lady and gentleman are seen walking together, no person of average acuteness of intellect can be at a loss to distinguish whether they are married persons or not. There is a well-known pair of prints, common in wayside country houses, professing to represent Courtship and Matrimony. In "Courtship," a gentleman is seen displaying great attention to a lady, in helping her over a stile, which she seems at no loss to mount unassisted. In "Matrimony," the same lady is seen attempting with some difficulty to get over the same stile, while the gentleman, already past, is walking coolly and unheedingly on in front. The design of this print has always appeared to us a shameful libel on matrimony. We truly believe the conduct of the gentleman to be capable of explanation. The thing is this. In the first print, he was full of solicitude and anxiety, as all persons who have not the good fortune to be married must be; and this solicitude made him fussily eager to help the lady where she did not need help. By the time, however, that we have him in the second print, he has been made as happy as man can be. His mind has been brought into a state of delightful calm, so much so as to amount to abstraction. So completely has he been rapt by his happy sensations away from all common thoughts, that he has forgot the very person who has been the occasion of all his felicity. But this obliviousness, judged in a liberal sense, is just the highest compliment he could pay to his wife. So, in the ordinary paths of the world, when a lady and gentleman are seen walking together, if you observe in the latter an air of undue solicitude about his companion; if he inclines much towards her, and seems over-polite; and if she, on the other hand, looks a little flurried and frivolous, and appears far more interested about the way her reticule hangs than there is any occasion for; then know that these are unmarried parties. But if the gentleman and lady walk on quietly arm in arm together, both quite upright, and just behaving as a lady and gentleman in their sober senses ought to do, then believe that these persons are married; for now, with both, all anxiety is past, the days of frivolity and fuss have been succeeded by a lady-and-gentlemanlike style of happiness, and all is contentment and peace.

If you observe a pair, who are obviously from such appearances married, entering their dwelling, and should you wish to know whether they have any children, cast a glance at the windows; and if you see a little dog sitting wagging his tail at one, and a macaw chattering on his beam at another, you will be safest to conclude in the negative. But should you perceive no such objects, not even a few flower-pots on the balcony at the drawing-room windows, and, looking a little higher, see two windows with wooden bars across them, you may be as sure there are children in the case, as if you saw the chubby rogues staring through the panes, or heard their merry shout as papa and mamma enter.

The world is familiar with the story of the physician who concluded that his patient had been eating oysters from seeing some shells of that species of the testacea under the bed, and how finely this surmise was commented on by his apprentice, who, going to another patient, and observing a saddle under the bed, came home and reported that the man must have lately eaten a horse. In the case of the oysters, it must be owned that possibly the patient had not been eating any such thing; yet a strict regard to the principles of reasoning obliges us to believe that it was much more likely that oysters had been gobbled in the one case, than that a courser had been bolted in the other. To be very candid, there might be some rashness in the physician's conclusion. The oysters might have been eaten by some other member of the family. Yet, after all, it was not unlikely that they had formed a regale to the patient himself. We know very well that from similar evidence conclusions are come to every day in the world. Old Mr Towser, of a certain town in the west of England, had a large dog remarkably like himself, and which was intimately associated by every body with the idea of his own figure. Whenever this animal was seen at the door of the Bridgewater, did any passer by ever presume to doubt that Mr Towser was sitting in his ordinary seat at the bar fireside, taking his glass of brandy and water? Convictions from such symptoms come upon one intuitively, and are irresistible. Supposing that Mr Towser had been accused of having committed a murder about the same hour when his dog was seen at the door of the Bridgewater, scarcely any one, out of all who had seen the animal there, could have hesitated to swear an alibi in his favour. It is possible they might have been wrong. Pyramus was so when he accepted the veil of Thisbe as a proof that she had been devoured by the lion. But the readiness with which people act on such hints is a powerful proof of the aptitude to receive and make inferences from them.

The human figure is at an average five and a half feet. Now, supposing that, in a darkened room bordering on some well-frequented thoroughfare, a tube of certain dimensions were so arranged as to allow of our only commanding the lowermost six inches, or one-eleventh, of the persons of all who passed. We aver that, in such circumstances, it would be possible to know a very great deal of the general figure and character of those who might pass in review. It would not be merely the old story of guessing a Hercules from a large foot, but much of the general condition of individuals might be predicated from that small portion of the figure. For example, if you saw a pair of feet come up, ensconced within a very nicely made and nicely brushed pair of boots, with deep tapering heels, pointed toes, and blue trousers with braided seams, neatly cut and strapped so as to apply very exactly to the boots, you could entertain no doubt that the owner of these said feet was some officer of the dragoon regiment lying in the barracks, an indefatigable forenoon promenader, a haunter of all possible balls, and a decided lady-killer. Suppose you next observed a pair, sunk in loose-mouthed shoes tied with thongs, and connected with a pair of thin legs, wearing black worsted stockings, and of which even the four inches exposed to view manifest an inclination forwards of at least ten degrees, you could not doubt that you saw the basement of an old man who acts in some such capacity as that of verger, or a winder-up of city clocks, or a recorder of mortality, and the rest of whose habiliments consist of a rusty black coat of antique wideness of sweep, a deep vest, and a pair of equally black and rusty nondescripts, tied with black worsted tape at the knee. Suddenly come upon you a pair of something in white silk stockings and pale-coloured jane boots, with a very small vision of ankle above, and then the bottom of a silk pelisse: you know in a moment from the twitter of those pretty feet, their cut and dress, and the light yet firm hold which they take of the ground, that the owner is a decidedly smart young lady, whom the officer before mentioned surveyed very critically a minute ago as he passed, and whom he intends to have another peep of, by turning round at the end of the street, and meeting her on his return. What varieties of people there are in the world! The next pair of feet exhibit dimly blacked shoes, black spatterdashes, and the bottom of a pair of unstrapped rusty black trousers: reader, do you require to be told that this is the modest-looking man who acts as a private tutor three doors off? Next come a pair of stumping boots, very much splashed, evidently not made by Hoby, thick in sole and low in heel, having strapped spurs attached, and a considerable many folds about the ankles: your seeing the remaining ten-elevenths of this man could not more effectually assure you of an honest farmer who has just ridden in from the country to attend market. The boots stop and give a turn round: the man is looking for some shop, where he was commissioned to buy something by his wife or daughters. A pair of large light-coloured snow-boots, which next succeed (the season *not* being winter), and which come heavily but not slowly marching along, with a skirt of bombazetto or some such stuff sweeping round them, is detected in an instant as the foundation of a fat

Digitized by Google

old lady, who goes to market with a basket on her arm to buy her own eggs and butter. Then we may perhaps have presented to us two huge pediments, with heavy soiled shoes, and corduroy spatterdashes, the thongs of the shoes being drawn through pie-holes in the spatterdashes, and then tied down above them; this, you know in a moment, is Saunders Bathgate, the Pennycuick carrier, newly arrived in town with his cart, and now engaged in delivering orders "for goods" on behalf of his many country customers. Your mind comprehends the whole man, the integer Saunders, as readily and clearly as if you met him face to face on the plainstones. If six inches of man can signify so much, much more will six inches of child, for there the proportion of the part to the whole is in favour of the observer. See here come a pair of little sturdy shoed feet, with very short thread stockings above the shoes, and above that again pieces of thick red fleshy legs which the stockings have evidently great difficulty in clasping or keeping up upon; you need to see no more in order to be aware that this is a stout well-built little gentleman of three years and a half, with the port and dress of a miniature beef-eater, taking a forenoon walk with his nurse, and excessively troublesome on the subject of guns at all the toy-shop windows, although he has a ball in one hand already, and draws a horse behind him with the other. It were needless to enumerate more figures. The above must form a convincing proof of how little in many instances the eye requires to see, to enable the understanding to vaticinate on all that remains.

These speculations are not altogether mere whim or drollery. They point to some practical good lessons. In the social world, points as minute in dress and bearing as any of those above adverted to, have their effect in giving a general impression of individuals. A piece of attire out of taste in its colour or form, a slight uncouthness of pronunciation or address, even so small a matter as a careless or over-familiar attitude, particularly in sitting—all of these little matters, and many others, tell upon men of the world, and also upon women, as indications of the whole man, and may be decisive of much that is for his disadvantage. Great and constant vigilance is accordingly necessary, in those who do not stand quite independently in the world, for the detection and suppression of all such peculiarities.

POPULAR INFORMATION ON POLITICAL ECONOMY.

THIRD ARTICLE—CAPITAL.

CAPITAL has been defined as "accumulated labour." This, to a certain extent, explains what capital is composed of, but it is not a full definition of the word. There cannot be capital which is not created by the accumulation of labour, but all accumulated labour is not capital. To make any article constitute capital, it must be capable of being employed in satisfying the wants of mankind, either by its being itself adapted to those wants, or by its being the means of bringing into existence those things which are so. It must, in fact, be an useful commodity. It is not sufficient, however, that it be something merely useful to the individual who has it; the root which the savage takes out of the earth and eats, is not capital in any form. It must be something that has utility, and, consequently, value, with reference to individuals besides the possessor. Thus potatoes piled in a granary, whether to be sold, or to be employed by the farmer in feeding the workmen on his farm, are to a certain extent capital. The extent to which an article possesses the qualities of capital is not measured by the pains bestowed on it, or the difficulty of its acquisition. It is not measured, in short, by its cost. A thousand pounds may be spent in labour, the result of which shall not be sixpence worth of capital—say, in building a monument on the top of a hill. A calculation was lately made (whether it be correct or not, is little to the point), to the effect that the Great Pyramid of Gizeh must have cost about as much (that is, occasioned about as much labour) as the Liverpool and Manchester railway. Here we have two specimens of accumulated labour. The former, however interesting it may be as a study, and thence valuable to mankind at large, is, like any of the works of nature, not worth sixpence in the commercial world, while the latter constitutes a capital far more valuable in the aggregate than the various individual portions of labour of which it is constituted.

There is an important quality which must distinguish accumulated labour before it can be called capital; it must be of such a nature that people will give something for it on account of its utility in a commercial point of view—in other words, on account of its value. The commodity which of all others in existence is most purely of the nature of capital, is money; and so strongly is this felt, that, in the estimation of some, it is the only commodity which should be called capital. This, however, is decidedly a fallacy, for even if money were the criterion of capital, certainly whatever will bring money is in the same position. Thus, railways, roads, piers, docks, and other public works, the stock of which is saleable, are in every respect capital. Public works, however, which the sovereign of a state has made for the general and unrestricted use of the people, however useful they may be, are not capital. A pier at which every vessel is allowed to touch, and by which no individual makes money, is no more capital than a good natural roadstead, or a fair wind, is. If the wind could be taken possession of and let out to hire, it might be converted into capital.

In the opinion of some, manufactories and other works, which are capital put into operation, cease to be, strictly speaking, capital, except to the extent to which they are saleable. It is evident, however, that such establishments, if they are successful, are producing the best effects of capital; and it might perhaps tend better to a clear understanding of the subject, to make a distinction between available and invested capital. Thus, money, and any thing that will bring money, is available capital. An establishment of warehouses and machinery, of which the owner makes profit, but which no other person would take off his hands, is invested capital. A manufactory will in many instances be a mixture of both. It will often happen, that in the hands of the person who has planned and organised it, it is worth more than it would be in any other person's, and that, consequently, no other man will give so much for it as it is worth to the owner. To the amount that it will fetch in the market, it is available capital. The remainder of its value—that is, of its value to the owner—is invested capital. If the owner of an establishment which no other person will give any thing for ceases to make use of it, it is no longer capital either available or invested, and it becomes, like the Pyramids, an old ruin, or any other object that cannot be applied to commercial purposes—a mere portion of the crust of the earth.

Let us now look to the benefits conferred by the accumulation of labour, when it possesses the qualities of capital. It is the great engine by which the useful energies of the human race are concentrated and directed. It keeps the results of industry piled up and accumulated, to await the moment when it can be most advantageously put forth, as Napoleon concentrated his forces, that their united efforts might bear on one selected point. Every convenience which the citizen of a civilised country has at his hand, is the result of this accumulated labour. The savage, when he wants warm clothing for winter, has to hunt down a wild beast, and to prepare the skin for its destined purpose. The inhabitant of one of our large cities can procure, by stepping to a shop in an adjoining street, a similar piece of fur, which the silent operation of capital has caused to be stripped from some animal in a frozen wilderness thousands of miles distant, and to be adjusted, as if by some miraculous anticipation, to his most fastidious taste.

Like many other unintentional benefactors of the human race, the capitalist has been the subject of much ignorant abuse. Undoubtedly his aim, like that of most other men, is generally self-interest. It is because it returns a profit to himself, not because it gives the consumer a cheaper article and feeds the workman, that he puts his money out to use, but the service done is not the less because he profits by it as well as others. In those communities which swarm with idle able-bodied men, and where the introduction of capital is of service the most signal, the opposition to the monied man is generally the most bitter—witness the attempts which were made in the earlier part of the last century to introduce an enlarged system of farming into the Highlands, and the later efforts that have been made to settle manufactures in some parts of Ireland. The more numerously human beings are congregated together, the more powerfully benignant is the influence of capital; and when Ireland shall freely embrace the sometimes overflowing resources of England, it is impossible to anticipate the amount of felicity and prosperity which such a change might bring to that hitherto unhappy land. But we must not throw on the ignorant and needy the sole odium of the prejudices against the capitalist. Such is the natural jealousy which man feels towards the neighbour who shares advantages with him, that we find this feeling lurking in the most enlightened quarters. Authors, for instance, are peculiarly subject to it. Their complaints against the booksellers are of notorious recurrence; and some of them are classical, from the bitter genius with which they are pointed. Yet were it not that the bookseller can exercise his capital upon them, many of the noblest works of genius would never see the light, and few authors would be rewarded for their toils. It is true that the bookseller, whatever appreciation he may have of the genius or merits of the author, will give nothing for a work unless he expects to make the usual profit by his outlay; but this is no more than saying that he is not a disinterested benefactor of genius, who has resolved to bestow his money on a portion of his fellow-men. Booksellers, like other capitalists, and like other men of all professions that have not something degrading in their nature, are average men, actuated by the same motives, whether tending to selfishness or generosity, as their neighbours; perhaps, indeed, from the nature of their pursuits, and the class of persons they come in contact with, they may be rated a degree higher in point of liberality and good feeling than the average of traders. But this is a digression.

Much has been said of the advantages which the world has derived from the division of labour, a subject which may be noticed on some future occasion. This system never could be carried to any considerable extent without capital, and the more abundant the capital, the more does the community profit by this beneficial arrangement. Adam Smith has given a beautiful illustration of the division of labour, in the preparation of so petty an article of commerce as a pin. He found that ten persons could make 48,000 pins in a day when their labour was divided, whereas, had they been working singly, "they certainly could not each of them have made twenty, perhaps not one pin, in a day." If we withdraw the existence of capital entirely from the pin-maker, we will find the "not one pin in a day" fully realised. We must not, in such a supposition, presume that the operative has brass wire, or even wrought brass, in his possession, for these are created by capital. If he wants to make a pin, we must set him in search of copper ore, which he has to smelt and amalgamate with zinc, that he may have brass to make his pin with. This is putting a case which probably never occurred, but it may serve as an illustration. The individual would hardly perhaps (supposing him even to live in a place where copper is found) make his pin in a week. By Adam Smith's estimate, each individual of the ten must be considered as making 4800 pins per day. Even this number, however, would, it appears, be increased by a more liberal employment of capital than that which took place in the instance alluded to by him. "I have seen," he says, "a small manufactory of this kind where ten men only were employed, and where some of them, consequently, performed two or three distinct operations. But though they were very poor, and therefore but indifferently accommodated with the necessary machinery, they could, when they exerted themselves, make among them about twelve pounds of pins in a day." It is very evident from this, that an increase of capital would in such a case increase the proportional results.

Want of capital is the chief evil which poor communities industriously inclined have to combat with. The long and steady industry of Great Britain, coupled with the absence of internal convulsions and foreign invasion, have given us a greater amount of this accumulated labour than perhaps all the rest of the world put together. It is by this that we preserve our manufacturing and commercial superiority in spite of many advantages on the part of other nations, which might at first sight appear of superior importance. The cotton we use grows in India, but there is no accumulated labour there to be concentrated in its manufacture in the form of the steam-engine and the spinning-jenny; and so, with the disadvantage of being ten thousand miles from the place of its growth, we can manufacture it, and send it back in the form of clothing to the agriculturist who produced it. Again, when there is a sudden demand in some distant country for a commodity which is produced in a neighbouring land, neither of the two states perhaps has capital enough to convey the article from the place where it is a superfluity, to that where it is wanted, until the accumulated labour of Britain, lying by for a profitable use, accomplishes the exchange. In modern warfare, capital is a powerful auxiliary, and nothing but our vast command of it could have supported us through our later struggles. To naval warfare, in which we are so pre-eminent, it is essential. An army may support itself by rapine; it may be merely a collection of human beings let loose to shift for themselves. A navy, however, must be a set of vast machines, which capital alone can create; and until some other country can rival us in this quality, none will be able to meet us on the sea. The extent to which luxuries, or artificial wants, pervade the great body of the people, is one of the most marked outward indications of the existence of capital. It is thus a somewhat singular inversion of ancient notions, that the nation which possesses the greatest quantity of luxuries is likely to be the most successful in war.

The peculiarity of the capitalist, if we compare him with the simple operative or non-capitalist, is, that he can wait for the returns of the industry which is going on under his auspices. The operative works for daily bread, and cannot wait for a market. The capitalist concentrates the fruits of the workman's industry, until they are put in the most advantageous state for being disposed of. Take a piece of printed calico as an illustration. The sailor brings the cotton over the Atlantic; the carter and bargeman take it to Manchester; the carder, spinner, weaver, and printer, with many other operatives, are all successively employed on it, ere it has reached the final purpose for which the cotton was grown. It has lain for weeks on the counter of the retail merchant, and has perhaps been worn as many more before the labour expended on it has been finally paid for; yet the various operatives engaged in preparing it, have, through the instrumen-

Digitized by Google

tality of the different kinds of capital applied to the manufacture, been paid their wages, some of them months, others years, perhaps, before the final return has been so obtained.

It is not unnatural that the artisan, who sees that his employer never personally touches the manufacture through which he makes his fortune, should conceive that he is himself the sole fabricator of the commodity, and alone deserving of the remuneration. The artisan too frequently considers himself the only person concerned in the creation of that which his hands have made; and as such fallacies have generally their counterparts, the capitalist perhaps occasionally thinks that he is the creator of those riches, of which he is but incidentally the depositary. There are, in truth, no two classes whose interests are more mutually dependent. That the capitalist could not make his large profits without the industrious and intelligent labourer, is self-evident. That the labourer would be poorly off without the stimulant which the capitalist supplies, a little reflection will perhaps make fully as clear. It is quite true that the capitalist does not work in proportion with the artisan for what he makes; yet, if he should cease to make his profits, the artisan would suffer; and it is poor consolation to a starving family to reflect that the rich man is not increasing his store. If it should come to a question between the capitalists and the operatives of this country, which could most easily cast aside the other, the advantage would lie with the former. There are few places in which capital cannot be put out to use; there are not many in which industry alone can find a market: Labourers cannot easily leave their country in large bodies; but a slip of paper may be the means of transferring to another country as much capital as would employ thousands of them.

FALCONRY.

Falconry was the favourite field-sport of the middle ages, as shooting with the gun is the predominant one of the present day. It appears, in this country, to have declined and gone out of use in the seventeenth century, in consequence of the gun having then become, by the addition of the lock and flint, a much more ready means of bringing down game than the use of hawks had ever been. Falconry, while it existed, was the peculiar sport of kings, and princes, and nobles, many of whom were painted in life with their hawks seated on their wrist, and were sculptured on their tombs after death with the same creature placed at their feet, thus marking the special regard in which they held the animal which was the means of giving them so much amusement. All over Europe, and far into Asia, the sport may be said to have flourished, from the latter years of the Roman empire downwards; and amongst the earliest books of an instructive kind which found their way into print in most civilised countries, were books descriptive of falconry, and containing directions for those who would practise it with success. Circumstances connected with hawks and hawking, the modes of the sport itself, and the technical terms employed in it, were introduced largely into literature and into the ordinary language of the people, as we shall more particularly show in a subsequent part of this paper.

The sport, we need scarcely remark, was founded on the natural instinct of the rapacious order of the feathered creation, as the chase may be said to be founded on the instinct of the dog to pursue the hare, fox, and other animals. The rapacious order of birds, of which the eagle, falcon, and owl, are the three principal types, are formed in such a way as evidently fits them for pursuing, seizing, and destroying the smaller birds; a part in creation which at first sight appears to involve much cruelty, but which has been clearly shown to be intended to save rather than to produce pain, and to be indispensable to a system of things in which one leading feature is, that there shall always be as many living creatures as can possibly be supported.* The falcon family were alone employed for purposes of sport, as alone possessing the required docility, and of this family two or three species were more frequently used than any other. Of those possessing long wings, the falcon proper and the ger-falcon; and of the short-winged, the goshawk and sparrow-hawk; seem to have been the favourite kinds. Species called the hobby, the kestral, the merlin, and buzzard, were the next in request. The female, which is in all the varieties of this tribe considerably larger than the male, was alone employed in sport, and the common names of all the species apply to that sex, the male having usually some distinctive appellation: thus the male of the ger-falcon was called the *jerkin*, of the falcon proper the *tiercs gentle*, of the goshawk the *tiercel*, and of the sparrow-hawk the *musket*.

* See the ingenious reasonings on this subject in Buckland's Bridgewater Treatise.

These birds naturally choose retired habitations. The falcon, in particular, builds her nest amongst cliffs in wild and unpeopled regions. In order to fit birds for the sport of falconry, it was necessary to take them from the nest at a very early stage of their existence (then technically called *eyases*), or to ensnare them in their more mature age, and then train them for the purpose. A falcon in its natural state was said to be a *haggard;* hence, apparently, the term by which we still express a wild or agitated aspect. The first step in training the falcon, was to *man* it, or accustom it to the presence of human beings. Feeding was the grand source of the power which its keeper acquired over it. When it did as required, it was fed, and thus taught to know that it had done right—and not otherwise. If extremely refractory, a stream of cold water was directed at its head, as an admonition that nothing was to be gained by such conduct. From the very first, the animal was accoutred with certain paraphernalia, the *names* of which at least must be familiar to most readers. First, its head was covered by a leathern *hood*, fitting close all round, so as to shut up its eyes, and calculated, by a slit behind, to be readily slipped on and off. On the top of the hood there was a tuft of feathers, which usually has a graceful effect in the old pictures representing ladies or gentlemen travelling with their hawks upon their wrist. Leathern straps, called *jesses*, a few inches in length, were fitted to the legs of the bird by a button slipping through a slit or loop. Close beside the end attached to each leg, was a small spherical *bell*, like those of a child's rattle, and composed of silver for clearness of sound, the one being in some nice instances made a semitone higher than the other. The other ends of the jesses were furnished each with a ring, which could be readily fitted upon the swivel designed to connect them both with the *leash*, a long slender strap, sometimes prolonged by a *creance* or common cord, and designed as a tether by which to restrain the animal, at the same time that it should be allowed considerable room for free motion. Two great objects in training were to teach the bird to fly at its proper game, and to habituate it to come back to the hand of its master, after on any occasion having been let free in pursuit of its prey. For the first of these ends, in the case of long-winged birds, an implement termed the *lure* was used. It consisted either of a stick or of a cord, on the end of which were fixed pieces of flesh, with a bunch of the feathers of the prey which it was designed that the bird should fly at, or perhaps an actual resemblance of the prey in its entire form. The falcon being set loose by one man, another stood at a distance waving the lure around his head, thus tempting the animal to advance and strike at it. A whistle was the implement used to *reclaim* or bring back the hawk. When a hawk was to be kept on the hand, strong gloves were worn for protection from its talons. It may here be remarked, that the training of falcons was altogether a most laborious business, and that trained birds were accordingly to be only purchased at a high price. At the beginning of the seventeenth century, a trained goshawk and tiercel brought one hundred marks, and it was considered a favour to part with them. The extreme labour attending the training of the animals must have been sufficient in early times to confine the sport to persons of birth and fortune, if there were no other cause, and it must also have conduced to the rapid decline and extinction of the sport, after a ready means of killing wild-fowl by the gun became attainable.

The sport, after being long given up, was revived in England a few years ago by Colonel Thornton, the Duke of St Albans, and a few other gentlemen, chiefly through the influence of a taste for whatever is elegant and romantic in the usages of our forefathers. It is said to be a gallant and goodly sight, when a train of well-mounted English gentlemen and ladies ride forth on a clear sunshiny day, to pursue this sport, attended by their falconers, each with his hawk on his wrist. In the present day, as of yore, various kinds of feathered game are flown at. Heron-hawking is, we believe, in greatest esteem. The heron, as must be generally known, is a large bird in appearance, with a long neck, long legs, and a long sharp bill, being designed to haunt marshes and pools, and feed upon whatever fish it can find therein. It is, however, a light insubstantial bird, with nothing to protect it from enemies but its sharp bill. Herons are gregarious, and the lonely places where they live are called heronries. These explanations will introduce the following account of heron-hawking, from Blaine's Encyclopædia of Rural Sports:—

"The daily visitations of the heron to its feeding places are watched by the falconers, who station themselves to the leeward or down wind of the heronry, so that the heron on its return must fly against the breeze, which gives a great advantage to its enemy. As soon as one is discovered on the return, a cast of falcons is let loose, who, catching sight of the quarry, rise in pursuit. The heron, instinctively aware that its life is at stake, prepares for the fray by disgorging the contents of its stomach to lighten the weight of the body. The coursing falcons ascend the airy vault in spiral gyrations, by which the atmospheric resistance to their flight is lessened. These circlings, it has been observed, have frequently the curious effect of presenting the three birds as flying in different directions; whereas the real intentions of the two hawks are steadily directed to one point, which is that of contact with the heron, whose entire efforts are as steadily engaged in avoiding it. To effect this, the affrighted heron strenuously endeavours to rise above the hawks, who, however, by superior power of wing, commonly succeed in getting the upper station, from which one presently makes its stoop; and happy it is for the poor heron if he can evade the blow, which he occasionally does, either by shifting his station, or by receiving the falcon on his sharp bill, which instantly transfixes it. This danger is, however, denied on authority, but we feel assured that it does occur. The second hawk, if the first fails, stoops in his turn; but the meditated blow of this also is frequently evaded like the former. The trio then still rising higher and higher, the sight becomes interesting in the extreme, and the spectators are scarcely less agitated than the feathered warriors above. At length another stoop takes place, and the fatal seizure is made by one hawk, while the other *binds* to his fellow, and all three quickly descend together, but not with a dangerous rapidity, as their powers of inflation and the action of their wings break the fall. It is now that the mounted horsemen make the best of their way to the assistance of their falcons, and their first efforts must be directed to secure the head of the heron, that the sharp beak may not take effect on one or both of them."

Pheasants are objects of this sport, but not to a great extent, on account of the inconvenience presented by the sylvan ground in which the sport must be practised. Partridge-hawking is found to be a more convenient sport. To quote the same authority—"The scene of practice is commonly on large fields, or open tracts of country, where the horsemen and company generally can beat in line, and the attendant falconer or master, being well mounted, can ride forward, and be ready to receive the quarry. Either pointers or spaniels are necessary, or both. Sir John Sebright says, that high-ranging pointers are the best dogs for the sport, for the birds will often lie to a dog when they will not suffer horsemen to approach them. Neither, provided the hawk used be well broke, is it necessary that it should be very near the dogs when they point, or near the birds when they rise. He also observes, that, if the hawk be within two or three hundred yards, it will be near enough, if her *seat be high* and she directs her view inwards. In case she should not do this, she must be lured by the voice, or constrained into noticing by the lure itself. It is however observed, that it is better that a flight be lost by the hawk ranging too far, than that she should be lowered or confined in her pitch by too much luring. Sufficient time should by all means be allowed to the hawk to mount well before the game is sprung; for being sufficiently elevated, her range of vision will be equal to take in the whole expanse around her, and incline her to watch the moving scene more attentively than if she were nearer.

The partridge being flushed, the hawk will stoop with astonishing rapidity, and seize on it; at which time neither horses, dogs, nor company, should press forward; on the contrary, they should permit the falconer only to advance, who, approaching the hawk with caution, must walk quietly round her, when, gently kneeling down with his arm extended, as though in the act of feeding the hawk, he should lay hold of the partridge, and at the same time place the hawk on his fist. This done, put on the hood, and reward the hawk with the head of the quarry, and if she be not intended to fly again, let her be fed immediately.

A somewhat different method of partridge-hawking is practised in the latter part of the season, when the country is very bare, and when the partridges are often very wild, and lie indifferently even to the dog. In such cases it is recommended that the company 'draw up in line at fifty or sixty yards' distance from each other, and gallop across the plain with a hawk upon wing,' the falconer being in the centre of the line, that he may regulate the pace by the situation of the hawk. Sir John Sebright informs us that this method of partridge-hawking has afforded him more sport than any other, and that when the face of the country was so bare, and the birds so wild, as to make it impossible to approach them in the usual way.

Brook-hawking, as it is often termed, was much in vogue formerly. The practice was not, however, confined to brooks, but extended to rivers, sea-shores, moors, and ponds. It engaged, according to Blome, 'the jer-falcon, the haggard falcon, the jerkin, and the tassel gentle.' Waterfowl of every description were made prey of; but some particular objects, according with the training of the falcons, were particularly sought for. Dogs were employed to rouse the fowl, being led on by men who traversed the water's edge; while horsemen, with the hawks on their fists, were at hand to *cast off* one or more, according to the nature of the game. A heron or mallard would require two, while a widgeon or a teal would probably engage only one.

Blome's description of brook-hawking commences with the following hints on the training of falcons to this sport:—'In many places there are ponds inclosed with woods, bushes, and the like obscurities, so that they are concealed from passengers, and such places ducks do much resort unto: now, for the training up your *hawk* to take them, observe these directions. Your hawk being in all points ready to fly, be provided with two or three live *train ducks*, and let there be a man who must lie concealed in some bush by the pond with them, so that, coming to the place, having your hawk prepared for the sudden flight, beat the

Digitized by Google

bush with your pole, where the man lieth concealed with the ducks, who must cast forth one of them, to the end the hawk may think it was put up by you; and if with a courage she takes it, *reward* her well; and this is the way to train up a goshawk to catch a *fowl* at *sowce*. Having trained your hawk to this, you may boldly go with her to the ponds where the fowl lies, and creeping close to the place, raise them up by beating about with your pole; and when any rise, let go your hawk from your fist, and if she seize it, let her take pleasure thereon, and reward her well. It is very necessary to have a spaniel with you; for if the hawk is well acquainted with the sport, she will be so nimble at the catch, that they will fall into the water together, and by that means the fowl may go to plunge, so that then the spaniel will be ready to do good service, and not displease the hawk. It is when your hawk will fly, jump, and come in at your lure, it is then that she is fit to go to the river in earnest; and to further manage your flight, observe these directions. When you have found where the fowl lies, then go about a quarter of a mile up in the wind to the river side, and whistle off your hawks, loosing their hoods, and let them fly with their heads in the wind, for there must be a cast of hawks for this flight; then let the falconers, or others that are at the sport, strike their poles in the water, to cause the hawks to come in unto you, and own the river; and when they are got up into their places, then let one of the falconers go below the fowl, that is, down the river; and the other that is above, let him come down, and show the fowl again, and by that means the fowl will be crost over land, that the hawks may make a fair stooping; and knocking the fowl on the land, will occasion the killing it, which will quarry your hawks. But if they should miss their stooping, so as the fowl may get to the river again, then your hawks must go to their wings to make good their flight; but if the fowl should go to plunge, then take down your hawks, lest you should fly them too long; and the falconers, with their spears or poles, may endeavour to spear or kill the fowl, which take to quarry the hawks with. If they kill not the fowl at first stooping, give them respite to recover their place; and when they are at their place again, and their heads in, lay out the fowl as before directed, and reward them well if they kill. You should do well to have a live duck in your hawking-bag, that if they kill not the fowl which is stooped (as ofttimes it happens), then your hawks being at their pitch, and their heads in, you may throw to your hawks and reward them; and by this means you shall always keep your hawks in good life and blood, and to be inwards.'"

Laying out of view entirely the partial revival of the sport in modern times, it may be said that falconry is, and must ever remain, a living thing amongst us, in consequence of there being so many references to it in literature, and its terms being so largely received into our common language. Dante, Chaucer, Spencer, and Shakspeare, to say nothing of many meaner names, abound in allusions to this sport of the noble and princely, and in images derived from the falconer's craft. One of the most affecting stories in Boccaccio is that of the reduced gentleman, who long wooed a lady unsuccessfully, and at length on her visiting him, having no other means of entertaining her, gallantly sacrificed his falcon for her meal, and thereby, though without design, gained her affections. The idea in Othello's exclamation respecting the suspected Desdemona—

> I'll whistle her off, and let her down the wind,
> To prey at fortune—

is taken from the act of setting off the hawk upon her flight.

> What! all my pretty ones—all
> *At one fell swoop?*—

the frantic inquiry of Macduff—is from the act of the bird itself in descending upon its prey. Milton speaks of "imping his wing" to a bolder flight. *Imping* is the technical term for the process of mending a broken feather in the wing of the hawk; the process itself consisting in splicing, as the sailors would say, a new feather to the stump of the old one, with a needle passing through both at the juncture, and holding the two pieces together. Knowing this, the reader will understand Sir Philip Sidney, when he speaks in his sonnets in praise of Edward IV:

> Not for his fair outside, nor well-lined brain,
> Although less gifts *imp feathers oft on Fame.*

"Hood-winked," a familiar phrase for one who walks in any kind of mental darkness, is from the practice of keeping hawks hooded till they were ready to fly. We speak of "flying at higher game," from a traditionary notion of hawking. The term hawker, expressive of a travelling merchant or pedlar, is probably derived from the old custom of carrying about hawks for sale. These men carried the birds upon a frame slung from their shoulders, and termed a cadge: hence *cadger*, another but comparatively local term for an itinerant dealer. Most curious of all is the term *musket*, which seems to have been derived from the technical name for the male sparrow-hawk, on the same principle which was followed in calling pieces of ordnance in the sixteenth century by such names as the Great Falcon, Thrawn-mou'ed Meg, and so forth. Another strange memorial of falconry is found in the term, now common in our large cities, for a lane of stables running behind a street. The birds employed in the sport annually *mewed*, or changed their feathers. The place where the birds retained by the English monarch were put on those occasions, near his palace, was called the King's Mews. The buildings for the hawks were in time supplanted by stables for the royal stud, but still the name of King's Mews or Meuse was retained. This has in time spread to stable-lanes, as already mentioned, all over the kingdom.

SANATORIUMS.

The term Sanatorium, which is nearly synonymous with the French *Maison de Santé*, or House of Health, has been suggested as the title for an Hospital-Establishment of a peculiar order, lately proposed to be set on foot in London. The objects of this institution seem to us of so commendable a character as to claim some notice at our hands, and we give it with the greater willingness, as our pages are more particularly addressed to the very classes of society chiefly interested in the subject, and may be the means of calling their attention to it more readily and extensively.

The Sanatorium is intended to be, in some measure, a private hospital, calculated for the benefit of many individuals of the middle and lower classes of society, who, when labouring under disease, are unwilling to resort for relief to an ordinary medical charity, yet are not so circumstanced as to be able to pay for medicines, and to procure the attendance of physicians and nurses at home—at least, in a manner suitable to their ailments. In short, the proposal is, to give to every such person, through the advantages of *combination*, the amplest and best means of relief under bodily distress, at the lowest possible rate of cost, without rendering them debtors to public charity, as in the case of common hospitals. It appears to us that there is a large section of society, which establishments of this order are calculated to benefit extensively and lastingly. Mechanics and working men of every description, and all who fill the humbler departments in offices, shops, and warehouses—especially where they are unmarried and live in lodgings—together with all domestic servants of the more respectable class, who usually are compelled to leave their places of service when attacked by serious diseases—these, and many similarly situated parties, must be again and again thrown into the deepest distress by the want of such institutions as the one now proposed. On the other hand, there is an equally large class of individuals, not residing in cities, to whom such institutions would also be of the highest benefit. There are numerous persons, in rural situations, afflicted with diseases of a chronic kind, such as old ulcers, eruptions, tumours, and the like, who might be relieved by the superior medical advice to be got in cities, but who cannot make up their minds to enter a common hospital as objects of charity, or to risk the expense attending a residence in private lodgings under the charge of proper nurses and proper medical attendants. They are in decent enough circumstances to shrink from the first of these alternatives, yet too poor to venture on the second step. Small farmers, and respectable tradesmen, with their wives and families, as well as servants and others who have laid up a little money, are the parties usually placed in this dilemma, and whose comfort in life is too often impaired in consequence. Their existence itself is in many cases shortened by the same cause. To these persons the Sanatorium would be an institution of the highest value. They would there enjoy, for the least possible cost, the best possible tendance and advice, and would neither, on the one hand, have their honest pride hurt by the sense of accepting eleemosynary relief, nor be alarmed, on the other, by fears of incurring debt, or draining the scanty resources of their families for a personal end.

So much for the principle of the Sanatorium, which seems much the same as that which leads gentlemen to form club-houses; union lessening cost to individuals. Sanatory institutions, based on this leading principle, appear to us likely to do much good in every great seat of population. The details of the plan may differ in different places, and will do so, it is probable, if the idea be adopted to any great extent. The following are the leading features in the scheme of the London Sanatorium, projected, we believe, by Dr Southwood Smith, a gentleman who has won an honourable reputation by his excellent work on human physiology. A payment of about two guineas a-week made by each patient, insures to him bed, board, and medicine; the attendance of skilful physicians and nurses; the use of a separate room if requisite; with baths, quiet, pure air, and all the curative means and appliances which science has provided in aid of medicine. To collect a fund of L.3000 wherewith to commence operations, life-subscriptions, of ten guineas each, and yearly subscriptions of one guinea, have been proposed and opened, the subscribers in such cases being privileged not only to share the advantages of the institution at a *lower rate* of cost, but to recommend non-subscribers as inmates. It is only a few months since the idea of the institution was first started, but the subscriptions, and particularly the annual ones of a guinea, are already numerous, and there is every prospect of the requisite sum being soon made up, and the building got ready. As for medical attendance, it seems to be arranged that one resident medical officer shall take the general charge of the house, assisted by others who are to act as visiting physicians.

We trust that this establishment will go on and prosper. But we have now to present a claim for the Scottish capital, as having had the merit of leading the way in this particular path of sanatory policy. In 1837, a private hospital was opened at Minto House, Argyle Square, Edinburgh, the leading principle of which is identical with that of the London Sanatorium, as will appear from the words of the original Report. "It is intended for the benefit of a numerous class of individuals, who, when labouring under disease, are unwilling to be considered objects of charity, and to enter a public hospital. It must frequently happen that housekeepers, servants, and lodgers, when affected with ill health, cannot, in their peculiar circumstances, obtain all the attention and comfort they require. In many cases it is particularly inconvenient for the masters or friends with whom they reside, to afford them suitable accommodation, professional attendance, medicines, and nursing; and to them, therefore, the advantage of a maison de santé, to which recourse may be had, must be apparent. In such an institution the patients enjoy the seclusion of a home; and as something is paid for the services of which they stand in need, the feelings which would arise from being treated entirely as objects of charity are removed." The same Report then points out several of the advantages likely to accrue to country patients from such an institution, with other circumstances rendering it worthy of public notice; and mentions that the charge for board, lodging, medical attendance, and nursing, was to vary from 10s. to 20s. per week.

Three regular medical officers, Drs Peddie, Brown, and Cornwall, aided by the valuable services of Professor Syme, in the capacity of consulting surgeon, took the management of this private hospital. Minto House, where it was commenced, had formerly been a surgical hospital, and is a building of no great extent, yet airy and commodious. As the originators did not possess the advantage of large subscriptions to establish their Sanatorium on a very extensive scale, the number of patients received and treated by them has not been, on an average, above fifty or sixty annually. This may seem a comparatively limited amount of practice, but it must be remembered that only eight or nine patients can be received into the house at one time, and that many of them, being afflicted with diseases of long standing, occupy the rooms for a considerable period. With regard to the description of persons thus relieved, we are told that they consisted of the class for whose benefit "the institution was principally intended, such as strangers from the country, individuals in reduced circumstances, clerks, shopmen, the upper class of servants, &c. Of the cases coming under treatment, many have been highly important and interesting in a medical point of view, and several requiring the performance of severe surgical operations." The Report for last year also states that "patients have lately come from great distances, and that the hospital has met with countenance from families in the higher circles in town, from commercial houses in which boarders are kept, and from hotel and lodging-house keepers, who have placed under our care valued servants and others." The medical managers conclude, from their past experience, that, as the institution becomes more widely known, the number of admissions will progressively increase.

It is but just, therefore, to the gentlemen now mentioned—who have for three years sustained this Sanatorium by gratuitous labours of no common extent, as well as kept up a large out-of-door and dispensary practice, by which no fewer than 5611 poor persons were relieved during last year—to state that they have the merit of having given a fair trial to the scheme now about to be carried into operation in London. It is true that the trial has been made on a comparatively small scale, yet the public have it in their power, by increased support, to extend the advantages and sphere of usefulness of the institution. It is excellent as far as it goes, and has nurses, medical attendants, and other conveniences suitable for its extent; the patients are treated as if they were in their several homes, and, according to their wishes and means, are provided with single rooms, or have the comfort (which most of them are found to like) of the company of others of their own sex during their confinement; scales of comfortable diet are arranged for them, in accordance with their wants and their maladies; and, in short, the establishment is conducted with great liberality, judgment, and care. But Edinburgh and its neighbourhood, if fully alive to the advantages of such an institution, would support its managers more generously, and enable them to work on a scale of increased utility. This might be done, to a certain extent, by patients themselves taking advantage of the opportunities which the institution, as it is, affords; but if the public were to come forward at the annual meetings of the supporters of the dispensary and general establishment of Minto House, and to strengthen the hands of its managers by their support, something still more worthy of the capital of Scotland, in the shape of a Sanatorium, might be

Digitized by Google

the result. Who can say that he may not, ere many years pass over his head, require the services of such an institution! It is to those, certainly, who know not the comforts of a family circle, and of friends around them, that a Sanatorium seems to hold out direct prospects of advantage; but those who possess these blessings may one day have them not, and may be glad to have that substitutive help in distress, which the establishments under consideration are so well calculated to afford.

AN INCIDENT IN THE CAREER OF A COMMERCIAL TRAVELLER.

In Egypt, at the present day, and in various other eastern countries recently opened up by the increase of steam-navigation, an assimilation is rapidly taking place between the customs of the west and the east. In past times these have remained almost entirely isolated and distinct, the intercourse between the different climes not being of such a nature as to cause an amalgamation between their habitudes, at least to any great extent. But, now-a-days, commercial travellers pass as regularly between London and Alexandria as between London and Hamburgh, or Glasgow and Manchester; and the consequence is, that fashions and manufactures are flowing from the west into the east in great abundance and with great rapidity, promising soon to create new and powerful ties between regions and races hitherto really little known to one another. The end of all this cannot but be for good; but long-existing prejudices cause this incipient intercourse to be sometimes attended by a degree of effervescence, such as accompanies the union of different chemical elements. From inattention to the peculiar prepossessions of their oriental customers, commercial men from Europe, and especially those of a bustling and officious order, frequently get themselves into odd scrapes, and scrapes not unattended with danger.

A traveller from Paris, named Bonnard, a brisk stirring fellow, who rejoiced in the office of agent for a distinguished depôt of male and female fashions in dress, conveyed himself not long since to Alexandria, with a large assortment of rich articles of attire, which he proposed to dispose of to the lords and ladies of Egypt, but more particularly to the ladies. Through dint of activity and perseverance, he was successful beyond his hopes. The Mussulman aristocracy are eminently *accessible*. The meanest water-carrier of the Alexandrian streets may present himself to Mehemet Ali in person, and make a verbal appeal, or deliver a petition, just as used to be the case in the days of Haroun Alraschid. The eastern nobility imitate this regal fashion; and hence Bonnard, while in Alexandria, found it not very difficult to obtain a hearing from the great men of the city, and to lay before them specimens of his rich goods, which led to extensive purchases by these pachas and beys, for the decoration of the invisible ladies of their respective households.

On moving from Alexandria to Cairo, Bonnard learnt that in the latter city there resided a certain Abdallah-Pacha, a wealthy and powerful lord, who had recently married a most beautiful lady, and one of whom he was devotedly fond. Bonnard immediately resolved to make prize of Abdallah-Pacha, and found no difficulty, accordingly, in making his way into the presence of the eastern grandee. He found Abdallah sitting in luxurious ease upon a divan, alone, in a large saloon, and smoking with most oriental languor and enjoyment. Servants were present, but not a whisper or footfall could be heard. All were dumbly attentive to the looks and signs that came, or might come, from their master, who was a man in the prime of life, with finely cut features and head, a long beard of glossy black, and eyes that sparkled like carbuncles. The contrast between this grave, awe-striking personage, and the dapper lively mortal who now intruded on his luxurious repose, was most remarkable, as regarded appearance, and every other point. Bonnard was a thorough Frenchman, firmly impressed with the belief that all that was done at Paris was right, and that all that was done elsewhere, if done differently, must be and was indisputably wrong. He dressed precisely in the manner of the lay figures adorning his own depôt, or the pages of the "Journals of the Fashions," which he carried about with him in the exercise of his calling. Such was the person, curled, essenced, strapped, and starched, in the newest Parisian mode, who now approached Abdallah with the same graceful unembarrassed sidle which he might have displayed in accosting an old college chum. Scarcely waiting for the permissory nod of the master of the house, Bonnard, withdrawing his hat from its elegant position in front of his breast, sat down on the divan, close by Abdallah's side. The Egyptian looked on him with much the same feelings as those with which a noble stag-hound might be expected to regard the approach of a lady's lap-dog; namely, with a sort of grave and lordly surprise, but without displeasure. Indeed, it is known that the orientals feel the easy address of Europeans as a relief, when compared with their own formal and tedious salutations. Such were the circumstances attending the meeting of the powerful Mussulman with the Parisian fancy-agent.

Bonnard was no sooner seated, than he rubbed his hands, and unfolded his sample-stores, eager for a customer. By the help of a little smattering of Turkish and Arabic, in addition to his fluent French, which is partly understood in Egypt, Bonnard could make himself pretty intelligible. He started in praise of his stock of goods; Abdallah nodded. The traveller spoke more; still Abdallah nodded. But Bonnard was anxious to bring things to a bearing, and, remembering only his Parisian politeness, he got out with the words—intended to call an important personage to the mind of the Egyptian, and so to stimulate to a purchase, "And how does madame?—your lady?"

The words, simple as they were, acted like an electric shock on Abdallah-Pacha. His lately calm countenance was instantly flushed with passion, and then distorted by its subsequent workings. His hands grasped the cushions of the divan as if he would rend them in pieces, and he commenced to pour forth a torrent of objurgations, few of which were intelligible to Bonnard, though he could not mistake their general tenor and meaning. Yet, though he grew pale, the Frenchman preserved his unchangeable, indestructible smile. When Abdallah seemed to have nearly exhausted himself, Bonnard observed, with a tone in which only a slight falter was apparent, "I have unintentionally said something wrong."

"To ask me 'how does my wife?' By the beard of the prophet," said the still boiling Abdallah, "if I did not respect the claims of hospitality! How come *you* to know my wife? Unless you had acquaintance with her, you would not ask for her."

"Pardon me, my lord," said Bonnard; "it is the custom of my country."

"It is a monstrous and offensive custom," said Abdallah. The little Frenchman faltered, and simpered, and bowed, and explained; but all would not do. He had touched on the tender point in the eastern's jealous nature; and although his inquiry would have been held as one but of common courtesy in the west, it had the effect, particularly as coming from the lips of a stranger, of jarring on all the prejudices, both national and personal, of Abdallah-Pacha. Still the latter was not an illiberal man in his way; and becoming partly convinced, perhaps, that he had made a mistake, he contented himself by dismissing Bonnard for the time only. "I cannot examine any thing to-day," said he, passing his hand over his yet ruffled brow; "come back to-morrow. Farewell."

This sounded as a peremptory order for departure, and Bonnard obeyed it. As he left the house, however, he accidentally met with a female, whom he recognised as a Maltese, a person who was employed in retailing articles of dress about the households of Cairo. Anxious to get off his stock, it struck the Parisian that it would be a good scheme to give this woman one of his "Journals of the Fashions," that she might place it in the hands of Abdallah's beautiful lady. The thing was easily managed. A slight douceur being laid upon her palm, the Maltese took upon her at once the proposed commission.

Little did poor Bonnard imagine, as he moved off with renovated spirits to his place of lodgement—confident that the sight of the magnificent figures adorning his Journal must tempt Abdallah's lady into an order of immense magnitude—little thought the dapper Parisian that he had prepared the way for the outburst of a storm, likely to involve not only himself, but others also, in ruin and destruction! Abdallah, after smoking himself into something like composure, went to the apartments of his beautiful spouse, whom he really loved tenderly. She was seated with her damsels, busily engaged in discussing the mysteries of the toilette. Abdallah approached. His eye lighted on a book, covered with splendid figures. He snatched it up, and turned over the leaves. One figure arrested his attention, and in an instant his brow became again black with the passionate blood of the east. Unlucky Bonnard! In the Journal given to the Maltese, there was one portraiture of the "masculine form divine." It was the one by which Bonnard dressed himself. In every particular he copied this great original, from the cut of the collar to the boot-straps. It is well known that these model-figures are like every body and like nobody; or, in other words, as like one man as they are like another; but it chanced that this particular figure was very like Bonnard, as regarded colour of hair, complexion, and every other point, as well as in the dress. Abdallah-Pacha gazed at it as if he had seen a boa-constrictor in his path. His suspicions were re-awakened, and roused to a boiling torrent. He could not doubt but that the Frenchman had formed an acquaintance with his wife, and had presented her with his *portrait*. It may be guessed what an impression such a belief would make on the fiery and jealous nature of Abdallah. We shall not attempt further to describe it, but will proceed to mention the consequences to which it led. Repulsing his trembling lady, who saw that something was amiss, and who sought to soothe and to explain, Abdallah burst from the apartment where he had found the proof, as he thought it, of his wrongs, and retired to his own chamber to meditate schemes of vengeance.

After a long interval of moody reflection, during which he sat with the hated portrait before him, Abdallah called his blacks, the passive instruments of eastern vengeance. He told them that two victims were to be sacrificed; but when he attempted to name them, he found that the words would not pass his lips. He loved his wife, it has been said, most devotedly, and had hitherto never doubted of her constancy. All that he could say to the blacks was, "To-morrow, I will point out the victims to you!"

Abdallah-Pacha waited restlessly next day for the appearance of Bonnard. The light-hearted little Frenchman was not long in presenting himself. He danced easily and smilingly into the saloon of the eastern lord, little thinking of the fate that hung by a thread over his head, little dreaming of the purpose for which the blacks had taken up their station behind the divan of Abdallah. "I hope," said Bonnard, with a salutation half-western half-oriental, "that I will be fortunate in pleasing my lord to-day. I have brought the richest patterns."

"You have deceived me," replied Abdallah, in a tone of assumed calmness.

"No, upon my honour," returned Bonnard; "all that I offer is of the best quality, and at the lowest price."

"You have wronged me—you have written to my wife," continued the Egyptian, grinding his teeth as if to wear down his passion.

The Frenchman had sense enough to be seriously alarmed at the symptoms presented by the bearing of his interlocutor. "I have never written, seen, or spoken to your lady," cried he earnestly.

"You have sent your portrait to her," continued Abdallah. The Frenchman falteringly exclaimed, "No—never!" Abdallah drew from his breast the Journal of Fashions. "See here the proof of your treachery! Is not this your portrait—the image of your face, person, and dress?"

"No!" cried Bonnard; "it is I who am the image of the dress and appearance of this engraving! I swear to you that these are figures of fancy!"

We shall not endeavour to detail the remaining particulars of this scene. It is enough to state, that Bonnard expended all his eloquence in French, Turkish, and Arabic, to prove that the engravings of the Journal were fancy-portraits. He appealed to every European in Cairo in proof of his assertion. The light of conviction at length dawned on the mind of Abdallah-Pacha, and his affection for his wife made him happy to entertain it.

"Here," said he at length, turning to the blacks behind him, and giving them the unlucky Journal, "this is what you shall throw into the Nile!"

The words startled Bonnard, but Abdallah continued, addressing him, "Bring your whole goods hither, and I will buy them at your own price."

Bonnard received a lesson from this incident, and so may every commercial man who goes to the east. Let them beware of jarring on the prejudices of those whose custom they seek.

OCCASIONAL NOTES.

ODDITIES OF GREAT MEN.

The greatest men are often affected by the most trivial circumstances, which have no apparent connection with the effects they produce. An old gentleman, of whom we knew something, felt secure against the cramp, when he placed his shoes, on going to bed, so that the right shoe was on the left of the left shoe, and the toe of the right next to the heel of the left. If he did not bring the right shoe round the other side in that way, he was liable to the cramp. Dr Johnson used always, in going up Bolt Court, to put one foot upon each stone of the pavement; if he failed, he felt certain the day would be unlucky. Buffon, the celebrated naturalist, never wrote but in full dress. Dr Routh, of Oxford, studied in full canonicals. An eminent living writer can never compose without his slippers on. A celebrated preacher of the last century could never make a sermon with his garters on. A great German scholar writes with his braces off. Reisig, the German critic, wrote his commentaries on Sophocles with a pot of porter by his side. Schbyel lectures, at the age of seventy-two, extempore in Latin, with his snuff-box constantly in his hand; without it he could not get on.

ASKING OPINIONS ON ONE'S OWN WORKS.

Every one who asks you your opinion on his book, does it in the spirit of the artist who invited a friend to look at a picture which he had lately completed, and said, "Here, what do you think of this? So-and-so was here the other day, and said he didn't like it, and I knocked him down stairs. Now, tell me your candid opinion." What is a man to say under such circumstances? Martial, in sending an invitation to a friend to come and visit him, after telling him what he will do for him, adds, "Nay, more, I'll read you nothing."

IMPLIED INSULT.

To ask a person *whom* he considers to be the *greatest* man in any department in which he thinks *himself* a proficient, is the sure way to offend him. Every one knows the story of Parr being asked who was the first Greek scholar in England, and saying that Porson was the first, Burney the third, and he would leave the inquirer to judge who was the second.

When Schbyel was in England a few years ago, and was entertained at one of the large club-houses, the conversation turned one day after dinner on the poets of Germany. Goëthe's death had just been announced, and Schiller had died many years before; and one gentleman who was present accordingly asked Schbyel, in allusion to the death of Goëthe, "What poets have you left *now*?" Schbyel, with indignant pride, and that vanity which it is so difficult for him to conceal even from a stranger, rose from his seat, and, drawing himself up to his full height, said, *Ich bin ein dichter.* ["I am a poet."]

GIBBON AND TACITUS.

There are many points of resemblance between Gibbon and Tacitus, not only in the temper and spirit of their history, but also in their style, though at first sight so dissimilar. One point, in particular, may be noticed. They are both very fond of classing together things which are not really connected, or are only fancifully connected. For example, Tacitus describes Germany as separated from the Sarmatians and Dacians *by mutual fear or mountains*. Not that mutual fear is a thing of the same kind as mountains; but the combination produces a startling effect, and gives one to understand more than the mere words would imply. The impression would be, that mutual fear is a barrier as formidable as mountains; or, perhaps, that if either one obstacle would not have been sufficient alone, both together were almost insurmountable. In the same way, Gibbon says, in his Autobiography, that if his conversion to Catholicism "had not stripped him of his academic gown, the five important years, so liberally improved in the studies and conversation of Lausanne, would have been steeped in *port and prejudice* among the monks of Oxford." The combination implies far more than the words would convey separately.

NARRATIVE OF A PRISONER OF STATE.

SECOND NOTICE.

"HEAVEN help the man that comes to be made 'an example of!'" said a friend of ours, whose remarks are ever full of point and significance. Poor Andryane, whose sole crime against Austria amounted to no more than a momentary ebullition of enthusiasm, followed up by no practical act whatever, was doomed to imprisonment for life in the dungeons of Spielberg, "as an example (to use the reported words of the Emperor Francis himself) to frighten any scoundrels of foreigners who might attempt to revolutionise the Austrian provinces." Yet, had the young Frenchman revealed the little that he knew of the secret purposes of the patriots of Italy—in other words, had he informed against his fellow-captives—he might have been liberated; and the priest Paolowitz tried him sorely with this view on many occasions. Others were tempted in the same way, and it ought to be mentioned, to the honour of human nature, that in spite of all the hopeless miseries of the Spielberg dungeons, but *one*, out of the many Italian prisoners there lodged, proved unable to stand this trial. After a vain endeavour to move Andryane, the conversations of the priest with his prisoner usually ended in the following way, and we repeat the words here, because they give an idea of the wishes of the Emperor Francis regarding the prisoners. "'I beg of you as a favour (said the captive to Paolowitz) to obtain for us some books.' 'Books! you have already more than you want; they only make your eyes weaker. Besides, reading tends to unsettle the mind. Look at me: I read no books but my breviary. Can you not while away your time by knitting or lint-making?' 'Knitting and lint-making occupy the fingers, but not the thoughts.' 'Thoughts! thoughts!' cried the bishop: 'his majesty, you well know, is *adverse to thinking*, and would have you employed only in one thing—in comprehending the heinousness of your crime, and imploring pardon of God.' 'Some good books—a Bible, or St Augustine—might, I imagine'—— 'Must I tell you the same thing a hundred times over! You cannot have them: his majesty will not permit it. Make up your mind upon this point: the determination of the emperor, who desires the salvation of your soul, is inexorable.' 'Salvation of my soul!—but if our minds become weakened by the inaction of captivity—if we are driven by our sufferings into idiocy!' 'Well, has not our Saviour said, "Blessed are those who hunger now; blessed are those who mourn?"' I do not know which irritated me most—the silly sardonic laugh with which this text was accompanied, or the profanation of the text itself. It cost me an effort almost superhuman to restrain myself from breaking out. With my head resting on my knees, which I convulsively clutched, and my eyes riveted to the ground, I remained silent; and I have always considered the silence which I then preserved, as the most meritorious triumph of patience I ever obtained over myself."

The allusion to "lint-making" requires explanation. Andryane had sought amusement and occupation in transcribing a German dictionary, word for word, on the walls of his cell with a nail, but he longed for work, as may well be imagined, of a more inspiriting kind, and begged of the governor to make a request of this nature to the emperor, without whose special orders a cell could not even be swept at Spielberg. "As we were thus pining, the commandant came one day to inform us that the emperor had replied to his excellency the governor on the subject of our petition, and that he had been pleased to grant our request. 'God be praised!' I exclaimed; 'we shall be allowed to use our limbs and to restore our health. On what work shall we be employed?—handling the shovel or the mattock, breaking stones or gardening? Pray, speak sir.' Surprised and embarrassed, the commandant hesitated to explain himself. At last he informed us that the occupation conceded us by his majesty was *lint-making*. I should have heard it repeated ten times before I could believe it. 'Lint-making!' I repeated in astonishment: 'what benefit can we derive from such a task, which will compel us to remain seated, while it is exercise and air that we implored of the emperor's humanity? It is no doubt a misunderstanding, and I suppose the governor himself has already remonstrated.' But the next day, poor Krall [successor to old Schiller, and a kind-hearted man], quite ashamed of the duty he had to fulfil, entered our cell, bringing in one hand a scale, and in the other a bundle of old linen. 'Gentlemen,' he muttered, blushing, 'here are your tasks. The commandant has doubtless informed you that you will have a certain quantity of lint to make daily, and I have come to weigh you each your share.' I could not help remarking, 'But this pretended boon is nothing more than an additional penalty.' 'Alas! gentlemen, it is no fault of mine: heaven knows how I wish that I could give you another employment. Have patience; this will not last long.' 'If the linen were only clean!' said I; 'but every piece of it is disgustingly dirty. Look here, Krall!' and I showed him the rags he had brought. 'Where have they been able to collect such filth?' 'At the *Great-hospital*, sir.'"

The unhappy request of Andryane thus led to the *compulsory* engagement of the captives in work which compelled them to "remain immoveable, and to breathe the miasma and the down of foul linen, without giving the slightest employment to the mind." Linen, too, from the Great-hospital!

Andryane had hitherto enjoyed the unspeakable comfort of the society of Confalonieri, a man whom he loved and admired beyond measure, and between whom and himself there was not a single secret. But he was destined not only to be deprived of this consolation, but to be shut up with another person, and that person the *one* traitor in this noble band of brothers. His patience forsook him at the announcement of this change. "I will not go," he exclaimed; "I prefer being alone for ten years, even for twenty, if necessary!" But remonstrances were vain, and he parted from Confalonieri with mutual sobs and tears. Judge S——, his new companion, seemed displeased also with the alteration. Words cannot describe the added sufferings now experienced by poor Andryane. He durst scarcely utter a word in his cell, much less attempt a renewal of the little correspondences on which the former comforts of existence hung, for fear of being betrayed by the man with whom he was shut up night and day. Pellico and Maroncelli were in a neighbouring chamber, and by speaking through the loop-holes in low tones, acquired by custom, short conversations could be kept up in spite of the sentinels. These conversations were hateful to S——, who knew that his treachery was suspected as the cause of the increased sufferings to which his fellow-prisoners had been subjected. After a prying visit of the officials one day, "'I will open the window,' I said, as soon as the police left us; 'the dust here is enough to stifle one.' And as I proceeded to admit some fresh air into the cell, S—— cried angrily, 'Are you then so blind that you cannot see I am naked? are you in such haste to renew your chattering with Pellico? I have had enough of that—do you understand? My patience is worn out, and I will not have the window opened.' As he spoke these words, he rushed towards me with so much violence that I thought at the moment we should have come to blows." * * At length S—— was taken away; he was liberated—the reward of his treachery. At first, Andryane was almost intoxicated with joy. "'He is gone!' I exclaimed, clapping my hands, and dancing about my gloomy cell; 'I can now whistle, talk, and amuse myself as I please—open the window, and converse with my neighbours whenever I like.' I sprang up to the loophole, and, although it was night, called Maroncelli and Pellico, to say to them, as Moretti did when S—— quitted him, 'I am no longer under restraint, my friends; rejoice with me, my persecution is at an end.' The 'Silence!' repeated by the different sentinels prevented their replying, and I was compelled therefore to repress the outburst of my joy. Tired at last of pacing backwards and forwards in my prison, of which I now felt myself in full possession, I lay down on my bed, most happy that I had no longer a head within two feet of mine ever watching me."

But S—— seems to have completed his defection, by giving information of the conversations at the window with Pellico and Maroncelli, and when Andryane attempted to renew them, a stern "Silence!" from the vigilant sentinels instantly repressed the endeavour. Soon after, he had the pleasure of being restored to the cell and company of Confalonieri. The change was productive of one misfortune. One of the jailors lived in an adjoining cell, and kept a lighted stove, which almost destroyed the weakening sight of Andryane. His eyes and face were inflamed daily and nightly; yet, though all were willing to remove the cause of suffering, nothing could be done until orders arrived for the special purpose from Vienna. The immediate cause of mischief was removed, but the eyes of the captive remained very weak. Andryane was also distressed at this time by the news of his father's decease. To lighten this load of calamity, a hope of escape sprang up. Through a keeper, who became willing to aid them, Confalonieri corresponded with his wife, and all was got ready for an escape. But, on consultation, it was found that *one* only could be freed, and now the noble-minded Confalonieri gave a surpassing proof of fraternal love and friendship. On the evening appointed for the attempt, Andryane entreated him to "think of his beloved wife, and fly!" "'For pity's sake say no more,' returned Confalonieri: 'let me reflect; I will call you presently.' And saying these words, he retired to his cell, desiring me to go to bed. 'Do not forget,' I added, 'that early to-morrow morning you must reply. Frederick, I entreat you, let the thought of Theresa alone be present to you.' Notwithstanding the desire I felt at such a moment to move about in my dungeon, I seated myself on my pallet, that Confalonieri's reflections might not be disturbed. The evening wore on. I heard eleven, twelve, then one o'clock strike, and Confalonieri had not called me—not moved. I began to apprehend that he had fallen asleep, or that, too weak to endure his emotions, he had been seized by one of those long fainting fits which had alarmed me so much during my journey from Milan to Spielberg. Trembling at this idea, I was about to go to him, when his voice reached my ear. In less than a second I was by his side, and asked anxiously, 'What have you resolved?' 'To remain at Spielberg.' 'I cannot believe it,' I cried: 'it is impossible!' 'I will not abandon my companions to their sad fate; I cannot leave you alone, exposed to the displeasure of the emperor; my conscience and honour forbid me. I will never profit by any good fortune that may injure my fellow captives.'" Human sufferings are to be deplored, but they have their use. A thousand insurrections could not plead more strongly against unjustly based or improperly exercised authority, than such a narrative as that before us.

In 1830, after six long years of captivity, Andryane and his companion had the pleasure of learning that Pellico and Maroncelli were released. But Andryane's eyes became gradually worse, and medical advice, as well as more lengthened visits to the platform, were allowed him. At the same time, knitting and lint-making, the continuation of which was enforced, rendered these indulgences almost totally fruitless. "Adding to the miseries of our prison the grief caused by the death of my father, and the distracting anxiety of my companion respecting his consort, an idea may be formed of our life during the winter of 1830–31. The uneasiness of Confalonieri was rendered still greater by some hints of the director of police, which confirmed the apprehensions he had already entertained about the health of his adored countess, in consequence of the intelligence he had received at the period of the last attempt at escape. I did every thing in my power to dispel the gloom of his mind by words of hope and consolation. He listened, and appeared touched by my tenderness; but he repeated, in a tone that pierced my heart, 'I shall never see her again, my friend—I shall never see her again!' He then entreated me to leave him alone, that he might without restraint weep over her, to know whose fate he would willingly have sacrificed his life. All day and night I heard the exclamation of 'Theresa, my beloved Theresa!' mingled with sighs and sobs." Poor Confalonieri's wife, a woman of extraordinary beauty and virtue, died at length of a broken heart. The *cause* need not be told.

In the end of 1831, the cholera broke out near the fortress, and finally in it. The captives petitioned in vain to be attended to, and to be taken to the hospital of the common felons. "On bodies so attenuated as ours, the influence of the cholera could not fail to have an effect. Swimmings of the head, intestinal pains, unusual weakness, indicated too strongly, and were in our eyes certain signs, that we should not escape the pestilence. One night after the last visit, Confalonieri was seized with a fit of shivering and violent pain in the bowels. Other alarming symptoms soon appeared. It was a terrible moment to my heart! I knocked at the door to ask for assistance. The jailers refused at first to reply; and when at last, at my redoubled knocks, one of them came, he told me that the commandant had the keys, and that no one could enter the prison till five o'clock in the morning. In vain I exclaimed in my anxiety that the case was urgent, and that my friend, if abandoned, might die for want of help. He merely repeated, 'I can do nothing—I can do nothing; the commandant has forbidden us to interrupt him.'" Happily, however, Confalonieri recovered, and the visit of the cholera had only the effect of adding another item to the inhumanities of Spielberg.

Our notice of this most interesting book must now be brought to a close. The sister of Andryane, a woman of the most elevated mind and most devoted heart, had never ceased her exertions in her brother's favour. She had travelled several times to Milan and Vienna, to beg his liberation at the feet of the emperor himself. On her last visit to Vienna she was successful, after such agonies of suspense as can only be appreciated by reading her own record of them, given in the volume before us. In the beginning of March 1832, Andryane was liberated from the cells of Spielberg. His joy was damped, however, by leaving Confalonieri behind him, a captive still. The following extract from a journal kept by the sister, describes her meeting with her brother at the town of Schoerding:—"Wednesday, March 20th. Day of eternal happiness—he is restored to us! At daybreak I was on the balcony, after having prayed God to grant

Digitized by Google

strength and courage to all of us, for I trembled lest the prisoner should suffer from the excess of his emotion. About two o'clock, a postchaise appeared in sight. I called to my cousin, although scarcely able to speak. 'Look! a tall man is getting out of the carriage. It is he, I am certain: Alexander, answer me!' A face, pale and emaciated, turned and raised its eyes towards me on hearing my voice. I could not contain a cry of sorrow. 'It is he; but how could I have recognised him!' And I fell on a seat, and could not find strength or speech. My cousin rushed towards the staircase before I was able to stand. He returned leading and supporting my unfortunate brother, who threw himself into my arms, repeating only, with sobs, '*Old—old—dead there without you!*' More than an hour elapsed before we could recover from our agitation. Nothing had prepared me to see him thus—dying, presenting the appearance of an old man by his bent figure, and his cadaverous complexion."

We cannot help adding a few words more. Indeed, it is in some measure imperative upon us to do so, seeing that, in our article upon Andryane's narrative of 1837, we expressed our pleasure at the promulgation, about that period, of an act of amnesty, "recalling the political exiles of Italy, and giving freedom to all who remained in durance." This was a mistake. A few "young men of family" were then permitted to return from banishment by the successor of the Emperor Francis, but these were merely fugitives, against whom no specific sentence had been passed. Those who had actually undergone conviction "for having done or said any thing, however trifling, against the sovereign or his government, are still left lingering by hundreds in Hungarian fortresses, or in exile." The amnesty, so much boasted of by the partisans of Austria, proved but "a fraud (says Signor Prandi) to obtain a good reception for the new Emperor Ferdinand on his visit to Italy." The system of things, therefore, described by Andryane and Pellico, still exists, and to Ferdinand may be applied the words used in reference to his father by a British reviewer of Pellico's narrative. "Have his ministers and courtiers allowed the Austrian sovereign to be enlightened as well as saddened by the sight of these high-minded and deeply affecting Memoirs? Does he know the merit, the goodness, the piety, of which he has been made the jailer? Has he been enabled to measure the full extent of the barbarous injuries of which God will one day make himself the avenger? Are his dreams never haunted by the vision of the scholars and gentlemen of Italy, working in prison-clothes in their Moravian dungeon, bent down by chains under whose weight they are unable to walk, and the pressure of which will not let them sleep, sickening at the smell of food so uneatable that the famished cannot taste it, fainting under the indirect assassination of a sunless atmosphere, and a slow starvation; perishing from the heart's longings after friends to whom they may never write, after parents from whom and of whom they must never hear; supporting each other by manly and religious hopes against desperate temptations to self destruction; the objects of silent and tremulous compassion to even the lowest ministers of abused justice; to all but to him who alone had the power of relieving them!"

HUMOROUS SCENE FROM "INGLISTON," A NOVEL.

"INGLISTON" is a novel, in one volume,* chiefly devoted to the history of a young female, the natural daughter of a Scottish baronet, and a person of the finest bodily and mental qualities, but in whom all is rendered nugatory for her own happiness by the awkwardness of her social position. Miss Margaret Inglis, as the heroine is named, is by accident thrown for a time into the charge of Mrs Wildgoose, an elderly female of dubious character and intense vulgarity, who occupies a house in Edinburgh, part of which she lets as business chambers to a writer to the signet, and part as furnished lodgings. Here a tea and supper party, given for Miss Inglis's amusement, affords the author an opportunity of introducing a scene of broad humour, which many will recognise as but slightly a caricature of real life. The best parts of this scene are as follows:—

"The ladies of the party, with a very thin sprinkling of gentlemen, arrived at seven to tea and coffee; and Mrs Wildgoose introduced, in an especial manner, to all and each of them, 'her particular friend from the country, Miss Inglis of Ingliston, daughter of the late Sir Norman Inglis;' and Margaret had to go through the ceremony of shaking hands with the whole of the guests, male and female.

There were the Miss Shorts, and the Miss Blythes, the Miss Brocks, and the Miss Brownlees, four families of sisters, consisting of three each; and their brothers were expected, when they shut their shops, or left their counting-rooms. There was Miss Meek, Miss Bow, and Miss Bondy, Miss Gowanlock, and Miss Clinkscales, Miss Cogie, and Miss Bogie, and twenty other misses, to whom the reader can have no desire to be introduced. And of the gentlemen who liked a good pennyworth of what was going, and had come in for a share of the tea-drinking, there was Captain Stark, the coal-agent; Mr Sprot, the ringer of the music-bells; and Mr Burns, the sub-collector of government assessments; Mr Drew, the dentist; Mr Ballantyne, a student of divinity; Mr Piper, an accountant's clerk, an inmate of the house, who lodged in one of Mrs Wildgoose's attics; Lieutenant Darling, a lean elderly gentleman, with a nose in full blossom, who lived upon his money; and Mr Macintosh, a solicitor before the supreme court. And this is but a trifling fraction of the living mass which squeezed into Mrs Wildgoose's public rooms, between the hours of nine and eleven.

The guests amused themselves in various ways between tea and supper. The younger and more agile part of the company danced up stairs in the drawing-room to Miss Cogie's music, till they were like to drop down themselves, and to break down the ceiling of the room beneath; and in a little space left in a corner, stood a card-table, where Mrs Wildgoose and Captain Stark, Mr Macintosh and Miss Meek, contended for victory at a game which should have been whist, but, in condescension to Miss Meek's capacity, was only catch-the-ten.

During these agreeable proceedings above stairs, the lieutenant, and the sub-collector of the king's taxes, and the ringer of the music-bells, were settling the affairs of the nation in a parlour below, over a tumbler of rum and whisky punch; while the clerk of the attic, the student of divinity, the dentist, and a few other kindred spirits who had joined their company, also in the parlour, together with a bevy of young girls, who liked other fun better than dancing, played at fortune-telling, conversation-cards, and forfeits, which latter were redeemed by many ingenious and novel inventions, besides the long kiss in the corner, and the spelling of opportunity behind the door.

In the course of time it became necessary to desist from all these harmless sports, namely, when the performers were tired of them, and when the piano strings were starting, and its notes rendered dumb by Miss Cogie's indefatigable thumping, and the company both above and below rendered deaf with the noise of the dancers, and the dancers' throats dry and sore with the dust they had raised from the carpet—for Mrs Wildgoose had had the floor-cloth taken off, but in the pride of her heart left on to be seen her Brussels carpet, which she had bought at a lord of session's roup, and which, by candle-light, passed for being fresh out of the loom, and by day-light might have passed for the same, if it had not been a little bare at the door, and at the windows, and near the hearth-rug, and a little more bare where the deceased lord's table, with his draught-boards, used to stand; and these partial symptoms of tear and wear were on this festive occasion rendered much more obvious and general, so that the dancers with the dry and sore throats, and the Brussels carpet, were mutual sufferers, and must have parted with mutual sympathy and consent when the supper hour arrived; and the card-players, being by that time perfectly enfeebled by their mental exertions, simultaneously threw down their newly-dealt hands, and straightway headed the procession which descended to the refreshment room.

There was in Mrs Wildgoose's supper-room a long table covered with refreshments of every sort—every thing, in short, in or out of season, that ever was set upon a supper-table. There were dishes cold and hot, dishes costly and common, in such variety and abundance as would suit every taste and would satisfy every hungry appetite. And another table of smaller dimensions was set out on equally liberal principles, with liquors malt and spirituous, with a few decanters of foreign and home-made wines, which, like the Brussels carpet, were more for show than service, and a host of hot water jugs and toddy ladles, and the whole contents of a crystal shop of tumblers and glasses.

It was not intended, and the company did not attempt it, that they should sit round the table, but they sat as they could, and how they could, two to a chair all over the room, thick and throng, with each a plate on his or her knee; and the first heat of carving, and helping, and stuffing, was over, before it was observed that one of the party was missing.

Mrs Wildgoose had fancied all along that Miss Inglis was among the dancers. The dancers fancied she was among the forfeit-players or the punch-drinkers, and had given themselves no concern. The players at forfeits and the punch-drinkers had thought nothing at all about the matter. But she had been among none of them, for on the move being made after tea, when the company separated into different groups, each seeking their own amusement, Margaret had slipped away unobserved to her own room, and there she sat in the dark actually crying with vexation.

Her hostess found her out, and she hastily dried her tears and tried to appear unconcerned, and she was dragged down to the room below, and there was a general shout of joy when she made her appearance. Captain Stark clapped her heartily on the shoulder, and, with a familiar wink, asked her if she had been taking a *snooze*? The solicitor before the supreme court helped her to a chair; and the lieutenant with the blooming nose gave her arm a gentle pinch in passing, and proposed a bumper to her restoration as queen of the company.

'Hip, hip, hip, hurra! hurra!' roared all the men, starting on their feet and flourishing their glasses; and the din and roaring were like to rend the walls of the apartment, and Margaret sank down upon the seat which was set for her, pale as death, and stunned with the noise, and like to faint with terror and dismay.

'You must return thanks for that,' cried Mr Burns, the gatherer of the window-light assessment and house duty.

'You must make a speech,' cried Mr Herdman, a tall, swarthy, strong-built man, with a loud voice, whose appearance very much suggested the idea of a huge quadruped on its hind legs. This was a gentleman who took a lead on the occasion, and was acting at one end of the table, on which were the bottles and glasses, as master of the ceremonies, over a jug of punch-royal, and he was also at times the buffoon of the company.

'The queen deputes you to make a speech for her,' cried Mr Drew, the dentist.

'Does your majesty depute me?' roared Mr Herdman, who had much ado to make himself to be heard amid the confusion of tongues. 'Does your majesty depute me?' vociferated he a second time, while Margaret sat speechless and shaking, with a glass of hot negus which the solicitor had put into her hand.

'Yes, yes, don't you hear? Yes,' cried the lieutenant. 'Don't you know, man, that silence is consent?'

And without more ado, Mr Herdman rose up, and began his speech forthwith.

'By the permission and special commission,' said he, 'of her most gracious majesty, Queen Margaret' —— Here a boisterous peal of laughter from all the company, with clapping of hands, broke in upon Mr Herdman's oration.

'I am hereby,' roared he, in a voice which got above the other din, 'I am hereby deputed, appointed, and commanded, to notify and propound to you her liege and loving subjects, her majesty's most gracious will and pleasure regarding—regarding—that is to say concerning—concerning—I say' ——

'You're off your eggs now,' cried Lieutenant Darling, swilling off a glass of toddy.

'Concerning,' continued the speechifier, looking fiercely indignant at the lieutenant, but nothing daunted by the interruption; 'concerning, I say, the late most gratifying testification of your loyalty and attachment to your sovereign. And her most gracious majesty's will and pleasure is' ——

'Hear, hear,' cried Mr Gollochar, the hatter.

'Hear, hear,' responded Captain Stark.

'And it is the will and pleasure of her most gracious majesty' —— proceeded the orator.

'Out with it at once, man,' cried Lieutenant Darling. 'We are all wearying for her majesty's will and pleasure.'

'Call to order,' cried Mr Herdman, in a tremendous voice; 'I can't get on with so many interruptions.'

'Order,' screamed Mrs Wildgoose, in a shrill key.

'Order,' roared Gollochar, with an accompanying slap upon the table with the palm of his hand, which made all the glasses jingle, and the Miss Brocks, and the Miss Blythes, and the Miss Shorts, giggled in full chorus.

'Order, ladies, I say,' vociferated Mr Herdman.

'Nay, it is order, gentlemen, I think,' bawled Mrs Wildgoose.

'Your majesty must assert your authority here,' interposed Mr Macintosh, relieving Margaret from the glass of untasted liquor, which he saw was only an annoyance and encumbrance to her. 'I fear,' continued he, 'you have chosen an unskilful commissioner.'

'She may easily appoint another,' said Gollochar to Macintosh. 'What do you say to accept of the office yourself? You are a capital hand at a speech.'

'Hear, hear! Mr Deputy Macintosh's speech,' shouted the sub-collector of the taxes.

'Mr Deputy Macintosh's speech,' echoed Mr Piper of the attic.

'Mr Deputy Macintosh's speech,' shouted all the company.

But an interruption was put to the business by the announcement of a new guest, namely, Bailie Liddel of the Canongate, who came puffing and blowing from a committee meeting, which had detained him till a late hour.

'What a walk I have had, or rather race!' said the bailie, wiping, with his silk handkerchief, the drops of perspiration from off his brow and face.

'What will you take, bailie?' said the mistress of the ceremonies, in her sweetest tone.

* Ingliston. By Grace Webster. Edinburgh: W. Tait, 1842.

Digitized by Google

'I can be at no loss here among such a variety,' replied the bailie, casting his eye across the long table, still amply furnished with eatables, and then glancing along the other table, which offered a no less promising spectacle in the drinking department. 'But,' continued the magistrate of the Canongate, 'I think a thimbleful of a raw dram first will be the best thing to keep off the cold.' And, accordingly, the gentleman helped himself to a thimbleful, that is, a thistleful of brandy, and afterwards to a draught of porter; for he was hoarse with his oratory at the meeting he had just left, and he pronounced speaking to be 'drouthy work,' and he proceeded to stay his stomach with a slice of the salt round, a leg of a turkey, a 'tasting' of the lamb pie, some veal croquets, a few custards, and a couple of jellies. Afterwards, by way of amusement, he nibbled at a tart and a cheese-cake or two, and then entered upon the occupation deliberately of mixing a rummer of hot punch to keep all these ingredients in good agreement in his stomach. And while he was engaged in the consuming of this potation, Miss Macgeggins of the Catholic Chapel, and the other musical geniuses of the party, were preparing to sing; and each in succession, and sometimes two or more at a time, squalled to the audience, till Lieutenant Darling, who abominated music himself, referred it to the company if it were not true that too much of any thing was good for nothing!

'I agree with you,' said Bailie Liddel, stirring in his tumbler a fresh supply of whisky and water. 'It is like Deacon Dowie's speech at the meeting about the choking-up of the sivers and the overflowing of the gutters, which had to be cut short, sir, without ceremony, or we would have been nailed to the spot listening to him all night.'

In the mean time, Mr Herdman had disappeared, and, by way of varying the amusement, explored his way, we do not curiously inquire how, to Mrs Wildgoose's sanctum in the upper regions. Whether he went with or without a guide, we cannot precisely tell; but he returned in a short time as a personation of the lady of the mansion, dressed in her crimson chintz gown, her mantle of grass-green gros-de-Naples lined with rose pink, her purple velvet bonnet and feather, with blond lappets, and all proper appliances, and a solitary bunch of brown, dried-up, frizzled hair stuck out upon the middle of his brow, like the curled locks on a bull's forehead. Tall as Mrs Wildgoose was herself, her habiliments did not reach below the middle of the leg of this gigantic masquerader. His dark complexion, however, was on a par with the lady's olive visage.

'I am most happy to have the pleasure of seeing you in my house on this occasion, and hope soon to have another opportunity of having you all to partake of my hospitality,' said Mr Herdman, addressing the company in a soft, mimic tone, so perfectly resembling the voice of Mrs Wildgoose, that the likeness was irresistible. The whole company were in a roar of laughter. The tears started from the eyes of Captain Stark and Bailie Liddel, while the huge female figure paraded about where it could find a footing, and complimented the guests all round, and made such antics and ludicrous movements, that peal succeeded peal of tremendous merriment; and the grotesque figure began to caper in a *pas seul* upon the floor, and the circle opened up to make room for its evolutions, and, to the infinite astonishment and delight of the beholders, it mounted upon the table where the liquors were, and footed it most nimbly among all the bottles, and glasses, and drinking apparatus, and committed not the slightest damage; then down he came with all the agility of a child, and recommenced his steps upon the carpet, and Gollochar came forward as a partner, and the two hooked their arms together, and reeled, and wheeled, and waltzed, and uttered alternately at intervals the most terrific and astounding yells; and some of the rest of the company, inspired by the example, got upon their legs, and joined in the dance, while the circle widened to give them room, and the lookers-on crowded near the walls, or mounted on chairs, to save their toes from being trod upon.

Music was not missed, for it could not have been heard amid the clamour, and the roaring, and the laughter.

They waltzed, and reeled, and wheeled about, tugging and dragging at one another, with such hearty good will, that cries of 'Oh, dear!' 'What do you mean?' 'Mrs Wildgoose, will you settle Mr Fork?' 'Mrs Wildgoose, will you speak to Mr Gowanlock?'—and a variety of such like exclamations and invocations, uttered by shrill female pipes, were heard above the other din.

The wreck and devastation of the ornamental, and some portion of the useful, part of the ladies' dresses, fully justified their giving vent to those thrilling complaints. The Miss Blythes' wreaths of artificial roses were torn remorselessly from their heads, and trampled under foot. The Miss Brocks' greasy, filthy-scented ringlets, met with the same unhappy fate, together with bracelets, handkerchiefs, and scarfs, and dirty, tattered, battered, damp gloves, without number. Miss Bendy's comb of polished horn, was dashed to the ground. Miss Macgeggins' towering ornamental comb of pearl paste, with cruel gilt teeth, was driven into her skull, and while she was suffering from this inhuman infliction, which was the unnatural result of certain kind familiarities of Mr Gowanlock, Mr Herdman's gigantic form came sweeping past behind her, like a man-of-war in a storm coming drive against the stern of a little brig, and carrying all away before it. And the ill-fated young lady had her gauze skirt and petticoat of glazed cotton torn from her waist, and the lacings of dirty corsets and partial glimpses of dusky under-garments, were thereby disclosed to the company, to their infinite entertainment and delight."

DR CHANNING ON HARD WORK.

THE following striking thoughts occur in a new brochure of the famous Boston preacher, entitled, "Lectures on the Elevation of the Labouring Portion of the Community," of which a neat and cheap reprint has been issued in this country.*

"By the elevation of the labourer I do not understand that he is to be raised above the need of labour. I do not expect a series of improvements, by which he is to be released from his daily work. Still more, I have no desire to dismiss him from his workshop and farm, to take the spade and axe from his hand, and to make his life a long holiday. I have faith in labour, and I see the goodness of God in placing us in a world where labour alone can keep us alive. I would not change, if I could, our subjection to physical laws, our exposure to hunger and cold, and the necessity of constant conflicts with the material world. I would not, if I could, so temper the elements that they should infuse into us only grateful sensations, that they should make vegetation so exuberant as to anticipate every want, and the minerals so ductile as to offer no resistance to our strength or skill. Such a world would make a contemptible race. Man owes his growth, his energy, chiefly to that striving of the will, that conflict with difficulty, which we call Effort. Easy, pleasant work does not make robust minds, does not give men a consciousness of their powers, does not train them to endurance, to perseverance, to steady force of will, that force without which all other acquisitions avail nothing. Manual labour is a school, in which men are placed to get energy of purpose and character, a vastly more important endowment than all the learning of all other schools. They are placed, indeed, under hard masters, physical sufferings and wants, the power of fearful elements, and the vicissitudes of all human things; but these stern teachers do a work which no compassionate indulgent friend could do for us; and true wisdom will bless Providence for their sharp ministry. I have great faith in hard work. The material world does much for the mind by its beauty and order; but it does more for our minds by the pains it inflicts, by its obstinate resistance, which nothing but patient toil can overcome; by its vast forces, which nothing but unremitting skill and effort can turn to our use; by its perils, which demand continual vigilance; and by its tendencies to decay. I believe that difficulties are more important to the human mind than what we call assistances. Work we all must, if we mean to bring out and perfect our nature. Even if we do not work with the hands, we must undergo equivalent toil in some other direction. No business or study which does not present obstacles, tasking to the full the intellect and the will, is worthy of a man. In science, he who does not grapple with hard questions, who does not concentrate his whole intellect in vigorous attention, who does not aim to penetrate what at first repels him, will never attain to mental force. The uses of toil reach beyond the present world. The capacity of steady, earnest labour is, I apprehend, one of our great preparations for another state of being. When I see the vast amount of toil required of men, I feel that it must have important connections with their future existence; and that he who has met this discipline manfully, has laid one essential foundation of improvement, exertion, and happiness, in the world to come. You will here see that to me labour has great dignity. It is not merely the grand instrument by which the earth is overspread with fruitfulness and beauty, and the ocean subdued, and matter wrought into innumerable forms for comfort and ornament. It has a far higher function, which is, to give force to the will, efficiency, courage, the capacity of endurance and of persevering devotion to far-reaching plans. Alas, for the man who has not learned to work! He is a poor creature. He does not know himself. He depends on others, with no capacity of making returns for the support they give; and let him not fancy that he has a monopoly of enjoyment. Ease, rest, owes its deliciousness to toil; and no toil is so burdensome as the rest of him who has nothing to task and quicken his powers.

I do not, then, desire to release the labourer from toil. This is not the elevation to be sought for him. Manual labour is a great good; but in so saying, I must be understood to speak of labour in its just proportions. In excess it does great harm. It is not a good, when made the sole work of life. It must be joined with higher means of improvement, or it degrades instead of exalting. Man has a various nature, which requires a variety of occupation and discipline for its growth. Study, meditation, society, and relaxation, should be mixed up with his physical toils. He has intellect, heart, imagination, taste, as well as bones and muscles; and he is grievously wronged, when compelled to exclusive drudgery for bodily subsistence. Life should be an alternation of employments, so diversified as to call the whole man into action. Unhappily our present civilisation is far from realising this idea. It *tends* to increase the amount of manual toil, at the very time that it renders this toil less favourable to the culture of the mind. The division of labour, which distinguishes civilised from savage life, and to which we owe chiefly the perfection of the arts, tends to dwarf the intellectual powers, by confining the activity of the individual to a narrow range, to a few details, perhaps to the heading of pins, the pointing of nails, or the tying together of broken strings; so that, while the savage has his faculties sharpened by various occupations, and by exposure to various perils, the civilised man treads a monotonous, stupifying round of unthinking toil. This cannot, must not, always be. Variety of action, corresponding to the variety of human powers, and fitted to develope all, is the most important element of human civilisation. It should be the aim of philanthropists. In proportion as Christianity shall spread the spirit of brotherhood, there will and must be a more equal distribution of toils and means of improvement. That system of labour which saps the health, and shortens life, and famishes intellect, needs, and must receive, great modification. Still, labour in due proportion is an important part of our present toil. It is the condition of all outward comforts and improvements, whilst, at the same time, it conspires with higher means and influences in ministering to the vigour and growth of the soul. Let us not fight against it. We need this admonition, because at the present moment there is a general disposition to shun labour; and this ought to be regarded as a bad sign of our times. The city is thronged with adventurers from the country, and the liberal professions are overstocked, in the hope of escaping the primeval sentence of living by the sweat of the brow; and to this crowding of men into trade we owe not only the neglect of agriculture, but, what is far worse, the demoralisation of the community. It generates excessive competition, which of necessity generates fraud. Trade is turned to gambling; and a spirit of mad speculation exposes public and private interests to a disastrous instability. It is, then, no part of the philanthropy which would elevate the labouring body, to exempt them from manual toil. In truth, a wise philanthropy would, if possible, persuade all men of all conditions to mix up a measure of this toil with their other pursuits. The body as well as the mind needs vigorous exertion, and even the studious would be happier were they trained to labour as well as thought. Let us learn to regard manual toil as the true discipline of a man. Not a few of the wisest, grandest spirits, have toiled at the work-bench and the plough."

* Glasgow, James Hedderwick and Son.

A MOTHER.

There's music in a mother's voice,
More sweet than breezes sighing;
There's kindness in a mother's glance,
Too pure for ever dying.

There's love within a mother's breast,
So deep, 'tis still o'erflowing,
And care for those she calls her own,
That's ever, ever growing.

There's anguish in a mother's tear
When farewell fondly taking,
That so the heart of pity moves,
It scarcely keeps from breaking.

And when a mother kneels to Heaven,
And for her child is praying,
Oh, who can half the fervour tell,
That burns in all she's saying?

A mother! how her tender arts
Can soothe the breast of sadness,
And through the gloom of life once more
Bid shine the sun of gladness.

A mother! when, like evening's star,
Her course has ceased before us,
From brighter worlds regards us still,
And watches fondly o'er us.

—*Glasgow Free Press* (*newspaper*).

WAR.

The following sarcastic recommendations are given by Dr Benjamin Rush, an eminent American physician and philanthropist, who died about thirty years ago:—

"In order to impress more deeply the minds of the citizens of the United States with the blessings of peace, by contrasting them with the evils of war, let the following inscription be painted on the sign which is placed over the door of the war-office at Washington, namely:—

An office for butchering the human species.
A widow-and-orphan-making office.
A broken-bone-making office.
A wooden-leg-making office.
An office for creating public and private vices.
An office for creating public debt.
An office for creating famine.
An office for creating pestilential diseases.
An office for creating poverty, and for the destruction of liberty and national happiness.

In the lobby, let there be painted representations of the common instruments of death; also, human skulls, broken bones, hospitals crowded with sick and wounded soldiers, villages on fire, ships sinking in the ocean, rivers dyed with blood, and extensive plains without a tree or fence, or any other object but the ruins of deserted farm-houses.

Above this group of woful figures, let the following words be inserted in red characters, to represent human blood:—

NATIONAL GLORY!"

PICTURE OF THE INDIGENT CLASS OF A LITTLE TOWN.

MUCH as has been written on the subject of the poor, the public has never yet had presented to it any thing like an express picture of the actual condition of the indigent class in any one spot of the earth. Even that most faithful depicter of the humble, Crabbe, did not profess to describe the poor, the whole poor, and nothing but the poor, of one place: in all probability, he assembled features and cases from various districts, and grouped them into one picture; at least, we have no certain assurance that he did not do so. It lately occurred to us, in consequence of the discussions which have been taking place respecting the management of the poor in Scotland, that, if some well-defined district were pitched upon, and an accurate estimate formed of the amount of poverty in that district, the result might be of such a novel and interesting nature as to gratify the entire circle of our readers, at the same time that it might throw some light on a question which has, at the present moment, a peculiar importance within a narrower field. We therefore proceeded to a small town, with which we happened to be well acquainted, and set about making the necessary inquiries, the result of which we now propose to lay before the world. The name of this town, and its geographical situation, further than that it is in Scotland, are not necessary to the question: we conceal them, because it would be indelicate towards private parties to disclose them. The public, however, have the guarantee of any credit for veracity which we may have established with them, that the general description of the place, and all the particulars of its indigent class now to be given, are set forth truly.

This town is expressly and thoroughly a rural one. The district of which it is the centre, consists of arable and pastoral farms, and is almost as isolated by a bounding range of mountains as was the valley of Rasselas. There are no manufacturing establishments within many miles. The town, which contains about two thousand inhabitants, depends entirely on the supply of articles of necessity to its well-defined little district, and on the rural labour of its own humblest class; or, if there be any exception worth speaking of from this general description, it lies in two boarding academies, attended by boys from a distance, and in the existence of a few weavers who obtain work from Glasgow. It is common to describe such places as dull and more than ordinarily poor, and it may on that account be objected to as a fair specimen of the country at large. But, though it may be poorer than most manufacturing towns, we see nothing to prevent us from considering it as *a fair specimen of the towns in purely rural districts*. It possesses all the orders of society which a rural district gives occasion for in a town population, and all the residuum of poor which naturally falls from such a system of things. If not deriving wealth from manufactures, neither does it gather to itself, as most manufacturing towns do, the miserable of distant districts. In point of fact, however, it must derive wealth from manufactures in an indirect manner; for the produce of the district must be sold at higher rates than would otherwise be the case, in consequence of there being manufacturing customers for it.

The population of this town is just about 2000: a small rural tract, forming part of the same parish, may contain 600 more; but with these we have little to do. The town contains the usual variety of traders, some of whom have a tolerably good business, while others are in a very small way. There are two or three clergymen, and two or three medical men; a few legal practitioners in the sheriff court; a very few families living independently of trade; a considerable number of the ordinary artificers, as blacksmiths, tailors, shoemakers, &c.; and also a considerable number of labourers, of both sexes. Society, both in the town and its neighbourhood, is remarkable for the permanency of its forms. It has not for a long period been much richer or poorer than it now is. The gains of trade and the wages of labour are remarkably equable. A considerable number of persons have a little property, but few have much wealth. Traders are the fathers of traders, artificers of artificers, and labourers of labourers, with comparatively few exceptions. Some young men of the middle class emigrate to more active scenes, but few others do so; and thus from generation to generation little change of any kind takes place.

From what we had formerly known of the town, we were prepared to find, on careful inquiry, a considerable number of indigent persons; but the real number found, and the degree of indigence which characterised them, were far beyond what we had expected. Our attention was first directed to those who receive relief from the poor's funds of the parish, through the hands of the kirk-session.* The number of entries on the roll kept by this body during 1839, was 42. Four related to individuals residing at a distance, but having claims on this parish, leaving 38 resident paupers. Of these, 24 were females, 10 males, and 4 were children. In only 18 of the cases can the party be said to be single or solitary: in the other 20, the party is either plural, or at least connected with other parties, who are wholly or partially dependent on the aid granted. The real number of pauper children, exclusive of some others who only receive gratuitous education, is 9. The whole sum expended weekly on the 38 resident paupers was L.3, 6s. 3d., being at the rate of 1s. 9¼d. to each. By careful inquiry we obtained correct memoranda of the condition of all the persons on the poor's-roll, in order that the public may judge how far the sum given to each is adequate or suitable.

The largest sum given to any resident pauper in our list is 4s. a-week; and there is but one case of so large an aliment. It is for an old woman of imbecile mind, who, being unable to take any care of herself, and having no relations on whom she could depend, boarded and lodged with a poor family. The sum here given is probably the lowest at which the session could induce any family to take charge of such a person. Below this case, the largest weekly sum given is 2s. 6d., of which there are four cases. All of these are of a certain pretty well-defined character. One is a middle-aged insane female, who lives with a mother and sister, the latter of whom is a field-labourer. Here, we believe, it is presumed that the earnings of the sister should do a little for the pauper. Another case is that of a very infirm old widow, who has another old but rather less infirm woman living with her, by whose aid she makes a little by selling coal in small quantities. Here there are, in reality, two paupers; but, then, the coal business is presumed to do something for both. Half-a-crown a-week is therefore judged sufficient; but in reality it is not, and these two poor women would be in great wretchedness but for the kindness of a benevolent lady in the neighbourhood, and occasional aid from other quarters. The third of the half-crown pensioners is an old reduced shopkeeper, who has a paralytic and bed-rid wife, but who has 2s. weekly from other sources. The fourth is a middle-aged man, once an artisan, but now stone-blind, and who has a little girl, his daughter, living with him: he keeps a mangle, but is little employed, in consequence of his being less able to give aid in arranging the clothes than the females who are engaged in the same business. The utmost this man will make by his business is a shilling a-week, and that only in the summer months. His wife has found it necessary to separate from him, and go to service at a distance.

Ten persons have 2s. weekly. This seems to be the largest allowance given to an old man or woman who is past work and lives alone. In some instances there are dependent persons, as a sister, a wife, or a husband, also old; but in these cases one of the parties is able to work a little, so that 2s. is judged sufficient for both. In one case we find two sisters, one of them weak in mind; and when we made minute inquiry, we found that both pursue a system of almost open begging, so that probably the parish allowance does not furnish one-third part of their support. Another of these two-shilling pensioners furnishes a curious illustration of the working of the Scottish parochial system. The party was a widow with four children. In consideration of her family, she had at first 3s. weekly. Unfortunately, however, this poor woman became the mother of another infant; in consideration of which delinquency, her allowance was instantly reduced to 2s. Thus, instead of four children with three shillings, she had now five children with only two shillings.

Ten have 1s. 6d. weekly, being generally individuals either not quite disabled, or who live with relatives able to work a little, or who have relatives able to contribute something towards their support. In one instance, we found a woman living with a sister, both of them old, but neither quite worn out. The parish pensioner now and then earns a sixpence by some light labour for a weaver; the other can trim a garden, or keep an infant for a neighbour. Sixpence a-week being required for the rent of their humble dwelling, they have only one shilling certain. Their whole earnings may, on the average, be as much, or perhaps a little more. Oatmeal and potatoes are the staple of their food, but occasionally a neighbour will send them a bowl of barley broth. Thus they live, never from one year to another tasting the slightest comfort suitable to their years and infirmities. Another of these eighteen-pence pensioners is an old widow, who has had a large family, all of whom are now at a distance from her, but unable to give her any aid. Too feeble for any regular work, she is only able to sell some very trifling articles, by which she may realise occasionally a few pence. Other resources, besides mendicancy, she has none. A third of this class is a young woman so much deformed as to be unable to work, though healthy. She lives with a mother who works a little in the fields.

Of pensioners at 1s. a-week there are eight, generally persons of much the same order as the last, but with resources one degree better. One, for instance, is so stout as to be able to sell laces and other little wares in a basket throughout the country: she generally, on getting her 2s. once a-fortnight, proceeds immediately to convert it into a stock for the ensuing fortnight's sale. A second is an old farm-servant, who is partly supported by his children. A third is a widow, who can spin a little. A fourth is an old single woman, who, having a second bed in her little chamber, gets something for its use from a person nearly as poor as herself. Amongst our notes on this class, we find another highly characteristic trait of the administration of the poor's funds in Scotland. It relates to

* A body composed of the established minister and a few elders (lay officers of the church). In every parish there is such a body, forming the first, or lowest, of the ecclesiastical courts of Scotland, and possessing the management of the poor's funds.

Digitized by Google

an aged widow, who is bed-rid from paralysis. She had the misfortune to have a daughter of bad character, whose son, an idle young man, hung about his grandmother's house. So, because of the daughter's character, which she could not help, and because she would not drive her grandchild from her house, she was restricted to an allowance of 1s. weekly, the half of which would probably be required for her house-rent. The authorities have since relented a little, and she has now 1s. 6d. weekly.

Of the only two remaining adult paupers, one has 2s. 3d. and another 6d. weekly, the latter pensioner being a female who only asked so much in order to pay her house-rent. We now come to the cases of children. We find that four orphans, who live with an elder sister, who is able to work in the fields, get 3s. 6d. weekly. One deserted illegitimate child, who is boarded with a poor family, is allowed 2s. weekly, such being the stated allowance in cases of the kind. Another deserted child, who lives with a grandfather and grandmother, who are very poor persons, gets only 1s., which is also the stated sum when the infant resides with relatives. In both cases the parish allows clothes and education. Several other children receive only education from the parish, and it may be remarked that, on this point, there is no want of liberality. A pauper child receives an amount of schooling equal to that received by any of the humbler class of children in the parish.

If there were no poor in the town besides those supplied from the parochial funds, there would be little occasion for remark, except as to the smallness of the parish allowances. Thirty-eight resident and four non-resident cases of pauperism in a town of 2000 inhabitants, would give about one pauper for eleven non-pauper families;* but the poor-roll, in reality, exhibits but a small portion of the poor of this town. There is a much larger number of householders, many of whom are in circumstances equally, while others are in a condition only a little less, necessitous. By inquiry and investigation we have ascertained the actual circumstances of nearly the whole of these parties. It appears, in the first place, that there is a class in great or very frequently recurring necessity, amounting to 63; namely, 22 widows, 17 single women, 4 deserted wives, or women whose husbands at least are unable to do any thing for their support, and 20 men. Nearly the whole of these are aged persons, who have been industrious in their days of strength and health, but are now able only in some instances to work a little at some light labour, while in many other cases the ability to work is entirely gone. Some will have a daughter who works in the fields, and thereby realises tenpence a-day in summer, the main stay of the family. Others will have a small allowance, from some person little richer than themselves, for keeping a natural child. Some, bed-rid and altogether helpless, trust almost entirely to private charity. One or two deal in coal, here an expensive article, which the poor generally buy in a stone at a time. We find, in our notes respecting these sixty-three parties, that only in 13, or one-fifth of the instances, was it ascertained that children grown up and settled at a distance, or any other relations, gave any kind of aid. This is a point on which much misapprehension exists. In that rank of life, children, when they grow up, and go into the world, generally hurry into engagements which preclude the possibility of aiding a sick or aged parent. The girls are less apt to do so than the young men; and it is remarkable that there is considerably greater appearance in these memoranda of poor persons being relieved or supported by daughters than by sons. In none of the cases here adverted to, does the parent find constant shelter in the house of a child. They are all householders on their own account, with only in some instances a daughter remaining to exert herself for the benefit of her parent. It is a remarkable and affecting circumstance, that, in more than one instance, the daughter, thus proving a stay and succour to her mother, is one who originally came as a child of shame.

We have now enumerated 38 resident paupers, and 63 of a class in nearly, if not quite, equal destitution. But these are still not all. We find that in this town there are 86 other householders in very indigent circumstances. The parties in this third class generally possess such a degree of health and strength as fits them for work. Some do work accordingly, when work is to be procured. Others might do well but for intemperate habits. All of them are occasionally in a destitute situation, particularly during the winter season. All of them, as well as most of those in the two former classes, were applicants at a soup-kitchen which was set up during the long-prevailing severe weather at the beginning of 1838. All of them were also applicants for relief from a committee of gentlemen appointed in January 1839, to superintend the distribution of about L.80, which had been collected for the purpose of affording some succour to the poor and unemployed at that season. Thus the total number of poor householders in this town, in 1839, was not less than *one hundred and eighty-seven*, representing about *five hundred individuals!*†

Judging from the memoranda in our possession, we cannot doubt that fully a third part of these families live in great part independently of eleemosynary aid, and only ask assistance under particular exigencies. Still the fact remains broad and palpable, that a *fourth part of the population of this rural town are not, from the comfort of their circumstances, or the delicacy of their feelings, above accepting of occasional charity from public sources.* We feel the force of this fact more keenly when we examine the amount of charity doled out in 1839. This charity, it may be remarked, was given in the form of meal and coal; and the distributions took place between the 16th January and the 23d February, a space of nearly six weeks. The exact sum expended on meal appears, from the account kept by the distributing committee, to have been L.54, 16s.; the exact sum spent on coal was L.18, 5s. 2d., being L.73, 1s. 2d. in all, the remainder having been devoted otherwise. Now, this gives to each family, at each time, only about 2s. 1d. in meal, and rather less than 9d. in coal;† a very small supply for a family during three weeks, and which we cannot suppose that any but very necessitous families would have condescended to accept.

It seems wonderful how so great a number of permanent and occasional paupers should find support in a town so small, of such limited resources, and which, moreover, is infested as much as any other place by vagrant poor. The conviction of our own mind is, that in general the support which these unfortunates do obtain, is very far below what nature requires. One or two slender meals of porridge or of potatoes, with occasionally a little tea, or a bowl of thin broth, form the diet of a day with most of them. It appears a system of protracted starvation. At all times, but more particularly in severe seasons, a large part of the aliment of the indigent class is contributed by neighbours a little better off than themselves. In this town, fortunately, the poor live near the rich. Accordingly, there is no person in tolerably comfortable circumstances who has not a set of dependants planted closely around him. Never does any such person boil a pot of broth, without sending several basins of the mess to as many of these people. Every family which uses tea, has some appointed old man or woman, who comes, after the meal is over, to get the leaves which have already given out the penult of their tincture, in order to go through the mockery of infusing them again, and parading the result with a little barley bread on a poor stool, in front of a fire which appears as if it might safely be held in the palm of one's hand. A great number of women in middle age are employed in field labour, which lasts only during the milder seasons of the year. They get 10d. per day, which barely suffices to support and clothe them during the time when they have work. In winter, accordingly, when there is no work, these women have no resource but charity. But for the broth pots of their neighbours, they would starve outright. Theirs is a well-defined case of occasional pauperism; but the parish does scarcely any thing for them. Of the condition of permanent and extreme indigence to which others are doomed, those who live in the world's more bustling walks can form scarcely any idea. It has hitherto been supposed peculiar to great towns, that there should be hordes of poor people who, when they rise, know not where the food of the day is to come from. But this is a common case in our little rural town also. Some of these people scarcely ever see *white* money. About two years ago, a gentleman sent a small sum to be distributed in weekly sixpences amongst a certain number of poor persons; several of the recipients of this bounty, on the money being put into their hands, said, with tears of thankfulness in their eyes, that they had not had a sixpence in their possession for several years before—a fact quite credible, when we consider how much of the charity of the place is in the form of food. On a similar occasion, a lady, after leaving a little dole with an old widow, having passed in the passage, overheard the poor creature saying in joyful accents to her cat, her sole companion, "Pussy, pussy, we're rich to-night, lass; *I've got a shilling.*" It is wonderful, considering the slender circumstances in which so many people live, that the mortality of the place is not greater than it is. Amongst these regular or occasional paupers, there is a surprising number of aged persons. We can only ascribe the protraction of their lives to the healthiness of the place, their early robust habits, and their exemption from excesses of all kinds. They seem weak in muscle, and thin in blood, and often have severe chronic ailments, such as cancer, ulcers, and palsy; but they are remarkably free from acute diseases, which, after all, are the most fatal to life. It is sad, however, to think of so many weakly and bed-rid old people so inadequately supplied with those necessaries which are perhaps at no time so necessary, and those comforts which are at no time so comforting, as when life is waning to its close.

The decent good behaviour of the great bulk of the extremely poor is very remarkable. Intemperance appears the cause of indigence in only a few cases amongst the families of secondary necessity; in the cases of first necessity, it may almost be described as unknown. In these cases, poverty is simply the natural and unavoidable consequence of surviving the period during which labour gave an independent support. The gains of the parties in these better days having been barely enough to support them, they could lay aside nothing for old age. Their children, generally farm-servants, labourers, or artisans, on scanty wages, having enough ado to support their own young families, can do nothing, or the nearest thing to nothing, for the generation passing away. Pauperism, in such circumstances, is inevitable, if life lasts. These poor persons are, therefore, in general marked by all the virtues which most prominently attach to Scottish humble life. A pious sentiment of resignation and contentment is almost universal. A lady who goes much amongst them as an emissary of a benevolent society of persons of her own sex, to distribute food and clothing where most pressingly required, spoke warmly to us of their quiet virtues, the modesty of their expectations, and their spirit of righteous self-denial. She reports, that often, in the course of her monthly rounds, when she calls on a person whom she knows to be very poor, and asks if any thing be needed, the answer will be, "Nothing this time, ma'am;" and the individual will perhaps point to some neighbour who she is sure *is* in need. There is great scrupulousness as to debt. When one of the eighteen-pence paupers of the parish died in January last, it was found that her rent was paid up till Whitsunday. Another assured us in last April that she had her rent paid up to Lammas. It is common for the parish paupers to allow the kirk-treasurer to retain as much of their allowance in his hands as pays their rent. A grocer, one day conversing with the above-mentioned lady respecting a certain poor woman who lived near by, said he should be glad to give her a little credit now and then, as he was satisfied of her honesty. The lady reported the offer to the poor woman, who, however, declined it, saying that she had once been owing *more than two shillings* before, and had been so distressed about it, that she resolved never to "take on" any more. Our informant also mentioned an instance of the benevolence of the poor to the poor. An old woman who had long been in miserable circumstances, having at length had a pension of five pounds left her by a relation, immediately began to exercise charity out of that little pittance, giving away, for instance, her tea-leaves regularly to a poorer neighbour. So true is Wordsworth's remark—

> "The poorest poor
> Long for some moments in a weary life,
> When they can know and feel that they have been
> Themselves the fathers and the dealers out
> Of some small blessings."

Well, surely, might one of such a spirit "sit by her fire and build her hope in heaven."

Such is the state of the poor in a small rural town in Scotland, under a system of management which has been often represented as peculiarly calculated to *keep down* pauperism, and in contrast with which the English system is believed to be only a monstrous abuse. Out of 101 cases of extreme necessity, an out-door pension, at an average less than half of what is needed to support bare existence, is extended to only 38. There are other eighty-six cases of less or occasional necessity, to which no parochial relief is extended. Forbidden to dream of any thing approaching to a legal title to relief from the holders of the property and the realisers of the profits of the earth, the poor, thus enormous in number, are nevertheless the habitual or occasional pensioners of their more comfortable neighbours. Considerably more than a third—indeed nearly two-fifths—of the families in the town, are so far paupered as to be willing to come forward for a share of what may comparatively be spoken of as a small private charity. It is at the same time found, that only in a few cases out of those described as of great necessity, do the relatives of the parties afford any degree of succour. Surely there must be some strange misunderstanding respecting a system under which such results can be found.

One misconception is very obvious, and it is one which may be said to rest at the base of the system. It takes the form of a dogma that, if the poor are not supplied at all, or at least supplied very scantily, there will be the fewer poor. We might fairly ask, after stating the above facts, if the parish under our notice affords any practical proof of the soundness of this dogma. If we say that, by refusing to admit paupers on the parish roll, we repress *pauperism*, it appears to the present writer that we only affirm an identical proposition; but if we suppose that we extinguish *poverty* and *suffering* by repressing that, its outward and visible sign, the argument is as hollow as it is heartless. We have seen that, although the *paupers* of a small town may be kept below one-twentieth of the population, the *destitution* of the people may so increase and multiply, and so break down their boasted independence, that *one-fourth* of them may be obliged, and may be willing, to apply for and subsist on charitable assistance when they can get it; just as we know that in Ireland, where up to this time there have been no paupers, the portion of the population regularly dependent, during great part of the year, on the charity of the rest, has been not less than one-fourth of the whole.

* From returns, and calculations upon these returns, it appears that the number of individuals in a family in the parish is 4½; consequently that there are 470 families in the town.

* It may be remarked, that we have seen not only the poor roll, but the lists drawn up by the committees of both 1838 and 1839, and have obtained copies of these, together with memoranda of the particular condition of every one of the applicants. These various documents have served as materials for the present paper.

† It is to be observed that only 174 families were supplied. The remainder of the 187 were rejected as "unworthy," by which term, we regret to say, it is not so much meant that the parties were unentitled to relief in point of indigence, as that they were persons of bad character—moral repute being always an important element in the consideration of a poor man's claim in Scotland.

Digitized by Google

But we would also put it to the consciences of men, if such a dogma be, in existing circumstances, either humane or just. In this community, a large portion of the people are constantly engaged, during their better years, in labours which tend to the comfort and enrichment of the rest.* For their labour they get only such wages as barely maintain them, leaving no means of providing for old age. Their inevitable fate, therefore, is to fall into helpless penury. Such persons may be said to be in the same circumstances with soldiers, who, having only such pay as suffices to give them immediate support, require to be pensioned in their latter years. What great hordes of old discharged soldiers would be if left *unpensioned*, these labourers are, without a legal claim to relief. How strange would it seem to hear the dogma announced that, if old soldiers were left pensionless, or endowed with only some mockery of a pension, there would be the fewer old soldiers! Yet the doctrine respecting the poor of the labouring class is exactly the same. It is a doctrine, accordingly, which would reflect burning disgrace upon those who announce it, if it were not that they are utterly blind to its real character.

We have only to notice, in conclusion, a notion very prevalent in the town in question, namely, that many poor people come into it in their old days from the country around. On careful examination, we found this to be the case to a small extent, but not so much as seriously to affect the question. Even, however, allowing for a moment that the country parishes are thus spared at the expense of the town, does it not add just one other inequitable feature to the present system?

A STORY OF THE SEVENTEENTH CENTURY.

In the beginning of the seventeenth century, or, to be more particular, in the year 1616, a shipwreck took place on the coast of Suffolk, before the eyes of a number of the assembled inhabitants of the district where it happened. The evening on which the bark came in sight was a stormy one, and its crew struggled long to avoid the half-seen breakers, or sunken rocks, which threatened them with evident destruction. Most gallantly indeed did the poor mariners struggle, and so long as the light was good they were successful. But the dusk of evening came on, and then the hope of their escape was awfully lessened. By degrees, the bark and its inmates disappeared from the straining gaze of those on shore. The last glimpse which the latter had of the ill-fated vessel, showed the deck crowded with passengers and crew, whose outstretched hands pled strongly though silently for help. Help could not be given, though the unfortunates received the warmest sympathy of those who saw them. Even after all was enveloped in gloom at sea, the people on land remained on the same spot, listening with horror to the howling of the storm, and expecting every moment to hear the sound mingled up with the "cry of some strong swimmer in his agony."

"Can nothing be done?" said a voice in the crowd, the first which had spoken aloud for some time. Every body turned round to the spot whence it came, the people of the place knowing that the sounds came from a stranger's lips. "Can nothing be done?" repeated the same person; "I will give a reward—a large reward for every life that is saved." An old fisherman took it upon him to reply. "Do you think," said he, roughly, "we would have stood idle this half hour, if we could have done any thing to save them? No; I think I know the coast as well as any man hereabouts, or any where else, and I know that no boat could have crossed the *black rocks*—unless bottom upwards." A murmur of assent was heard from all around. "You think, then," said the first speaker, after a pause, "that on these rocks the vessel will perish?" "Too likely, your honour," returned the fisher, whom the light yet permitted to see that his interrogator was a gentleman; "if the ship was once *within* these reeks, something might be done. But *within* them it never will be. What between the sand and the rocks, there is hardly sea-way for a herring-barrel to pass inside." "But, my good friend, there *is* a chance—a slight one perhaps—and you may at least have your boats on the alert." "Please God," replied the man, quietly, "I will be on the look-out. We *may* save some lives. But it will be a full hour ere the moon rises, and till then nothing can be done by man." "Thanks, thanks," cried the stranger, gratified and assured by the firm though quiet tones of the speaker; "I will reward all—all," he continued more quietly, "who will oblige me by receiving it."

In an hour the moon began to give a glimmering light, sufficient to permit the people ashore to glance over the face of the deep to a short distance. Nothing was visible there. A blank expression passed over the faces of the assembled band. But the old fisherman roused them to exertion, and a fishing-boat was put to sea in the little cove formed inside of the rocks alluded to. The wind was not so high as formerly, yet high enough to make the short excursion proposed a matter of danger to the three or four hardy men whom the old fisherman chose to take with him. We shall not attempt to paint the anxiety which followed the starting of the boat, the whole course of which the light did not permit to be seen from land. It returned at length, and with an ominous proof of the doom which had befallen the ship. It brought the body of a man!

The exertions of the stranger already mentioned were instantly devoted to the resuscitation of this victim of the deep. He had the insensible body carried to the old fisherman's cottage, and there used all possible means to restore the vital spark. His attentions were rewarded with success. Ere the morning light dawned, the castaway, a youth of noble appearance, was seated by the fire of the fisher's hut, able to converse with the stranger, and to thank him for his care. These thanks were expressed in good English, though with some peculiarities showing that English was not the native tongue of the speaker.

From the recovered youth it was learned that the vessel, which was an Italian merchantman, had struck soon after the night fell, and had gone to pieces in a quarter of an hour afterwards. He himself had swam for the shore, but had exhausted his powers and lost all consciousness before being taken up. The proofs of his statement were made in part visible by the daylight. Several corses were driven on shore, others were picked up by boats, and the remains of the little bark of Italy were cast on land by inches. The wreck had been an entire and terrible one.

Some time after this lamentable affair, the recovered youth was established as an inmate of the rectory of Hadleigh, the incumbent of which, Mr Petre, had been his preserver on the night of the wreck. The young stranger gave himself the simple name of Theodore, and seemed averse to further inquiry into his name or affairs. But he was so gentle in manners, so intelligent, and so accomplished, that he became as a beloved son to the good pastor. "I was a lonely man," said the rector to him repeatedly, "but heaven has given me a son in pity. You will not part from me, Theodore? I have enough for both." The young stranger replied with warmth to Mr Petre's kindness, but repeatedly mentioned, that he required no pecuniary support—that he would receive means enough to render him independent of all such aid, on corresponding with his friends in Italy.

Mr Petre introduced his new friend to all whom he himself knew, and among others to the family of Mr Balls, one of the principal proprietors of the neighbourhood. This gentleman was of an ancient local house, and proud of his descent from a follower of the Saxon Harold at the battle of Hastings. He had a large family, the eldest of whom was his daughter Mary, a young lady possessed of great personal attractions, and a heart gentle and susceptible. The stranger, so noble in appearance and elegant in manners, made ere long a deep impression on her affections, which was fully reciprocated by the object of her regard. But he was modest and unassuming, and so well knew the difficulties which his position as an unknown castaway involved him in, that, but for an accidental peril which the young lady sustained in his presence, from the unmanageableness of her riding palfrey, the secret might have remained for ever locked up in the recess of his own heart. The danger of the mistress of his affections, however, called forth a passionate outburst of love. It was heard, and responded to, ere the parties concerned could think of aught else.

The lovers met, and met again. "This must not be," said Theodore at length, on one of these occasions; "your father, dearest Mary, must be told all. And yet I fear"—— "Fear!" replied the young lady, "what have we to fear?—you *must* be our equal in *birth*," and she glanced with a look of pride on her lover's manly and dignified form. "Birth! *equal in birth!*" cried he, and for the first time Mary beheld something like pride, or even haughtiness, on his countenance. But it soon passed away, and he said, "I *am* the equal of your father in birth, but circumstances exist which compel me to be so far silent on that point. I have sworn an oath, that to none but the wife of my bosom will I reveal *my name and origin*." Mary became thoughtful at these words, and her lover saw a blush gather slowly on her downcast cheeks. He read its signification as clearly as if it had been told in words. "No, Mary," cried he, "the honour of my mother was as untainted as thine own—as pure as the heaven that overlooks us! But mine has been a strange doom. The welfare of others called from me the oath I have spoken of, and it must be kept. I shall satisfy your father—for ere long I shall have the means—that I am of good and honourable birth, and of means perhaps equal to his own; but my name and family, I have said, must be made known to thee alone—if, indeed, I ever have the happiness to call thee mine."

Theodore did not address himself to Mr Balls until he had communicated with his friends in Italy, and received such credentials as he trusted would remove any objections that the father of Mary might entertain. Lovers look through a magnifying glass at all the circumstances favourable to their wish, but apply a diminishing one to all obstacles and difficulties in their way. So it was in the present case. When Mr Balls was applied to by Theodore, he started at the proposal. "My daughter, sir!" cried he; "my daughter is of an ancient and honourable family. The Balls family possessed this house and property, where we now are, before the conquest of England by the Normans. You must certainly be conscious, sir, of possessing an honourable pedigree to think of such a proposal as this."

Theodore's heart sank within him as Mr Balls spoke. "I am conscious," he replied, "of an honourable descent, and I do not come thus before you without the means of proving it, although I must avouch candidly, and at once, that there are some things connected with myself which I cannot disclose. I will satisfy you, by the testimonials of those whose word ought not to be doubted, that my name is an honourable one, but that name it is not in my power to reveal." Mr Balls gazed at the speaker with a look of surprise. "I might have taken a fictitious name, and have deceived you, but I prefer to admit that there are imperative reasons for withholding my name from all but one person." "And who may that person be?" said Mr Balls, with an ominous sneer. Theodore observed the look, and did not immediately reply. "Surely the person to whom you allude," continued Mr Balls, "must be the head of that house with which you seek to connect yourself?" The young stranger answered, "No, sir; I am bound by a solemn engagement to reveal my name only to her who becomes the sharer of it with me." "That is to say, that my daughter is to wed with one who dare not disclose his name to the world? Can the cause of this be a creditable one? Impossible!" Theodore's heart was too deeply interested in the matter to permit him to take offence at the words of Mr Balls, especially as his reason told him they were founded on a natural feeling. He therefore pressed the father of Mary to look at the letters from Italy, to which he had referred. The other consented, as much from curiosity as from any other motive. The letters were from two Italian noblemen, and were written evidently according to a form dictated by Theodore. The writers stated, that they knew the family of Theodore to be of high distinction, and his birth to be honourable, though there were important reasons for concealing his name and family from the world at large. They also referred to his possession of considerable property, and mentioned other circumstances of a favourable nature.

We do not wish to lengthen our story. Mr Balls declared, that if the register of baptism of the young stranger were presented to him along with these documents, and he were permitted to show the whole to his family and friends, he would be satisfied. This decision he adhered to, and neither the entreaties of Theodore, nor the tears of his daughter, could move him to alter it. On the other hand, Theodore firmly though sadly declared, that such a proposal could never be acceded to by him.

The consequence was, that the young stranger's visits to the house of his mistress were peremptorily forbidden, although Mr Petre, whose confidence in his guest's honour and integrity was unshaken, joined his entreaties to those of the lovers to bring matters to a favourable close. But all was in vain. Can we wonder at the issue? Theodore and the object of his love met in secret, and, finally, they were privately married. The direct reason of this rash step was the confident hope entertained by Mary, that, if intrusted with the secret of Theodore, she might, by the strength of her testimony, reconcile her father to their union. She *did* learn her husband's secret, and such was its nature, in her eyes at least, that it only augmented her love, and increased her pride in him a thousand-fold. But this did not save her from the violent anger of her father, when her marriage was disclosed. "Oh! believe me, dear father," she exclaimed, with tears, "he is one of whom you ought, in every respect, to feel proud!" "Proud!" cried the irritated father, "proud of a nameless wanderer!—my family proud of an union with such as he!" "Yes," returned the daughter, "you will one day be proud of Theodore, and repent of your unkindness." "If you desire me to do so, unfold at once this vile mystery! If not, begone from these walls, and follow the vagrant you have chosen!"

In the little village of Llandulph, in Cornwall, the pair who form the main personages of our story lived for many years after their union, beloved by all around them. They were happy in their mutual affection, though the continued anger of the lady's father threw a frequent damp over the enjoyments of the wife, who made many fruitless appeals for a reconciliation. At length Mary wrote that her husband was ill, and, to increase the evil, had been made so chiefly by the cessation of his wonted communications from Italy. She and her family were now in want. Mr Balls turned a deaf ear to this new appeal from his daughter. To a second of the same nature, he proved equally cold. A third communication, after a considerable interval of time, informed him that his daughter was a broken-hearted widow, her husband having sunk under the pressure of want and its attendant distresses. A portion of the same letter led Mr Balls to go to Cornwall.

The following inscription, engraven on a brass tablet affixed to a mural monument in the chancel of Llandulph church, and still to be seen there by visiters, will show what Mr Balls learnt on his arrival there.

"Here lyeth the body of Theodoro Paleologus, of Pesanio in Italy, descended from the Imperial line of the last Christian Emperors of Greece, being the son of Camilio, the son of Prosper, the son of Theodoro, the son of John, the son of Thomas, the second brother to Constantine Paleologus the eighth of that name, and last of the line that reigned in Constantinople,

* It may be mentioned, that the poor's funds of this parish are chiefly supplied by what is called a voluntary assessment of the land-proprietors, the remainder being derived from the church collections, and other sources. The annual produce of the land of the parish is estimated at L.22,540, and the annual sum contributed for the poor in this manner is about L.229, or one per cent.

until subdued by the Turks, who married with Mary the daughter of William Balls of Hadleigh in Suffolk, gent.; * * * * and departed this life at Clyfton, the 21st of January 1636."

Persecuted by Pope Paul V. and his successor Gregory XV., who hated the Greek line, Theodore Paleologus would have perished in Italy, had not the interference of a powerful friend procured permission for him to retire to England, upon condition of his taking an oath never to divulge his name, that those attached to the imperial house might remain ignorant of the existence of its representative.

"Father," said the widow of the last Paleologus, "I said you would one day repent."

The English squire, whose ancestor had been at the battle of Hastings, did indeed think with sorrowful regret of his conduct to the last of the Cæsars of the East!

A CHAPTER ON THUMBS.

"Say, where's the mighty Thumb, our sword and buckler?
Though 'gainst us men and giants league with gods,
Yet Thumb alone is equal to more odds."

FIELDING, it is but fair to admit, did not intend these words to bear the sense which is sought to be extracted from them here. They occur in his famous burlesque opera, and refer to the son of Gaffer Thumb, the renowned Tommy, whose fate it was to be for a time, as the story tells us, an inmate of the stomach of "a huge red cow, larger than the largest size." But the eulogy of the motto is not less applicable to *Thumb*, the finger, digit, or rather anti-digit, for so it may be termed from its position and uses. This member is somewhat neglected and undervalued at the present day. The ancients, however, evinced a deeper and juster sense of its value. "The Greeks," says Montaigne, "called it *antiheir*, as who should say, *another hand*." In like manner, the appellation by which the member was known among the Romans, displayed a thorough consciousness of its importance. They termed it *pollex*, a word derived from the verb *pollere*, to *bear sway*, to *excel*; thus indicating both its general excellence and its special superiority over the other component parts of the hand. In many additional respects the Romans exhibited in their customs their signal esteem for this important member. The thumb, in the brilliant days of Rome, had life and death at its command. A single movement of the organ, a slight inflexion of its joints one way or another, was the signal of fate to thousands—the forerunner of destruction, or the donor of a new lease of existence. Those acquainted with the customs of the Romans will be aware that we allude to the practice pursued by them at their gladiatorial shows, of deciding whether the unfortunate slaves who then and there hacked and slashed one another for the amusement of their masters, should be allowed to survive the combat or not, by *turning the thumb up or down*. If a gladiator, after fighting bravely either with man or beast, was at last worsted and put at his opponent's mercy, the spectators sometimes interposed to save his life by elevating their hands and turning their thumbs downwards and inwards, and their fiat, thus expressed, was all-powerful to save. If they were displeased, however, with the conduct of any particular gladiator, they almost uniformly condemned him to death by elevating their thumbs, and bending them outwards, and the poor wretch was dispatched accordingly by the weapon of his adversary, or, if that adversary chanced to be a wild beast, was left to perish beneath its fangs, unpitied and unaided. It is in allusion to this practice of the populace at their great spectacles that Juvenal says,

"The vulgar, with uplifted *thumbs*,
Kill each one that before them comes;"

which was their usual way when put into an evil temper by the state of public affairs or other extraneous causes.

The thumb was an equally influential and respected member among many of the other nations of antiquity, whom these polished and merciful Romans called *barbarians*. Tacitus, for example, tells us that certain barbarian kings, when they desired to make a peculiarly firm and lasting compact with any neighbour, were in the habit of joining their right hand with his, and twisting each other's thumbs, or tying them together by a cord; and when, by force of pressure, the blushing blood appeared in the tips, they pricked these with some sharp instrument, and mutually sucked them. This action was intended, no doubt, as a striking emblem of their desire to secure a lasting peace, by extracting the hot and fiery blood from that important member by which alone their hands and arms were made powerful either for offence or for defence. Something like the same mode of making compacts has been practised among all the Celtic and Gothic tribes; and in our own Scotland the custom is scarcely yet extinct. Allan Ramsay, in one of his songs, says,

"Though kith and kin and a' should revile thee,
There's my *thumb*, I'll ne'er beguile thee."

If two bargaining parties respectively licked or wetted their thumbs, and joined the one with the other, the engagement was held to be firm and binding. Decrees are yet extant in the Scottish records, prior to the institution of the College of Justice, sustaining sales upon summonses of *thumb-licking*, the fact of that ceremony having been gone through at the time of bargaining being first established by legal testimony. Indeed, in markets and every place of sale, this custom was prevalent but a *few years ago* among farmers, tradesmen, and almost all parties engaged in traffic. The wet thumb was a token of rectitude of intention seldom falsified, and the man who could break his word, after confirming it by that sign, would have been regarded as one whom oaths could not bind. Another old practice, honourable to the same member, has now become altogether extinct. It is alluded to by Falstaff, when he says, "A plague of sighing and grief! it blows a man up like a bladder. When I was about thy years, Hal, I was not an eagle's talon in the waist; I could have crept into an *alderman's thumb-ring*." Such an article was actually worn by these great civic functionaries in past times, as an especial badge of office and token of high place, and also, no doubt, as a sign of the respect entertained for Thumb.

This quotation from Shakspeare has brought to mind, that on various occasions he exhibits a due sense of the value of the member under consideration. Knowing that upon the helm rests the safety of the ship, that upon the pilot's hand depends the right guidance of the helm, and that the pilot's hand were skill-less and powerless without the thumb, he makes his revengeful wierd-sister say,

"Here I have a pilot's thumb,
Wrecked as homeward he did come,"

as if the possession of that potent member gave her the power of misleading and "tempest-tossing" the bark of the unfortunate "master o' the Tiger," whose chesnut-munching wife had roused the witch's anger. The mighty poet seems even to hint that the thumb is an organ of still greater value among the spiritual people than among men, and endowed with foresight and a peculiar degree of consciousness. How else are we to interpret the exclamation of one of the wierd-sisters?

"By the pricking of my thumbs,
Something wicked this way comes."

It is, upon the whole, scarcely a matter for regret, that the thumb should not possess in this gross world qualities so high as these. The pricking might be annoyingly frequent.

In the times of the persecution in Scotland, those who were selected as torturers knew well how much a man could be injured through his thumbs. Old General Dalzell brought *thumbikins* into use in torturing the poor Covenanters. This instrument consisted of two separate and parallel horizontal bars, with a handled screw above, which moved the upper bar towards the lower one, and crushed the unfortunate anti-digits that might be placed between. The pain given by this instrument was so excruciating, that those who bore all other torments failed to bear this. One victim, by name William Spence, was crushed and maimed by the *bootikins*, or boots for torturing the legs, and was also kept from sleep for eight or nine successive nights. But he continued firm, till his "tormentors (says Bishop Burnet) grew weary of managing this: so a third species (of torture) was invented; little screws of steel were made use of, that screwed the thumbs with so exquisite a torment, that he sank under it." He "desired time, and he would tell all." Principal Carstares was also tortured by the thumbikins, and the very pair which crushed his thumb-bones, and caused his arms to swell to the shoulder, are still preserved. When Carstares was introduced to King William after the revolution of 1688, the monarch is reported to have inquired about the thumbikins. "I will show them to you," said the principal, "the next time I have the honour to wait upon your majesty." Carstares, who had got the instrument from the new Privy-Council of Scotland, was as good as his word. "I must try them," said the king; "I must put in my thumbs here.—Now, principal, turn the screw. Oh, not so gently—another turn—another;—stop! stop! no more—no more!—another turn, I am afraid, would make me confess any thing!" And such was precisely the result in cases of torture. The poor sufferers confessed *any thing*. It is to be hoped that the thumb will never be elevated to the same unlucky pre-eminence, which brought into existence such an article as the thumbikins.

A more commendable employment of this member in past times was that which gave origin to the phrase, "Rule of thumb." It was once a common enough practice in Scotland to measure objects in a rough way by calculating a thumb's-breadth as an inch. Of course no great accuracy could attend this sort of mensuration, and our more precise times apply the phrase jestingly to every case of rude or careless computation. There was a sort of fine assurance of prevalent honesty, however, about the old practice, though it certainly laid buyers too much at the mercy of wily pedlars. Besides, there is a vast difference in the breadth of different thumbs. In other points, also, they vary most materially. The truth is, that thumbs are decided and well-marked characters, as much as heads, faces, or any other portions of the animal frame. Scarcely any two thumbs are precisely alike. Some are elegantly curved at the point, while others are straight as a rush. Some can bend back till they touch the wrist, while others cannot be even slightly inclined in that direction without the greatest pain. On the other hand, some can be curiously bent inwards at the base, while others are fixed there as a rock. There are many other and intermediate varieties. These characters of thumbs are not unimportant, but the reverse. We believe that it will be almost universally found that all the cleverest and handiest carpenters, and, in short, the best tradesmen of every class that make much use of the hands, have thumbs *curved outwards*, and capable of *bending back* at the point. This is decidedly the mechanic's thumb, and the cause obviously is, that the prehension of instruments is greatly facilitated by flexibility of the upper portion of the member. This sort of thumb being by far the strongest variety, is not less advantageous to surgeons. They often require great power and flexibility in the upper part of the anti-digit. We recollect on one occasion witnessing the amputation of a boy's limb, where the *assisting* surgeon, whose duty it was to apply the tourniquet (for stopping the flow of blood in the arteries), on being asked to do so, merely applied his thumb over the seat of the great vessel of the leg, and, by its pressure, checked the course of the blood effectually. This digital strength rendered the use of screw and bandage totally unnecessary. In other cases, the same qualities were often equally useful to the same distinguished surgeon, and it would be well, indeed, if every operator possessed such thumbs.

But it is in *war*, in the art military, that the thumb assumes its true, its highest importance. The thumb makes the soldier; there can be no doubt of that. If there be dubitation on the point in the mind of any one, a cloud of witnesses may be called up to dispel it. Augustus Cæsar is said to have confiscated the estate of a Roman knight who had cut off the thumbs of his two sons to save them from war, and, before that era, the senate put a man named Caius Valienus into prison for life, on account of un-thumbing his left hand with the same view. These cases show at how early a period people acquired a sense of the value of this member in war, but at a later era of the Roman history the same thing was still more fully demonstrated. Laws were issued by successive emperors to prevent thumb-mutilation, yet the practice had become so common in the time of Theodosius, and still with the same view of escaping military service, that the word *poltroon* (*pollice truncus—mutilated in the thumb*), then found its origin as a synonyme for *coward*. The member has not lost its consequence in modern warfare, as any one who takes up Marshall's work on the Enlisting of Soldiers may at once see. In the British army, soldiers have been repeatedly found to cut off their thumbs, or blow them off with fire-arms, to procure discharges and pensions. Very recently, when a regiment was about to embark at Cork for the West Indies, four of the men presented themselves at one time with their thumbs minus a joint. "There was an instance (says the author just mentioned) of voluntary mutilation in the —th regiment not long ago. A soldier attempted to mutilate a thumb, but his courage failed him, and the operation was effectually concluded by his wife. Another soldier, who was at the time quartered in the Dublin depôt barracks, alleged that in consequence of falling forwards upon a fractured glass bottle lying at the bottom of the barrack stair, he had the thumb nearly amputated;" but the cut was discovered to have been made from the back of the hand, and the soldier was found in a lie, and punished. One dragoon swore that his horse had bit off his thumb, but his sword was found bloody, and the trick discovered. Sometimes parties have been known to chop off the forefinger, and sometimes the whole hand, but the thumb is the member most frequently mutilated to produce a disability for war. What an idea this gives us of the paramount importance of the organ! To thumbs we may ascribe the most glorious victories, as well as the most desolating wars of oppression. Without thumbs we should have had no heroes.

Strange as it may appear, thumbs are also essential helps to *oratory*. The most successful legal speaker of the present day, now a lord and a judge, as well as many other noted orators, show how much they depend upon the thumb for aid during their addresses, by perpetually tapping it with the forefinger of the opposite hand. At every tap, no doubt, the thumb gives out an unseen stream of eloquence, electrical, perhaps, in its nature, and of course the more calculated to affect the audience. Another curious and more mysterious use of the thumb is seen in the action of applying it to the tip of the nose, and spreading out the hand from it in a horizontal line. Unquestionably, there is some valuable signification couched under this movement, in which the thumb plays so distinguished a part; but this meaning is usually hidden under some incomprehensible words with which the gesture is accompanied. Talking of the nose, snuffers (we mean snuffing mortals, not candle-polling machines) could not carry on their pleasant amusement for an instant, but for the member we at present delight to honour.

"Betwixt his finger and his thumb he held
A pouncet-box, which ever and anon
He gave his nose."

Thumbs, therefore, have a vital influence, we see, on an important branch of commerce—the tobacco trade.

Digitized by Google

If our readers have not been convinced by all that has been said, of the importance of thumbs to mankind, we can only wish that they may have a touch of whitlow in the organ. If they do not then attain a full sense of its influence over their earthly happiness, we are no conjurors. But it is to be hoped that conviction will be attained without such a trial. As to our present paper, all our hope rests on its being *well thumbed*. If such be the result of the judgment of our readers, we shall be heartily satisfied.

WELLINGTON AND THE PAINTER OF NAPOLEON.

In the whole annals of Napoleon Bonaparte, there is nothing so touching as the fidelity evinced towards him in his adversity by many of those who had shared the good fortune of his earlier days. The time is come when we can look on the career of the wonderful Corsican with some degree of impartiality, and can do justice to such traits of personal devotion as those alluded to, which are rendered the more remarkable by the numerous instances recorded in history of an opposite line of behaviour. Among those most attached to Napoleon, alike in his prosperity and adversity, David the painter held a prominent place. He was the favourite artist of the emperor, and showed, by his pictures of Belisarius, of Socrates, of Brutus, of the Horatii, of the Passover, of Leonidas, and finally of the Crossing of the Alps and Coronation of Napoleon, that, as an artist at least, he well merited the patronage of his master. After the coronation picture, just mentioned, had been finished, Napoleon went to see it in the studio of the artist. The courtiers who were with him, being all of them well acquainted with David, addressed him with congratulations of a very familiar kind on his success. The emperor checked them, observing, in that pointed manner which gave a historical force to many of his sayings, "Gentlemen, be aware that M. David is a *baron of the empire*"—the first announcement which the painter had had of the honour intended for him.

David, as has been said, repaid the favour and friendship of Napoleon with the profoundest admiration and reverence. It may be supposed, therefore, that the disastrous events of 1814 and 1815 were productive to him of unmitigated sorrow. He also suffered personally from the change of affairs, being proscribed and compelled to fly from France. He remained, however, as near its confines as possible, Brussels being the place where he took up his residence. Shortly after the final downfall of his old master in 1815, an incident took place which seems to us to have something affecting in it, and to be worthy of relation.

David continued his artistical labours at Brussels. Indeed, within a few months he collected round him a number of young painters, who sought with avidity his instructions in art. From the stirring nature of the scenes in which he had passed his life, he was enabled to mingle his professional lessons with numberless anecdotes, both personal and historical, and these he always managed to make interesting, in spite of an impediment in utterance with which he was afflicted. He had received this mishap in a curious way. While prosecuting his schoolboy studies, being very poorly provided with money, he was obliged to board with people of the humblest grade; and the wife of his landlord, on one occasion when he was, as she thought, improperly talkative, struck him a smart blow on the cheek with a table-spoon. The consequence was, that a swelling arose on the interior, which lasted through life, and materially obstructed the movements of his tongue in articulation. The matter, however, of the painter's converse made up for all defects of manner. Above all others, Napoleon was his favourite theme, and one of which he never wearied. Fond regret mingled with his recollections of the emperor. Nor did David check himself in his discourse on account of any particular individuals who might be present. Princes, nobles, and other august personages, sometimes visited the painter's studio, and however unpalateable the subject might be, were compelled to listen with patience to David's laudatory reminiscences of the emperor.

The Duke of Wellington, generalissimo of the allied armies, and special inspector of the Low Country fortresses, came to Brussels. Being well aware of the presence of David in the city, he formed the resolution of visiting the artist and getting a portrait of himself executed. With this view he entered his carriage, accompanied by several of his officers, and desired the coachman to drive to David's house, "Rue Fossé-aux-Loups."

On stopping before the little green gate of the painter, the duke and his company were at once admitted. They were shown into a dining-room, decorated in a more splendid way, in one respect, than the halls of monarchs. Pictures, from the hand of David, covered the walls of the apartment, and in almost all of them Napoleon and his deeds formed the subject. In one place he was seen scaling the Alps, in form and appearance the same as when the ancient sides of these mountains echoed in reality to "young Bonaparte's battle-cry." In another place he was seen in his imperial cabinet, dictating missives on which hung the fate of nations. All around the apartment, in short, the English visiters saw the lineaments of their late great enemy.

Madame David was informed by her domestic that an English party sought admission to the presence of the painter, and she went to her husband's studio to know whether or not he would see them. "Yes," said he, in reply to her; "admit them here." Although he said so, however, a change came over his countenance, which indicated that the name of the English was not associated in his mind with agreeable emotions. He was at the moment engaged in painting his fine picture of Eucharis and Telemachus, and it was perhaps to dispel the feeling which had been excited by Madame David's announcement, that, after answering her, he turned again to his task. He had his pallette in one hand, and his brush elevated in the other, when the Duke of Wellington and his attendants entered the studio. David had already become so re-absorbed in his occupation, that he did not turn immediately round; but a movement of the visiters soon made him aware of their presence, and he turned his face to them. Then, for the first time, he saw their uniforms, and knew they were soldiers.

"Gentlemen," said he, bowing slightly, "to whom have I the honour of speaking?"

The chief of the party answered, "I am the Duke of Wellington."

At that name, the old painter—for he was now sixty-seven—grew first red and then pale, showing how much he was moved by the presence of the conqueror of his master and hero. He recovered himself, however, and said, in a coldly civil tone, "In what can I serve you?"

Madame David, who had come to the door of the studio with the visiters, now retired, with some apprehension of a disagreeable scene.

"I was desirous," said the duke, in reply to the artist's question, "to see a painter so celebrated; and as you have painted Bonaparte" ——

"You mean *the emperor*," said David, interrupting his visiter hastily, and reddening with anger.

"Precisely," returned the duke; "and I came to beg that you would execute a likeness of myself."

The old painter looked at the duke fixedly for a few moments, and then, with additional coldness in his manner, he said, "You know that I paint history only."

"Well," returned the duke, with a smile, "I am no personage of romance. You have celebrated with your pencil the features of—this great man," pointing to a figure of Napoleon, "and I, too, am ambitious to be painted by you."

"Sir," replied the artist, with a mixture of emotions legible on his countenance, "I do not paint the English—*I cannot paint the English!*"

David averted his head as he spoke. Seeing the strength of the feelings which actuated him, the Duke of Wellington and his party retired in silence. The duke was evidently disappointed, but he was in all likelihood disposed also, in some measure, to respect the emotions of the old painter of Napoleon. David could not paint the overthrower of his master and friend.

A FEW WEEKS FROM HOME.

CARLISLE—RAILWAY TO NEWCASTLE.

We lately had occasion, in the course of a journey southwards, to pass a few hours in Carlisle, and to proceed thence to Newcastle by the railway which is now established between these two ancient towns. Carlisle is a city of some interest, and enjoys a beautiful situation on a fertile plain about ten or twelve miles from the borders of Scotland, whose blue hills may be seen from it on the northern horizon, while those of Cumberland, amidst which the famed romantic lakes are situated, are equally visible as a south-westerly boundary. Through the midst of this varied green plain winds the Eden, a river about the size of the Tweed, and which, a few miles to the westward, falls into the Solway Firth, whose flat expanse and broad sandy shores are seen from the higher grounds of the neighbourhood.

On entering Carlisle from the Scottish side, and crossing the long stone bridge which is thrown over the Eden, the eye is attracted by the walls and turrets of the old castle, placed on a broad green mound or low hill, which rises from a pretty piece of meadow-land on our right, and flanks the town on its north-western quarter. Excepting the red-stone walls of the castle, still in good preservation, and enclosing some modern erections, and also the massive tower of the cathedral, rising from the centre of the town in front, one does not now perceive any striking marks of antiquity in the place. Formerly, the city was strongly fortified with walls and gates, but these have completely disappeared, and their place is now occupied with rows of villas and streets of modern date and aspect. Although there is no deficiency of stone in the neighbourhood, the town is built of red brick, after the usual English fashion, and it is only lately that an improved taste has introduced a few handsome edifices of yellow sandstone.

Until a comparatively recent period, Carlisle manifested few symptoms of advancement. It was usually esteemed to be a dull old-fashioned place, possessing the dignity of being the seat of a bishop, but without any great trade or traffic to put money in the pockets of its worthy inhabitants. This state of things is mending. For a number of years its manufacturing industry has been on the increase, and now the town may boast of possessing several cotton and other factories, each ornamented with its tall chimney, and smoking away in the most spirited manner. From a cotton-mill of uncommonly large dimensions lying south from the town, there rises a chimney, of an elegant octagonal form, to the height of 305 feet, and which is visible as far as Annan and places more remote in Dumfriesshire. Like most other towns of an improving character, Carlisle, as we were glad to learn, possesses a Mechanics' Institution for popular instruction, which is pretty well supported, though only to a very limited extent by the class of artisans for whose immediate benefit it was designed; of upwards of 200 members, we were told there were only from sixty to seventy belonging to the body of operative tradesmen. In this, however, there is nothing peculiar, as the same thing may be said of every mechanics' institution and school of arts in the kingdom. Lately, a handsome stone building has been erected by subscription shares, for the accommodation of the Mechanics' Institution and Literary and Philosophical Institution of Carlisle. This large edifice had been opened only a day or two previous to our visit, and we had an opportunity of inspecting its large lecturing hall on the occasion of an annual meeting and concert. It is a room of spacious dimensions, calculated to accommodate perhaps 700 or 800 people, and altogether creditable to the town, although the arrangements for lighting are certainly on a mean and defective scale, and a little taste might have rendered it much more convenient in different respects. The want of a lecture-room having been long felt in Carlisle, this, with all its deficiences, will prove of great value to the inhabitants; and we heartily wish that every town of the same size in Britain possessed a similar establishment.

The most gratifying of the local sights in and about Carlisle is that of the railway, which stretches eastward to Newcastle, connecting the eastern and western seas, and passing through a country fifty-six miles in extent, rich in coal, sandstone, and other mineral products. This railway, in its central portion, pursues a line very nearly the same as that of the Roman Wall built by Severus, and which extended from the Solway Firth to the mouth of the Tyne, to protect his conquests in Britain from the northern Picts, but of which no vestige now remains, except a carefully preserved fragment at a few miles' distance from Newcastle. The Newcastle and Carlisle Railway Company was constituted in 1829, but not with a view to using locomotive carriages; these have been introduced by virtue of a more recent act of Parliament. The western termination of the railway is at the basin of a short canal, which extends to the Solway; but passengers and general traffic centre at a principal depôt or station outside the town, on the London road, and near the spot formerly used as the place of execution—the famous *Hairibee*. How strange to reflect on the border rievers who here said their "neck-verse" in the sixteenth and seventeenth centuries, and on the gallant and devoted men who more recently expiated on the same spot their rash efforts in behalf of the exiled Stuarts, and then consider that now the ground forms the site of a railway station! What an altered world we live in!

Driving into the capacious yard of the depôt, we are speedily placed in one of the carriages on the line, and off on our journey, with our face turned towards the east, at the rate of at least twenty miles an hour. The first object of interest on the route is Corby Bridge, a lofty erection thrown across the Eden, both up and down which we have a view of a most beautiful vale, overhung with heavy masses of wood, and dotted over with villages and old structures peeping from amidst the trees. Very near to the bridge, on looking up the river, is seen the old church of Wetheral in the early English style, with its adjacent and aged hamlet. On the opposite bank of the broad and clear running stream, and on the brink of a stupendous woody cliff, is Corby Castle, the seat of Henry Howard, Esq. Both the house and grounds, as well as a curiosity called St Constantine's Cell, are esteemed highly worthy of a visit by strangers. It appears that David Hume visited this part of the country in 1750; and the following lines, written by him on a pane of glass at the Old Bush Inn at Carlisle, were communicated to Mr Howard by Sir Walter Scott:—

> "Here chicks, in eggs for breakfast, sprawl;
> Here godless boys God's glories squall;
> While Scotsmen's heads adorn the wall;
> But *Corby's walks* atone for all."

The train dashing on in its headlong speed, leaves only a moment or two for a glance over this beauteous vale, and soon brings us to a viaduct of several high arches across another valley; thence through cuttings, and along embankments, till we arrive at the most remarkable work on the whole line, called Cowran Cut. From the soft and moist nature of the soil, this hill, it appears, could not be easily tunnelled, and it has been cut sheer down from the summit to a depth of 100 feet by a length of 1500 feet, leaving a gap of about 300 feet in breadth overhead. In the course of cutting the hill, which is chiefly of fine sand, marine shells were found in the centre at a depth of 80 feet from the surface, making it evident that the high ground was only a heap of matter silted from a sea, beneath which this part of Cumberland had formerly reposed. Proceeding onwards, we cross the river Gelt by a skew bridge of great architectural beauty, and looking down we perceive the water tumbling over a rough rocky bed, by the side of ancient quarries. The scenery below is wild and romantic. Amongst the rocks, as we are informed, is one called the "Written

Digitized by Google

Crag," so named from an inscription on the face of it, left, as is supposed, by a party of the Second Roman Legion, who procured from this place the stones used in the erection of the wall of Severus. The line now proceeds across Helbeck Valley, and is shortly crossed by the railway from the coal-pits of the Earl of Carlisle. At about the thirteenth mile-post, and on our left hand side, we pass Naworth Castle, and beyond it, in the same northerly direction, the ruins of Lanercost Priory; both, however, scarcely, if at all, visible from the train, but to those who can spare time, highly worthy of patient examination. This may be called the country of the Howards and Dacres, two powerful families on the western marches. Lord William Howard, warden of these marches in the middle of the sixteenth century, kept 140 soldiers in his garrison of Naworth, and executed prompt justice on the borderers. Under the name of "Belted Willie," by which he was called from a studded belt which he always wore above his armour, he was long held in fear in the neighbourhood. The castle, which has been modernised in many parts, is still in excellent preservation. Lanercost Priory was one of the most important monastic institutions within the English border, and frequently suffered from the ruthless hands of Scotch invaders.

Proceeding onwards a few miles, we are brought to a broken part of the country, with winding valleys and green woody knolls, upon one of which, on our left, and at the distance of half a mile, is situated Gilsland, a rather famous and fashionable watering-place in this quarter of the world. There are several houses for the accommodation of visiters, the chief of which is a hotel or boarding-house of large size, placed at the head of a sloping bank, with a pleasant southern exposure. The mineral waters of Gilsland are various in quality. One contains principally sulphuretted hydrogen with a lesser proportion of carbonic acid; in its solid contents, common salt and soda are the chief ingredients. The other, or chalybeate spring, contains sulphate of iron in a strong proportion, carbonate of magnesia, and sulphate of lime.

Not very far from Gilsland, and also on the north of the line, a house of humble pretensions is pointed out by the name of "Mumps's Hall," being, it is said, the veritable "house of entertainment for man and horse," celebrated in Guy Mannering as the scene of the first meeting between Brown, Dandie Dinmont, and Meg Merrilees. The circumstances in every respect countenance the supposition; for the house was long kept by "Meg of Mumps's Hall," as she was styled, and is placed on the borders of a trackless flat waste, little reclaimed in the present day, and extending northwards to the hills of Liddesdale. The traditional stories related as occurring here, and the wild and reckless characters by which this part of the country was once infested, combined to render Mumps's Hall a place of evil reputation; and as such it must have fallen under the notice of Sir Walter Scott during his visit to Gilsland, where, it may be remembered, he met and became attached to the lady who afterwards accepted him as her husband. In this character it is alluded to as follows, in the Notes to the new edition of Guy Mannering:—

"There is, or rather I should say there *was*, a little inn, called Mumps's Hall, that is, being interpreted, Beggars' Hotel, near to Gilsland, which had not then attained its present fame as a spa. It was a hedge alehouse, where the border farmers of both countries often stopped to refresh themselves and their nags in their way to and from the fairs and trysts in Cumberland, and especially those who came from or went to Scotland through a barren and lonely district, without either road or pathway, emphatically called the Waste of Bewcastle. At the period when the adventures described in the novel are supposed to have taken place, there were many instances of attacks by freebooters on those who travelled through this wild district, and Mumps's Ha' had a bad reputation for harbouring the banditti who committed such depredations. An old and sturdy yeoman, belonging to the Scottish side, by surname an Armstrong or Elliot, but well known by his soubriquet of Fighting Charlie of Liddesdale, had the following adventure in the Waste. Charlie had been at Stagshawbank fair, had sold his sheep or cattle, or whatever he had brought to market, and was on his return to Liddesdale. There were then no country banks where cash could be deposited and bills received instead. The robbers had spies in the fair, by means of which they generally knew whose purse was best stocked, and who took a lonely and desolate road homeward—those, in short, who were best worth robbing, and likely to be most easily robbed. All this Charlie knew full well; but he had a pair of excellent pistols, and a dauntless heart. He stopped at Mumps's Ha', notwithstanding the evil character of the place, and, after a short delay for refreshment to himself and horse, proceeded on his journey. Having proceeded a few miles, he examined his pistols, and tried by the ramrod whether the charge remained in them, and resolved to reload them lest the powder had become damp; but what was his surprise when he drew the charge, to find neither powder nor ball, while each barrel had been carefully filled with *tow* up to the space which the loading had occupied. Charlie now perceived that the landlady of Mumps's Ha' had withdrawn the charge, and he reloaded his weapons with care and accuracy, having now no doubt that he was to be waylaid and assaulted. He was not far engaged in the Waste, when two or three fellows, disguised and variously armed, started from a moss-bog, while other two stout men appeared behind him at some distance. The borderer lost not a moment in taking his resolution, and boldly trotted against his enemies in front, who called loudly on him to stand and deliver. Charlie spurred on, and presented his pistol, but its appearance only excited the contempt of the foremost robber. 'Ay, lad,' said the deep voice of Fighting Charlie, 'but the *tow's out now*.' He had no occasion to utter another word; the rogues, surprised at finding a man of redoubted courage well armed, instead of being defenceless, took to the moss in every direction, and he passed on his way without farther molestation."

Meg of Mumps's Hall, as we learn, lived to the extreme age of ninety-seven, and lies interred in the small churchyard which crowns the height a little farther to the eastward. Having now got beyond the lower vales of Cumberland, and reached the region which intervenes betwixt them and the slopes of the Tyne on the Northumbrian side, we observe a general upland appearance; the country is more bare, the farm establishments are generally on a small scale, and the houses are built of a darkish grey stone, and roofed with the same material, which gives them a poor and cold aspect. Close by a cluster of farm offices of this description, and on the top of a round knoll on our left, we perceive the ruin of Thirlwall Castle, an ancient border keep, and afterwards reach the Greenhead and Haltwhistle stations. Near the latter, the railway enters the flat vale of the Tyne, here a mere rivulet, and, crossing to its left bank, we keep that side of the stream for some time, afterwards cross to the right, and finally cross again to the left near Newcastle. The crossings are by substantial wooden bridges, and in one place in this portion of the line, the railway is carried by a tunnel of 200 yards through a hill which appears to intercept its progress. As we proceed eastwards from this point, the appearance of the country improves, the villages become larger and more numerous, and smoke and tall chimneys begin to show themselves. We are fast getting into a new country. Emerging from the patches of crag and woodland on the south side of the Tyne, the train is swiftly brought into the more open space of ground, near which on our right rises the ancient town of Hexham, the only considerable place on the whole route. Hexham is an old dingy red town, running along the summit of a low eminence, whose sides slope downwards to the plain of the Tyne, and are richly embellished with gardens, the whole being backed by hills to the south and west. In the midst of the houses rises the square turret of the church, one of the oldest in the country. The district around is considered as the finest in any part of Northumberland; the sheltered situation and fertility of the soil render the land available for large crops of fruit and vegetables, which are furnished to the Newcastle market, a distance of twenty miles. The railway has further afforded the means of enrichment from trade and commerce. The town has long been famous for its manufacture of leather, particularly gloves, of which 24,000 pairs are made annually. This branch of trade gives employment to a great number of persons of both sexes, and of all ages.

Shortly after leaving Hexham, the line passes on the north of a fine old ruin called Dilston Hall, once the property of the Earl of Derwentwater, whose accession to the Rebellion of 1715 lost him his fine estates in this quarter, and also his life. A modern mansion for the factor, employed by the Commissioners for Greenwich Hospital, to whom the property was assigned, is now placed amidst the remains of the old edifice. The old town of Corbridge is next seen, on a height to the north of the river. At a short distance another tunnel is penetrated, and a few miles farther on, we pass on our right the imposing remains of Prudhoe Castle, one of the largest ruins of the kind in the country. The walls, turrets, and heaps of fractured building, occupy a large space, on the top of a steep promontory, which communicates with the adjacent grounds by a narrow neck of land stretching towards the south. This ancient and shattered fortress belongs to the family of Northumberland.

After we have passed Prudhoe, the railway gets into a flattish district close by the river, and the dense masses of smoke that encumber the atmosphere, make it quite plain that we have reached the great and busy seat of the coal trade, as well as of divers manufactures which distinguish the lower valley of the Tyne, and of which Newcastle is the centre. Passing the village of Scotswood, we shortly cross the river by an excellent long bridge, and are set down in a depôt on the western outskirts of Newcastle, from which an omnibus carries us to our place of destination in the town.

The journey which we have attempted to describe, occupies three hours by the quickest trains, and four hours by those of a mixed kind. Formerly, before the establishment of the railway, the only public conveyances betwixt Newcastle and Carlisle were a couple of stage-coaches, and these were not always full. Now, there are six trains from each end daily, each train consisting of from four to eight carriages, and each carriage holding eighteen passengers. It is therefore clear that the railway, as is always the case, has created a traffic for itself, and led to a large system of personal communication in this part of the country, on an entirely new footing. But the traffic in goods is also of no mean amount; and here we are called on to observe the beneficial tendency of railways on places coming within the sphere of their operations. The increasing population of Newcastle, and the new sources of trade opening up all around it, call for an increasing supply of food, as well as of sundry materials for manufacturing purposes, produced at a distance. In this trade of supply, the country around Dumfries, and also the north of Ireland, have largely benefited. The rapid transit of goods, by steam-vessels from Belfast to the Solway, and thence by railway to Newcastle, has the effect of causing a continual importation of Irish produce to this busy seat of population. Newcastle, therefore, is now a liberal customer for the pork, bacon, butter, and other articles, produced by the farmers and peasantry of Antrim. As an instance of what is doing in this way, we were informed that one merchant alone in Newcastle, imported twenty tons of bacon weekly from Belfast—a species of trade that had no existence a few years ago, and which could not now be carried on but for the railway, which has connected the Tyne with the western sea. There can be little doubt that, considerable as the trade is, it is still but in its infancy. Newcastle is becoming one of the most populous, as it is already one of the most wealthy, of English seaport and manufacturing towns, and all lines of traffic connected with it will both aid in its increase and enjoy a share of its prosperity.*

SKETCHES IN NATURAL HISTORY.

THE SNAIL.

"It cometh forth in April showers,
Likes snug when storms prevail;
It feeds on fruits, it sleeps on flowers—
I would I were a snail."

The poet Montgomery gives this curt and happy description of the habits of the creature to which we wish the reader's attention to be drawn in the present paper. The snail belongs to the Molluscous division of the animal kingdom, being among those varieties of it characterised by the possession of a head and shelly coverings. With regard to the proper scientific subdivision of this great family to which the snail belongs, it is only necessary here to state, that the animal forms a particular genus (*Helix*) in the *Pulmoniferous* section of the *Gastropods*, two words which indicate the possession of specific respiratory organs, and of a foot, or something serving that purpose, on the under or abdominal region of the body. This, at least, is the arrangement of the naturalist Cuvier. There are numerous varieties of the snail; and these are distinguished from one another by the colours of the shell and body, as well as by other particulars. Brown, grey, green, black, and white species are found in different countries, and in Britain alone many individual varieties exist. They have many characters in common, however; and in speaking of the habits of our indigenous garden-snail (*Helix pomatia*, the type of the tribe), the remarks made will apply generally to a large proportion of the whole family.

The garden-snail is an oviparous animal. It lays a great number of eggs at one time, and hides them in the earth with particular care. They are round in shape, of a white tint, and are attached one to another, by a gelatinous or slimy fluid. At the end of about fifteen days, the eggs are hatched, and the young snail leaves its temporary tenement, with nearly all its members perfected, and with its shell partly formed. Of course this shell is extremely minute; and it consists, at this time, of but one convolution. Its component material is carbonate of lime, deposited in alternate layers with a softer substance, which agglutinates the harder parts together. This can be shown by dissolving the carbonate of lime in muriatic acid, when the softer matter is left alone. The soft outer skin of the animal, commonly called the mantle, deposits or excretes the shelly covering. In explanation of this curious point in natural history, we may quote Dr Roget:—"If a portion of the shell of a living snail be removed, which can be done without injury to the animal, since it adheres to the flesh only in one point, there is formed, in the course of twenty-four hours, a fine pellicle, resembling a spider's web, which is extended across the vacant space, and constitutes the first stratum of the new shell. This web in a few days is found to have increased in thickness, by the addition of other layers to its inner surface; and this process goes on, till, in about ten or twelve days, the new portion of shell has acquired nearly the same thickness as that which it has replaced. The calcareous matter which exudes from the *mantle* is at first fluid and gelatinous; but it soon hardens, and consolidates into the dense substance of the shell."

In this manner does the young snail effect the construction of its shell, or rather enlarge the calcareous speck previously formed in the egg. It is the point or peak of the shell which is there formed. The animal afterwards deposits its shell *laterally*; but if it were to do so to an equal extent on all sides, it would obviously shut itself up in a long, straight, and rounded case. In consequence, however, of the heart and great blood-vessels being situated on the left, that side of the mantle is more active than the right side, and hence much more matter is there deposited, compelling lateral turns to be progressively made in the *contrary* direction, or towards the right, and "giving rise to a curve, which is continually changing its plane, being

* For some particulars respecting the places on our route, we have been indebted to "The Railway Companion." Scott, Carlisle; 1839.

Digitized by Google

converted from a spiral to a *helix*, a term of geometry borrowed from this cause from the Latin name of the common snail." That this is the cause of the peculiar shape of the snail's shell, is made apparent by the fact, that in those mollusca which have the heart on the *right* side, the turns of the spiral are made to the *left* or contrary side. Hence the terms of dextral and sinistral shells, or right and left ones. The shell of the snail, it may also be mentioned, is usually called an *univalve*, from its being of one continuous piece; the shells of the oyster and cockle being called *bivalves*, from being of two pieces. The term *turbinated*, expressive of the spirality of the shape, is also applied to the shell of the snail. There are usually four and a half rounds or circumvolutions in the shell of the common snail.

So much for the ordinary calcareous case of the snail, and the very remarkable yet simple cause which gives it that spiral form so well calculated to render it a secure and comfortable lodgement for the possessor. But the shelly provisions are carried still further, and it will be proper to notice this point also at present. We are to suppose that the animal, during the completion of its shell, is gradually attaining its full bulk, a circumstance which naturally causes that extension of size visible in the under part of the testaceous covering. Having enjoyed its first season of summer, the garden-snail is endowed with the power of ensuring additional warmth and comfort to itself during the winter, when its shell must lie buried in snow. It constructs partitions or doors, partly membranous and partly calcareous, which extend across the whole aperture of the shell, and render the interior perfectly close. It is remarkable in how short a time the animal will complete these new coverings when circumstances occur to urge their completion. When the snail feels the returning warmth of spring, it forces off these doors by secreting a mucous fluid which loosens the adhesion between them and the shell. It reconstructs them when occasion again requires their presence. These are the principal natural processes connected with the shelly covering which the snail goes through. But accident sometimes calls for novel exertions. It can not only make its shell, but it can also mend it, and this to an extraordinary extent. Sometimes the shell is crushed seemingly to pieces, yet the animal will set to work, and in a few days repair all the breaches that have been made. The matter forming the patches is the same with the original shell, but the junctures are easily discerned, having a fresher colour than the rest, and giving it the appearance of a coat of many darns. Swammerdam proved that the snail, when robbed of its *whole* shell, could not reproduce it. It made attempts to do so, in the instance of his experiment, but failed, and soon died.

The soft body of the snail is attached to its shell, at the part called the pillar, by a strong and complicated muscle, which partly shifts its place with the growth of the animal. In the interior of the body, the chief parts to be noticed are the lungs, forming a single organ on the right side, and the heart, occupying the left. The rest of the body is filled chiefly by the digestive and intestinal organs. The body is long, and rounded externally. The most remarkable organs there situated are the horns, of which there are four, two large ones superiorly, and two smaller and shorter ones inferiorly. All these are seen distinctly when the animal is in motion, but the uppermost ones are those which chiefly deserve consideration, as well on account of the motions with which they are endowed, as because the *eyes* of the animal are situated at the extreme ends of them. These organs have the appearance of two blackish points. When examined apart from the body, they are found to have a bulbous or turnip shape, and have one coat. Some naturalists assert that the horns actually fulfil the purpose of a *telescope*. Dr Roget, an excellent authority, countenances this view. In addition to these telescopic advantages, the snail can bend its horns, and direct the eyes to different objects at pleasure, by a regular motion from muscles attached to the body; and when alarmed, it can retract and hide the horns in the soft integuments beneath. Under the small horns is placed the animal's mouth. This organ is furnished with broad lips, and is supported by an internal cartilage, having teeth or tooth-like projections upon it, eight in number, with which it cuts its food. The only other point worthy of notice in the exterior of the body is an aperture on the right side of the neck, which at once serves for the expulsion of the excrementitious matter from the body, and acts as an opening for the inhaling of air into the lungs. By the same passage, also, the eggs of the snail are emitted, when they are to be deposited in the earth.

In the season of heat and vegetation, the snail, with its body protruded from the shell, moves from place to place in search of food, carrying its house behind it. It effects its locomotion by alternately contracting and expanding the broad muscular region forming its belly, and usually though erroneously called its foot, exuding every where a slime, apparently for the purpose of facilitating its movements. The manner in which the creature attaches itself firmly to a stone, a wall, or any other object, is one of the most interesting parts of its economy. Nature has given it no claws or limbs wherewith to hold to objects; but like limpets, and all other animals of this tribe, it can attach itself securely by merely forming a vacuum betwixt itself and the object against which it is placed. Thus, the poor despised snail performs an elegant pneumatic experiment as effectually as could be shown by the most complete air-pump apparatus.

The snail is very voracious, as well as delicate in its choice of victuals. These consist of the leaves of plants and trees, which the animal eats in such quantities as greatly to trouble the repose of the respectable members of society who take care of our gardens. It is in the first fine days of April that the snail breaks down the door of its shell, and issues forth for the enjoyments of the season. We may suppose that its long winter fast is in part the cause of its gluttonousness at this moment. It at first takes any thing that comes in its way; every species of green vegetable seems to be welcome; but the appetite of the creature becomes in time so far appeased as to permit it to search for the most succulent plants of the garden. In almost every season, the juicy pulse is more or less destroyed in this way. Wet weather brings forth the snail in greatest numbers. Probably, one reason for this lies in the comparative ease which the dampness gives to its locomotion. When the cold season arrives, the snail, as has been mentioned, betakes itself to some snug retreat, often in company with several others of its kind, and, having closed up its shell, passes the winter in a state of torpidity. Some naturalists say that the creature makes its partition-door porous enough to admit air, but this is doubtful, and in some measure unnecessary; as we know that several animals which breathe in summer the atmospheric air, hybernate without exercising their pulmonary organs.

The eyes of the garden-snail have been described. The arrangement of the other senses is not so well understood. Swammerdam concluded, from various experiments, that the creature possessed the sense of smell, and there can be little doubt that it also enjoys the sense of taste; but an organ of hearing is almost unknown among any of the mollusca. Every individual snail brings forth eggs, although intercourse with others is requisite for their production. Another remarkable feature in the tribe is their power of reproducing parts of their bodies, when these are cut off. If the head of a snail be amputated, the whole of that part of the animal, including even the telescopic eyes, and the other organs of sense, will be reproduced in a wonderfully short time.

These are the most striking particulars relative to the natural history of the garden-snail, and its immediate congeners, which form the class of proper terrestrial *helicidæ*. There are other members, however, of the molluscous family, approaching so closely to the land-snail tribe, as to deserve a passing mention here. Garden-snails, though fond of damp, perish in water, when they fall accidentally into it; whereas the other varieties alluded to, though resembling the garden-snail in their shells, and in the general arrangement of all the important organs, are fitted to live altogether or nearly so in the water. The fresh-water snail, for example, lives in pools, being furnished, in some cases, with a peculiar contrivance by nature, for rising to the surface, or sinking to the bottom. The manner in which this is performed is by opening and shutting the orifice or tube in the neck, by which respiration is accomplished. The creature can so protrude and dilate this tube, and so fill its lungs with air or empty them, as to render itself specifically lighter or heavier, that it may swim or sink, as the case may be. When the tube is stretched, its edges are bent over and spread so as to rest on the water, and give the creature something to hang by. It is a remarkable peculiarity of the common fresh-water snails, that they are viviparous, not oviparous, and bring forth their young not only alive, but with shells on their backs! Swammerdam found, in one parent snail of this species, nine young ones, fully formed in the manner mentioned.

Many molluscous creatures of the sea, also, bear a close analogy to land-snails in their formation and habits. The genus Janthina, for instance, are usually termed oceanic snails. They contrive to float or sink by means of cells, which they can fill with or empty of air at will. As one of the best examples, however, of the manner in which nature contrives to make a creature like the snail exist in the ocean, some notice may here be taken of a different tribe, though modern naturalists have abolished the use of the generic name in their case. We allude to the Nautilus, which resembles the land-snail in many points, but has the additional provision of tentacula or feelers attached to its head, or rather has the rudimental horns of the land-snail more fully developed. "The shell of the Paper Nautilus (says Roget) is exceedingly thin, and almost pellucid, probably for the sake of lightness, for it is intended to be used as a boat. For the purpose of enabling the animal to avail itself of the impulses of the air, while it is thus floating on the waters, nature has furnished it with a thin membrane, which she has attached to two of the tentacula, so that it can be spread out like a sail to catch the light winds which waft the animal forward on its course. While its diminutive bark is thus scudding on the surface of the deep, the assiduous navigator does not neglect to ply its other tentacula as oars on either side, to direct as well as accelerate its motion. No sooner does the breeze freshen, and the sea become ruffled, than the animal hastens to take down its sail, and quickly withdrawing its tentacula within its shell, renders itself specifically heavier than the water, and sinks immediately into more tranquil regions beneath the surface."

It would be improper to extend an article so general in its nature as this, by endeavouring to describe and distinguish the numerous varieties of the *helicidæ*, or by including others of the aquatic mollusca, merely because they bear an affinity to the snail. The proper bounds of our article have been reached. In conclusion, therefore, we have only to observe, that snails are not a race of much direct value to man. Both land and water snails have been, and are still occasionally, used as articles of human food, but not extensively. The terrestrial snails, however, form articles of diet to birds to a large extent, and we often find their shells drilled with holes by the agency of worms. The latter, it is probable, after thus breaking the house, do not spare the tenants. Seeing that man is too apt to pass over such creatures as the snails, as not possessing characters entitling them to much attention, we may, before closing our sketch, quote Goldsmith's sensible remarks on this point. "Snails appear to an inattentive spectator (says he) as mere inert masses of soft flesh, rather loaded than covered with a shell, scarcely capable of motion, and insensible to all the objects around them. But when viewed more closely, they are found to be furnished with the organs of life and sensation in perfection; they are defended with armour that is at once both light and strong; they are as active as their necessities require, and are possessed of appetites more poignant than those of animals that seem much more perfectly formed. In short, they are a fruitful and industrious tribe."

A GLASGOW DINNER PARTY OF THE LAST CENTURY.

[The following sketch may be considered as a very suitable companion to that presented in last number from the clever novel of "Ingliston." It is abridged from a new and enlarged edition, now publishing in numbers, of an amusing little work, entitled "The Laird of Logan, or Wit of the West." The hero of the scene is this same laird from whom the book takes its title, a rattling sharp-witted Ayrshire gentleman, who flourished during the latter half of the last century. As a picture of the manners of that age, and to all appearance a faithful one, the sketch may be said to possess a historical value, not to speak of the whim and drollery with which it abounds.]

THE day was one of intense cold; the frost during the previous night had been uncommonly severe; every house, whether thatched or otherwise, was thickly covered with a hard coating of frozen snow, from which depended long spikes of ice, glittering in the feeble rays of the sun like reversed bayonets at a soldier's funeral. The Westport well, and indeed every well in town, had an irregular train of silvery-looking icicles hanging from the spout, long and flaky, and such as the children in some parts of Scotland call the tail of John Frost's grey mare. It was on this day that a select party had made a paction to dine together in the Saracen's Head. This inn was then considered the chief house of entertainment in Glasgow, and the most fashionable resort of the nobility and gentry of the west of Scotland. Here the magistrates held all their convivial meetings, which, on extraordinary occasions, was made known to the public by the fact of two town-officers with their halberds taking post as a guard of honour at the door. The Lords of Session, also, in going the circuit, always made the Saracen's Head their place of sojourn. The house no doubt was well kept, and the gaucy, good-humoured, rattle-tongued landlady, with her rosy haffets, and large laughing brown eyes, was to many no small part of the attraction, though she laughed too much, and often out of place; but where a woman has good teeth to show, this will always happen. Yet, though Mrs M'Millan was at times rather forward, and took great liberties in the way of joking with her customers, she was in the main a frank, furthy, kind-hearted, good sort of woman.

The party kept their time pretty well, and consisted of nearly a dozen. Among these were, young Sillerknows, the Laird of Auldgavel, Doctor Seggie, who came in a chair, with his little French cocked hat under his arm, as black and glossy as a new-feathered crow, while his coat was covered with hair-powder, that had fallen from his head almost to his pouch-lids. The doctor, who was a fat, little, round-about looking man, was rather particular in the matter of dress, and on this occasion, besides an abundance of frills at his breast and hands, displayed between his waistcoat and the adjoining portion of his habiliments, a bulge or roll of linen, of the finest texture and the most spotless purity. This seemed to be regarded by some of the company as proceeding from vanity in the doctor; others imputed it to the rotundity of his figure preventing him from keeping the parts of his dress so close together as he might otherwise have done. There was also present a very odd-looking young man, who had been amusing himself through the day by skating on the river, and was brought to the party by Logan of that ilk; he was dressed in a long red coat, buckskins, and boots; his face was completely overrun with marks of the small-pox, while his nose was all drawn to one side of the face, and his mouth, as if from affection, appeared to have followed in the same direction. * *

While waiting for dinner, the company drew all as close round the fire as possible, and the conversation soon became very animated on the state of the weather. One declared he had seen a Highland officer slide on one foot from the top of the Drygate to the bottom, and that, when he stopped, he found the foot he had held up so firmly frozen to the bottom of his kilt, that he had to hop all the way to his lodgings. Another had seen two married ladies fall into an open part of the river, and, in consequence of their clinging to each other after they were got out, they became so completely frost-locked, that their husbands had to get them carried to a house to have them thawed, so that each might have his own wife again. * * * "These are very freezing stories, gentlemen," said Dr Seggie; "but without any joke, it is certainly very cold, and I don't see how we are to manage to take our dinner unless we get warm plates to eat it

off." "Warm plates!" exclaimed several voices. "Yes, gentlemen," cried the doctor, "it is not uncommon in the south to have them in such weather, and I don't see why we should not have them here." "Warm plates for Scotsmen! a man's stomach maun hae come to a pour pass when it canna warm a dinner for itself," said Logan, "but let every man have his humour—here's the landlady, you can tell her about it, doctor." "Mrs M'Millan," said the advocate for comfort—"the day is so very cold, that we fear we will not be able to eat our dinner." "Not be able to eat your dinner!" screamed the jolly dame, with a loud guffaw which interrupted the doctor's preamble. "Now, that beats a'! our gudeman and me, and, indeed, every one about the house, eat more in this weather than they do in the heat of summer. I declare every jaw in our kitchen is gawn as if it was for a wager." "Mrs M'Millan," said the doctor, in a tone of greater solemnity than the occasion called for, "it is not the conduct of your kitchen people that is the matter in hand—have you any objections to give us warm plates to eat our dinner off?" "Warm plates!—did ye say warm plates, Dr Seggie? Weel, I've keepit a house this mony a year, and I never heard o' warm plates to a hot dinner before." "Then you refuse to give us them?" "By no manner o' means, Dr Seggie, so you needna lift folk before they fa'; you're welcome to any plates you please, and a' that I have to say is, that the longer a body lives they see the mae fairlies." "But is the dinner ready, Mrs Mac.?" "Deed is't, Auldgavel, and served up in the magistrates' room. Every thing's ready but the plates, and they'll soon be warmed, if I thought ye wasna making a fule o' me." "Woman," cried Dr Seggie in a pet, "we neither came here to make fools, nor to be made fools of, so get the warm plates momently, or I, for one, will leave the house." "Sweet keep us a'," cried the good-humoured hostess, "there's a storm in somebody's nose, light whar it like—but dinna be in a hurry, doctor, we'll mak' ye a' right belyve—you've gotten a warm temper, and you'll get a warm plate, an' I'll warm a bottle of water to put to your feet, and you'll get a warm brick in a nice clean warm towel, to sit on, and if a' that does na mak' ye comfortable, my certie! ye maun be ill to please." So saying, Mrs M'Millan wheeled off, with a loud laugh, to attend to her duties in the kitchen, leaving the doctor fretting and spluttering with anger, like a sausage in a frying-pan.

"Weel, gentlemen," said Logan to the company, who had now mustered in the magistrates' room, "here's a goodly set out, and I propose that Dr Seggie take the chair instanter." "I'll take no chair in this house to-night." "What! You don't mean to take your dinner standing?" "I mean what I mean, and I'll either sit or stand as I see proper." "Weel, weel, doctor, if you're in that bow-wow-humour, we must just get somebody else; come awa, Auldgavel." "Na, na, I ken nae better chairfu' than yoursel, laird, so sit down and tak' your frien' wi' the red coat here up beside you, and nae mair about it, for the dinner's cooling—and if you've nae objections, I'll face you mysel." "That's the thing, at last—come up to my right hand, Bob. By the bye, gentlemen, I should have told you before, that this is my frien', Mr Robert Hornshottle, of Howlet's howf, and likely soon to be of some other howf, if he plays his cards right. But here's the warm plates; hand them down to Dr Seggie, he's nearest the haggis." "There has been too much said about warm plates already; besides, I don't like haggis." "Will you take some hare soup, then?" "No." "Then say what you'll take yourself, doctor." "I'll take some of the beef in front of you, sir, if you can assure me of its being well pouthered." "I can only say this, doctor—that Mrs M'Millan's cook and your barber seem to be the best hands at poutherin' beef I know, and I think what I'm going to send you is off a bit of as weel pouthered beef as yourself." "Sir, I don't understand you; if I'm powdered, I'm the more like the company; but I won't be called nicknames by you nor any man, sir; no, sir, no man shall call me powdered beef with impunity." "Hand that to Dr Seggie. I'm thinking, doctor, you'll find that very excellent pouthered beef, although, like yoursel, it seems a wee thocht short to the out." "I'll have none of your beef, sir—you wish to make me the laughing-stock of the company, but I won't be made a laughing-stock by you, sir, nor any man, sir." "Weel, weel, doctor, see if you can get any of your neighbours to take it." "See to that yourself, sir," cried Seggie, turning his back pettishly on the chairman. "No offence, doctor—but I thought, as you were rather more in the powder way than myself, you would have a better chance for a customer. Do you say pouthered beef, Sillerknows?" "I do, if Auldgavel will help me to some of the breast of that turkey at his elbow." "I'll do that, and you'll find the turkey a great improvement, for I fear Logan cut for the doctor off a part that was rather salt." "Why, gentlemen, I don't know what to do with our frien', the doctor; I've tried him with haggis, and hare soup, and pouthered beef." "Sir, I want none of your attentions." "But I will attend to you though—and every one in company—while I fill this chair—so look around you, doctor, and see if there's any thing to tickle your fancy. There's a fine young goose, plump, crisp, and tender, wi' a pudding in its gebbie, and apple sauce at his side, like a weel tocher'd lass, and no courting required, doctor, but just put forth your hand, and help yourself. There is also a peerless-looking pie, covered with a paste that might tempt a bishop, and I'll warrant its inside is as rich as the mines of Potosi—so, doctor, if you're inclined to dig, you'll find your excavations well worth your trouble. Then, again, there is a dish of partridges, each reposing on his soft luscious downy bed of savoury toast, and holding up its claws as if imploring your attention. I declare, doctor, you must have a heart of adamant if you can resist such seducing supplicants. And look you here, my learned and fastidious friend, here's a brace of blackcock sending forth a fragrance that might put to shame the most costly incense that ever rose from the altars of the Romans. I would give you a Latin quotation on the subject, but you all know, gentlemen, that Latin with me is something like Dr Seggie's hair powder; it could get ony where but through the skull. That's right, doctor, tak' to your warm plate and help yoursel." "That's just what I mean to do," cried Seggie, breaking out into a laugh in which the company joined; "you're a tormenting humbug, Logan, but it's of no use to be angry with you. Two or three times to-night, had I been near you, I could have run my knife into you." "Ay, ay, but I hope you'll run it into something that'll do you more good. And now, doctor, suppose you and I should ha'e a glass of brandy together." "With all my heart; but really, laird, I was angry." "Man, muckle ye had to be angry about; if ye heard the hecklings I get frae my friends, you would wonder sometimes how I keep my senses. But I hope, Auldgavel, you're keeping a' their beards wagging in your quarter. Come, Sillerknows, help yourself and Middlemains to some of the pie before you; you'll find it good; Mrs M'Millan is a noble hand at a pie; but speak o' the deil and he'll appear—here she is with the venison." "Yes, laird, and I've brought some more warm plates, for I thought if ony thing needed them it would be the venison, though it's just piping frae the fire, and the fat's a' quivering about it like jeelie." "You're a sensible woman, Mrs M'Millan; set it down before me, and I'll soon show you a roomfu' o' lip-likers. The very smell o't's a cordial; come, gentlemen, while 'am preparing the delicacy for you, you can be washing your throats wi' a glass o' wine; I declare the flavour o' the heather that's about it might give fragrance to a ball-room, even though all the beauty and fashion of the country were in it. May I trouble you, Mrs Mac, to hand that to the doctor, he's got but little dinner yet." "Deed that's true; I've seen the doctor mak' a better dinner aff a caulder plate." "I've seen that too, leddie, and am sorry I said some angry words to you that there was no occasion for." "Ah, doctor, dinna let that trouble you; we in a public line maunna heed words. Words are but wind, they break nae banes; you were a little warm, nae doubt, but, as our cook says, a 'little pot is soon hot.' If you were as tall as Logan there, or even mysel, the heat would be langer o' getting to your head." So saying, with a loud laugh, in which the doctor and the company joined, the landlady made her exit, after which the duties of the table proceeded with silence and celerity, till the chairman, before drawing the cloth, proposed a glass by way of drinking the dredgy of the gallant fat buck they had helped to discuss. "And I propose," cried Auldgavel, "that we include the no less gallant brace of blackcocks." "I object to that," said Logan; "they must have a glass to themselves, for I'm sure, like the gallant buck, they both died game." "Ay, ay, Logan, there's no use in talking to you, for you must always have your pun. But, by the bye, Middlemains, can you tell me what's come o' Neapknows, I expected to have seen him here to-night?" "Did you no hear? He has been sequestered at the Court o' Session, and the Lord Ordinary, for some reason or other, has refused to dispense with the penalty of wearing the harlequin stockings; so he's rather shy of being seen out."* "That'll make him look to his feet." "At least, Auldgavel, it will make other folk look to them," cried Logan; "and, my certie, but I think the Lord Ordinary has gien him owre the shins, wi' a vengeance." "Yes! his lordship has been rather sair on his shins." "But, tell him frae me, Middlemains, to keep up his heart, for his shins will do as weel for leg bail as ever. By the bye, gentlemen, that puts me in mind o' a story of a dice-rattling neighbour o' mine, Peter Hosie o' Warlockscroft. He was a farmer, a drover, a horse-couper, a smuggler—in short, he was every thing, and you'll always see that the man of many trades thrives by none. Peter at last fell into the same scrape as frien' Neapknows, and, as his character didna stand high in the court, naething could be done about the stockings; so, some time ago, he threw a plaid about him, and came over to me, under the cloud o' night, to ask my advice, for he was engaged as best man at his niece's wedding. Now, you ken, gentlemen, that the harlequin stockings, as our friend Middlemains ca's them, are not the most becoming covering for the legs of a best man. Weel, I heard his complaint to an end. 'Go away home, Hosie,' quo' I; 'I'm to be at the wedding the morn, as weel as yoursel; dress out in your best, and be sure to comply wi' the act. Put on the stockings, by all means, and just wait in the house till I come for you.' Weel, next day I mounted my beast, and when I got to Hosie's, I found him a' ready, but sair down in the mouth, poor man, about the showy state of his legs. So, I puts my hand in my pouch, and tak's out a pair o' braw wide stockings o' my ain. 'Hae,' said I, 'draw on thae over the Lord Ordinary's, and let me see wha dare find fault wi' your shanks.' 'Laird,' said he, after looking in my face awee, 'that's cute.' 'Cute,' said I; 'you a horse-couper and didna think on the like o' that.' Now, Middlemains, tell your friend just to tak' the same plan: for though the act compels a man to wear party-coloured hosen, it does not, in cold weather like this, prevent him from taking care of his health, by drawing on a more comfortable pair on the top of them." "Logan, you ought to go back to Edinburgh, and take to the law. It's a shame for a young fellow like you, to be spending the prime of his life among a parcel of country horse-coupers." "Gang back among the Edinburgh lawyers! I can tell you, Auldgavel, that I'm a little particular about my company, and I wish to be where there's at least the chance of meeting wi' honesty. A horse-couper may be honest, were it only by mistake; but a lawyer, never—na, na, it's not considered professional to make mistakes of that kind." * *

Before the claret was fairly disposed of, the company had got into a pretty jovial humour. The chairman had sung "John o' Badenyon," Dr Seggie had given the "Jovial Tinker," and Sillerknows was roaring at the top of his voice "My father was born before me," when a capacious bowl was placed before the chairman, supported by a bottle of rum on one side, and a bottle of brandy on the other. "Now, gentlemen," cried Logan, "while I'm making up a bowl of matrimony for you, let us settle about breaking up. I have to dine at Eglinton house to-morrow, so I must make an early start." "Then I propose that we leave this when the waits come round." "And I propose," said Auldgavel, "that we get the waits to play before us all the way home. It's clear moonlight, and there's a meeting of the Pech-Club in the Black Boy to-night, and I would like to go past like ourscls." "My good friend," said Middlemains, "I fear by the time the waits come round, we'll no be so very like ourscls as you think, and as banes in frosty weather are said to be frush and easily snapped, so, in case some of us happen no to be so able to keep our feet, I propose that we tell the landlord to provide chairs for all except Dr Seggie, who has got one already, and that we all take to our chairs in the trance, and fall in in single files behind the waits, and I think that'll make a very decent set out gaun up the Gallowgate, on a night like this." The company were quite in the humour to relish any whimsical proposal: the above of course received a most hearty acquiescence.

"Weel, gentlemen," continued Logan, "since that's settled, my right hand neighbour will ladle out the drink till I go down and arrange wi' the landlord, so that there may be no mistake about it." So saying, Logan slipped from the room, while Auldgavel shook his head impressively to Sillerknows. "Do you think so?" "I'm sure of it; I know the youth." "Sure of what?" cried several of the company. "That Logan's away down to settle the reckoning." "That'll no do, we must speak to him." "You may, gentlemen, but it's of no use; we must take our revenge another time."

On Logan resuming his seat, the company began, open-mouthed, to rate him for the liberty he had taken, to all which he listened with the greatest patience till he was expected to reply. "Gentlemen, fill your glasses, and I'll give you a toast: 'May we always do as we ought to do.' You took the liberty of conferring upon me the honour of being your chairman, and I merely took the liberty of adding to that honour, by making you my guests. If I have done wrong, it was yourselves that set me the example. I have no other apology to offer; so here's wishing you all a merry new-year when it comes." "Ah, Logan, Logan, you're the old man, I see, and there's no use talking to you; so, here's wishing you may spend the coming new-year as merrily as you did last." * * * The conviviality of the evening, or rather the morning, had by this time reached its height. The company broke out into a grand Dutch medley, after which, a straggling fire of verses was faintly kept up by a few of the party, while the heads of some of the others began to droop. They had all drunk hard, owing to a vague impression they had of an early adjournment, as hinted by the chairman, who, it must be acknowledged, began to look drowsy himself. The house became gloomy and silent, and the lights, from want of attention, had waxed dim. The landlord now made his appearance to announce that the chairs were all come, and the waits in the kitchen. On hearing this, Logan rubbed his face, and started to his feet, like a giant refreshed, to help mine host to rouse his companions, and get them all settled in their chairs. "Remember, M'Millan, that I bring up the rear, and follow Auldgavel's chair, for I take my bed with him," said Logan, as he laid hold of the wait, to arrange with him about the starting music, which was agreed should be the favourite old air of "We're a'nodding," as being best adapted for the chairman's trot. On falling into a line, one of the chairs was found to be empty, Mr Hornshottle having set off on foot. "That's a hard skinflint of a callant, it's just to save the expense; but don't tell him, Mac, that I settled for the chairs, or he'll be for nicking his wizzen about losing his hobble hame." "But what will your honour noo be doing to us for our share lift?" asked one of the Celts. "Fall into the procession; M'Millan will pay you the same as the others, and if you meet with a drunk man, put him in, and take him to Mrs Hornshottle's—do you know the house?" "We both do that, and well too." "Then take him there, and tell the servants it's Bob—but he's a little changed with liquor—but that they'll know him when they see him with daylight. Do what I've told you, and I'll give you double fare for your trouble." "Och, we'll do tat, for I'll catch you a' drunk, Pech, in five minute." "I hope," said Logan, as he entered the sedan, "they wont meet with Bob himself; it would be better luck than he deserves." All being ready, the waits struck up, and the procession, lighted by the moon, took its way up the Gallowgate.

* For the sake of some of our readers in the south, it may be necessary to mention that, by the old Scottish Bankrupt Act, the defaulter was compelled to wear what is called "dyvours hose," namely, stockings of different colours—the law, however, was seldom enforced, except when glaring misconduct on the part of the bankrupt was complained of.

TO THE SOUTH WIND.

Balmy breeze from the blossomy south,
Kissing my lips with thy tender mouth,
Touching my forehead with delicate hand,
Lifting my hair up with breath so bland,
And bathing my head with scents of flowers,
Borne from the laps of southern bowers—
Balmy breeze, I behold not thee;
Yet, oh, how beautiful thou must be!

Stay—wilt thou stay, sweet breeze? Ah! now
It hath fled away from my lip and brow;
There, over the plain, its wide robe spreads,
And the gentle flowers are bending their heads:
It hath enter'd the wood—the beautiful breese!
I hear its music among the trees;
And now it is passing over the river—
I know by the water's timid quiver.

Balmy breeze! I behold not thee;
But, oh, how beautiful thou must be!
Come, thou breeze, from the bloomy south,
Kiss my lips with thy tender mouth;
Touch my brow with thy delicate hand,
And take me away to thy southern land;
Then never more, breeze invisible, roam,
But dwell with me in thy spirit's home.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 439. SATURDAY, JUNE 27, 1840. PRICE THREE HALFPENCE.

THE PRISONERS OF MOUNT CAUCASUS.

THE Caucasian mountains have for a long time past been inclosed within the bounds of the Russian empire without being subject to it. Their wild and savage inhabitants, separated by language and conflicting interests, form a number of small tribes, which have very little political intercourse or correspondence with one another, but which are all animated by the same love of independence and of plunder.

One of the most numerous and most formidable of those tribes is that of the Tchetchenges, who inhabit the great and little Kabarda, provinces whose extensive valleys extend almost to the summit of the Caucasus. The men are handsome, brave, and intelligent, but they are determined and cruel robbers, almost in a constant state of warfare with the troops of the line.

It is amidst those dangerous hordes, and in the very centre of that immense chain of mountains, that Russia has established a road of communication with her possessions in Asia. Redoubts or forts, placed at short intervals, defend the way as far as Georgia, but no traveller would ever venture even over that small distance alone. Twice a-week a convoy of infantry with cannon, and a strong party of Cossacks, escort government dispatches and travellers. One of these redoubts has become a village pretty well peopled. From its commanding situation it received the name of Wladi-Caucasus: it is the residence of the officer commanding the troops which perform the hard service we have just now mentioned.

Major Kascambo, of the regiment of Wologda, a man of family in Russia, though of Greek origin, was to take the command of the Fort of Lars in the defiles of the Caucasus. Impatient to reach his post, and brave to rashness, he had the imprudence to undertake that journey with the small escort of fifty Cossacks which he had at his command, and the still greater imprudence to speak of his intention, and to boast of it beforehand.

The Tchetchenges situated near the frontier, who are called Pacific Tchetchenges, are subjects of Russia, and have in consequence a free access to Mosdok, but the greater part of them keep up a correspondence and secret intercourse with the mountaineers, and very often take part in their robberies and share their plunder. The latter, secretly informed of Kascambo's intended journey, and of the very day of his departure, came down in great numbers, and lay in ambuscade on his route. At about twenty versts from Mosdok, on turning a small hillock covered with brushwood, he was attacked by seven hundred horsemen. Retreat was impossible: the Cossacks dismounted and stood the attack with great firmness, hoping to be succoured by the troops of a redoubt which was not very far off.

The inhabitants of the Caucasus, though individually very courageous, are incapable of attacking in a dense body, and are in consequence not very formidable to a steady and well-disciplined body of men; but they have very good arms, and are excellent marksmen. Their great numbers on the present occasion made the conflict too unequal. After keeping up for a considerable time a brisk fire, more than one-half of the Cossacks were killed or disabled; the remainder had formed a circular rampart with the dead horses, behind which they were employing their ammunition to the best effect. The Tchetchenges, who have always among them some Russian deserters, whom they employ as interpreters, made them cry out, "Give up the major, or you shall be killed to the last man!" Kascambo, seeing that the total destruction of his party was inevitable, resolved to surrender, to save the lives of those who still survived. He gave his sword to his Cossacks, and proceeded alone towards the Tchetchenges, who instantly ceased their fire, their sole object being to take him alive, and thereby obtain a ransom. He had scarcely been a moment in the enemy's hands when he perceived in the distance the expected succours approaching. It was, alas! too late—the robbers hurried him off.

His denchick, or soldier-servant, had remained behind with the mule carrying the major's baggage. Concealed in a hollow, he waited the event of the combat. When he was informed by the Cossacks of his master's misfortune, the brave fellow immediately resolved to share his destiny, and, driving his mule before him, followed without loss of time the track of the Tchetchenges. He was beginning to lose sight of the hoof-marks in the darkness, when he fortunately fell in with a straggler, who conducted him to the place of rendezvous.

One may easily conceive what must have been the prisoner's feelings when he saw his denchick come spontaneously to share his miserable fate. The Tchetchenges immediately divided the booty. They left nothing to the major but a guitar, which they restored to him in derision. Ivan* (this was the denchick's name) took possession of it, and although ordered by his master to throw it away, refused to obey him. "Why should we lose courage?" said he; "the God of the Russians is great!†—it is the interest of these dogs to take care of you; they will do you no harm."

After a halt of a few hours, the horde of robbers was in the act of resuming the march, when one of their spies brought information that the Russians were still advancing, and that most likely the troops of the other redoubts would join in the pursuit. A council was held; the object was, not only to keep their prisoner, but so conceal their retreat, and also carry him far from their villages, so as to avoid reprisals. They accordingly dispersed by various roads. Ten men on foot were left in charge of the prisoners, while above a hundred horsemen remained together and proceeded in quite a different direction. They forced the major to take off his boots, whose impressions the enemy might have recognised, and obliged Ivan and him to walk thus barefooted all the first part of the day.

On reaching a torrent, the small party ran back on the grassy banks for about a mile, and then descended at the most precipitous and thorny part of the bank, so as to leave no trace of their passage. The major was so exhausted that they had to support him with belts and ropes to drag him across the water. His feet were all bleeding, and they were forced to give him back his boots to enable him to accomplish the remainder of his journey.

When they arrived at the first village, Kascambo, suffering more from grief than from actual fatigue, appeared to his keepers so wasted and so weak, that they treated him with more humanity than at first. They allowed him some rest and a horse for the journey; but to baffle all the investigations of the Russians, and make it impossible for the prisoner himself to inform his friends of his place of confinement, they carried him from village to village, and from one valley to another, often blindfolded. He thus crossed a large river, which he supposed to be the Sonja. They took great care of him during these expeditions, and allowed him sufficient rest and food. But when once he reached the distant village in which he was finally to be confined, the Tchetchenges suddenly altered their conduct towards him, and inflicted every species of bad treatment on him. They put irons on his hands and on his feet, and a heavy chain about his neck, the end of which was fixed to a large log of oak. The denchick was treated with less rigour. His irons were lighter, which allowed him to perform some services to his master.

In that situation, and at every new vexation he received, a man who spoke Russian came to him and advised him to write to his friends to procure his ransom, which was fixed at ten thousand roubles. It was impossible for the unfortunate prisoner to pay such a large sum, and his only hope was in the efforts of government, as they had formerly released a colonel who had thus fallen into the brigands' hands. The interpreter promised to provide him with paper, and to forward the letter safely; but after obtaining his consent, he was several days without appearing again, and the whole of that time was employed in aggravating the major's hardships and sufferings. They starved him; they took from him the mat on which he lay, and the cushion of a Cossack's saddle which he used as a pillow; and when the ruffian who acted as a mediator reappeared, he informed him, in a confidential manner, that, in case his ransom should be refused, the Tchetchenges were resolved to get rid of him, in order to put an end to the anxieties and expense he caused them. The object of this cruel behaviour was to induce him to write in a more pressing manner. They gave him at last a reed cut in the shape of a pen, and some paper; they took off the irons from his hands and neck, that he might write more at ease; and when the letter was finished, it was translated to the chiefs, who took charge of forwarding it to the Russian lines. From that moment he was treated with less severity, and only loaded with a single chain confining the right hand and right foot.

His jailor was a man about sixty, of a gigantic stature and most ferocious aspect, quite in harmony with his real character and natural dispositions. Two of his sons had been killed in a skirmish with the Russians, on which account he was chosen as the fittest keeper for the prisoner. The family of this man, called Ibrahim, consisted of the widow of one of his sons, about thirty-five years of age, and a young child seven or eight years old, called Mamet, whose mother was at least as wicked, and still more whimsical than the old man. Kascambo suffered much from her; but the caresses and the attentions of young Mamet were to him, in the course of his captivity, a solace and real relief. The poor child formed such an attachment to him, that all the ill humour and bad usage of his grandfather could not prevent him from coming to play with the prisoner on every opportunity. He called him his koniak, which, in the language of the country, means a guest, a friend. He shared secretly with him the fruit he could procure, and, during the long fast the major had to suffer, little Mamet cleverly took advantage of the absence of his parents to bring him bread or potatoes baked under the ashes.

A few months had passed over since the dispatch of the letter, without bringing forth any remarkable event. In that space of time, Ivan had managed to conciliate both the woman and the old man, or rather he had contrived to make himself necessary to them. He possessed to perfection the skill required for a young officer's kitchen. He brewed kislitchi* admirably, and dressed salt cucumbers in a superior manner, and had accustomed his hosts to all the little additions and improvements he introduced in their daily fare.

* His name was Ivan Smirnoff, which might be translated John the Meek, an appellation contrasting singularly with his real character, as will be found hereafter.

† A common saying of the Russian soldier in the time of danger.

* A kind of drink made with fermented bread.

Digitized by Google

To establish himself still farther in their confidence, he also assumed the character of a buffoon, imagining every day some new jest to amuse them. Ibrahim was particularly delighted with his performance of the Cossack-dance. When any of the inhabitants of the village came to visit them, they took off Ivan's irons and bade him dance: he always did it with a good grace, adding every time some new ridiculous gambol. By such means he obtained the liberty of walking through the village, where he was generally followed by a crowd of children attracted by his buffoonery, and as he knew already the Tatare language, he soon learned the language of the country, which is only a dialect of it.

The major himself was often forced to sing Russian songs with his denchick, and to play on the guitar to amuse that wild company. In the beginning they used to take off the irons from his right hand; but the woman having observed that he sometimes did play with the irons on to amuse himself, they never granted that favour again, and the unfortunate musician repented more than once having shown his talent.

To obtain the liberty so ardently wished for, the two prisoners formed many and many a plan, but they were all very difficult to execute. When they had first arrived in the village, the inhabitants used to send every night an additional man to increase the guard. Insensibly this precaution was neglected—the individual very often did not come. The woman and the child slept in an adjoining room, and old Ibrahim remained alone with them; but he used to keep the key of the irons carefully in his pocket, and awoke at the slightest noise. The prisoner was treated every day more severely, and as the answer to his letter did not arrive, the Tchetchenges often used to come to the hut to insult him, and threaten him with the most barbarous treatment. They deprived him almost entirely of food, and he had one day the affliction of seeing poor little Mamet most unmercifully flogged for having brought a few meddlars to him.

A very remarkable circumstance in Kascambo's painful situation, was the respect and confidence which his persecutors could not help feeling for him, and the profound esteem with which he had inspired them. While the barbarians heaped on his head every sort of insult, and every species of oppression, they, notwithstanding, very often consulted him in their private affairs, and made him the judge of their differences. Among other disputes of which he stood umpire, the following deserves to be quoted for its singularity.

One of these ruffians had intrusted a Russian note of five roubles to a comrade who was setting out for a neighbouring valley, charging him to remit it to some one there. The fellow went off accordingly, but lost his horse, which died on the road, and persuaded himself that he had a right to keep the five roubles as an indemnification for the loss he had met with. This mode of reasoning, very worthy of the Caucasians, was by no means to the taste of the proprietor of the cash. At the return of the traveller, there was a great uproar in the village.

These two men had gathered around them their relations and their friends, and the quarrel would have terminated in bloodshed, had not the elders of the tribe, after endeavouring in vain to calm them, advised them to submit the case to the decision of the prisoner. The whole population of the village proceeded tumultuously towards his habitation, that they might sooner learn the issue of this ridiculous case. Kascambo was brought out of prison and seated on the small platform, which served as a roof to the house.

Almost every house in the valleys of Caucasus is partly dug under ground, and is only elevated four feet above the level of the soil; the roof is horizontal, and formed of hard-beaten clay. The inhabitants, the women especially, are in the habit of reposing upon these terraces after sunset, and frequently even spend the whole night there in fine weather.

When Kascambo made his appearance on the roof, a profound silence ensued. It was, no doubt, a wonderful sight to behold before this singular tribunal, infuriated clients armed with pistols and daggers, submitting their cause to a judge loaded with chains, and half dead with hunger and miseries of all sorts, but who judged, nevertheless, without appeal, and whose sentence was always respected and obeyed.

Having lost all hopes of making the defendant understand reason, the major ordered him to approach; and resolved to win the laughers at least over to the side of justice, he put to him the following question:—"If, instead of giving you the five roubles, your comrade had merely charged you with his compliments, would your horse not have died all the same?"

"Perhaps," answered he.

"Well, then," added the judge, "what would you have done with the compliments? Would you not have been obliged to keep them as a payment, and be content? I order, in consequence, that you shall give back the note, and your comrade shall give you his compliments."

As soon as this sentence was translated to the spectators, a universal roar of laughter proclaimed afar the wisdom of the new Solomon. The defeated man himself, after some farther discussion, was forced to yield, and said, giving up the money, "I knew beforehand that I should lose, if that dog of a Christian had any thing to do with it." That extraordinary confidence shows what an idea these people must entertain of European superiority, and it is also a proof of the innate sentiment of justice which exists even among the most ferocious and most savage of men.

Kascambo had written three letters since his detention without receiving any answer: a year had passed over. The unfortunate prisoner, deprived of linen, and in utter want of every comfort of life, found his health fail rapidly, and was giving way to despair. Ivan himself had been ill for some time. The stern and severe Ibrahim, however, to the great surprise of the major, had taken off the young man's irons while his indisposition lasted, and left him still at liberty. The major interrogating him one day on that subject, "Master," said Ivan, "I have wished for a long time to consult you upon an idea that has come into my head. It strikes me it would be wise in me to become a Mahometan."

"You are become mad, I suppose."

"No; it is the only way in which I can be useful to you, and at least procure you some good food and some linen—in short, who knows?—when I am free. The God of the Russians is great!—we shall see."

"But God himself will forsake you, wretch that you are, if you betray him."

Kascambo, whilst he was lecturing his servant, could scarcely refrain from laughing at his absurd plan; but when he proceeded to forbid him peremptorily to go on with it, "Master," replied Ivan, "it is out of my power to obey you, and it would be useless to conceal it any longer: the thing is done; I have been a Mahometan since the very day you thought me ill, and my irons were taken off. I am called Houssein now. Where is the harm? I shall become a Christian again whenever I like, and as soon as I am free. See, I have already no more irons on, and I can break off yours at the first favourable opportunity, which I hope will soon present itself."

According to the promise made, he was no longer chained, and enjoyed from that moment a greater liberty; but that very liberty had nearly proved fatal to him. The principal leaders of the expedition against Kascambo soon began to fear lest the new Mussulman should desert. The long stay he had made among them, and the knowledge he had acquired of their language, enabled him to know them all by their names, and to give their description at the Russian lines, supposing he should reach them, which would expose them individually to the vengeance of the Russians: and they in consequence highly disapproved of the ill-judged zeal of their priest. On the other hand, the strict Mussulmans who had favoured him at the moment of his conversion, soon observed that when he said his prayers on the roof of the house, as is the custom, and as the Mollah had particularly recommended him to do, by way of conciliating the public good-will, he often happened by mistake to intermix some signs of the Cross among his prostrations towards Mecca, to which place, by another still more unfortunate blunder, he at times turned his back—a series of accidents, which made them rather suspicious as to the sincerity of his conversion.

A few months after his feint apostacy, he perceived a great change in the manners of the inhabitants towards him, and could not mistake the manifest signs of their ill will. He was seeking in vain the cause of that alteration, when some young men, with whom he was particularly intimate, came and proposed to him to accompany them in an expedition they were about to undertake. Their plan was to pass the Tereek, to plunder some merchants who were going to Mosdok. Ivan accepted without hesitation. For a long time he had wished to procure himself some arms; and they promised him, besides, a share of the spoils. He thought, also, that on seeing him return to his master, those who suspected him of wishing to desert, would no longer have any grounds to justify their suspicions. However, the major having strongly opposed his joining the party, he pretended to have given up the thoughts of it, when, one morning, Kascambo awaking, saw the mat upon which Ivan used to sleep carefully rolled up against the wall; he had gone off during the night. His companions were to pass the Tereek the following night, and attack the merchants, whose march was known and followed by their scouts.

The confidence of the Tchetchenges ought to have created suspicions in Ivan's mind. It was not natural in men, so cautious and so cunning, to admit so freely a Russian, their prisoner, in an expedition directed against his own country people. It was, indeed, found out some time afterwards, that they had invited him to accompany them with the sole intention of murdering him. As his quality of a convert obliged them to some sort of regard, they had proposed to keep a close look-out upon him on the road, and to make away with him at the moment of the attack, leaving it to be supposed that he had perished in the fight. Only a few members of the party were in the secret; but the event baffled all their sanguinary designs. Their troop was hardly placed in ambush, to attack the merchants, when it was itself surprised by a regiment of Cossacks, and so vigorously charged, that they had infinite trouble in passing the river again. The intensity of the danger made them forget their plot against Ivan, who followed them in their retreat.

While the panic-struck band was crossing the Tereek in complete disorder, the horse of a young Tchetchenge stumbled in the middle of the river, and was immediately carried off by the rapid stream. Ivan, who was behind him, pushed his horse forward, at the risk of being drowned himself, and, taking a firm hold of the youth, at the moment he was disappearing under the foaming waters, succeeded in carrying him safely to the opposite shore. The day was then beginning to dawn, and the Cossacks, recognising his uniform, immediately marked him out, and shouted, "A deserter! Kill the deserter!" His clothes were completely riddled with balls. At last, after having fought with the courage of despair, and burnt all his cartridges, he returned to the village with the glory of having saved the life of one of his companions, and of having made himself useful to the whole troop.

If his conduct on this occasion did not gain over all the party to him, it won him at least a friend; the young man he had saved adopted him for his konisk (a relation held sacred by the mountaineers of the Caucasus), and swore to defend and protect him against each and every one. But this union and friendship were not sufficient to protect him against the hatred of the principal inhabitants. The courage he had displayed, his attachment to his master, increased to a great degree the fears with which he had inspired them. They could no longer look upon him as a buffoon, incapable of any design or enterprise, such as they had supposed him to be till then; and when they reflected on the failure of the expedition, to which he had been admitted, they began to wonder how the Russian troops had come upon them so completely in the opportunity of time, in a place so distant from their ordinary residence, and they suspected him of having secretly communicated with them. Although their conjecture was completely without foundation, they watched him more closely. Old Ibrahim himself, fearing some plot for the prisoner's escape, prevented all conversation between them; and the brave denchiak was menaced, and even sometimes beaten, when he wished to converse with his master.

In this miserable and distressing situation, the two prisoners contrived new means of conversing, without raising the suspicions of their keeper. As they were in the habit of singing Russian songs together, the major took his guitar, when he had any thing important to communicate to Ivan in the presence of Ibrahim, and sang out his questions. Ivan answered to the same tune, and his master accompanied him with the instrument; this arrangement presenting nothing new, their enemies never found out the stratagem, to which, besides, they resorted but very seldom.

More than three months had elapsed since the unfortunate expedition we have mentioned, when Ivan thought he perceived some extraordinary stir and agitation in the village. Some mules, laden with powder, had arrived from the plain. The men were busily engaged cleaning their arms, and making cartridges; he soon learned that a grand expedition was in preparation. The whole nation was to unite in attacking a neighbouring tribe, which had placed itself under the protection of the Russians, and allowed them to construct a redoubt on their territory. The object of this campaign was no less than to exterminate the whole population, along with the Russian battalions who protected the construction of the fort.

A few days after, Ivan, on leaving the hut in the morning, found the village completely deserted. Every man capable of carrying arms had gone off during the night. In the short turn he took through the village to gather information, he obtained new proofs of the bad intentions entertained towards him. The old men evidently shunned him. A little boy plainly told him that his father was resolved to kill him; and as he was returning, absorbed in mournful thoughts, he saw on the roof of a house a young woman, who raised her veil, and, with signs of the greatest alarm, motioned him with her hand to be off, pointing towards Russia. She was the sister of the young Tchetchenge he had saved at the passage of the Tereek.

When he entered the house, he found the old man busy examining Kascambo's irons. A new comer was seated in the room; it was a man whom a slow fever had prevented from accompanying his comrades, and who had been sent to Ibrahim as an additional guard over the prisoners, till the return of the inhabitants. Ivan marked that precaution, but without showing the slightest surprise. The absence of all the men from the village presented an admirable opportunity for the execution of his designs; but the increased vigilance of their jailor, and the presence of the invalid, rendered their success very uncertain. However, his death was inevitable if he waited the return of the warriors: he foresaw that their expedition would be unsuccessful, and that, in the fury of disappointment, they would not spare him. He had no other alternative than to abandon his master or deliver him forthwith. He would have rather suffered a thousand deaths than adopt the first resolution.

Kascambo, who was beginning to lose every sort of hope, had fallen into a kind of stupor, and preserved a profound silence. Ivan, on the contrary, was more calm and more gay than usual; he fairly surpassed himself in preparing the dinner, and kept singing the whole time Russian songs, in which he introduced some words of encouragement for his master. "The time has come," said he, adding at every phrase the insignificant chorus of some Russian popular song, "*Hai luli, hai luli*—the time has come to put an end to our misery or to die. To-morrow, *hai luli*, we shall be on the road to a town, a pretty town, *hai luli*, which I shall not name. Courage, dear master! the God of the Russians is great!"

Kascambo, completely indifferent to life or death, and ignorant of his denchick's plans, merely answered, "Do as you please, and hold your tongue." Towards

the evening, the sick man, whom they had treated generously to make him stay, and who, besides a very copious meal, had amused himself the whole day eating chislik,* was seized with such a violent access of fever, that he had to give up, and retired to his own house. He was allowed to depart without great difficulty; Ivan having completely removed every fear of the old man by his extraordinary gaiety. To remove more entirely every cause of suspicion, he withdrew very early to the end of the room, and laid himself down on a bench against the wall, waiting till Ibrahim should fall asleep; but the latter had resolved to watch all night. Instead of spreading himself on a mat near the fire, as usual, he sat himself down on a large log of wood, opposite to his prisoner, and sent away his daughter-in-law, who retired to the next room where her child was, and shut the door.

From the dark corner in which he was placed, Ivan observed attentively the scene before him. By the glimmering light of the fire, which flashed at times a transient blaze, an axe glittered in a recess of the wall. The old man, overcome with sleep, would at times let his head fall heavily on his chest. Ivan saw it was time, and rose to his feet. The suspicious jailor immediately noticed it. "What are you doing there, you dog!" cried he, harshly. Ivan, instead of answering, proceeded towards the fire, yawning and stretching himself, like a man coming out of a deep sleep. Ibrahim, who felt overcome with sleep, ordered Kascambo to play the guitar to keep him awake. The major was about to refuse, but Ivan brought the instrument to him, making the usual sign; "Play, master," said he; "I want to speak to you." Kascambo tuned the guitar, and beginning immediately, they sang together the terrible duet which follows:—

Kascambo.—*Hai luli, hai luli*, what have you got to say! be cautious!" (At every question and every answer they sang a verse of a Russian song.)

Ivan.—"See that axe, but do not look at it. *Hai luli!* It shall dash out that villain's brains. *Hai luli! hai luli!*"

Kascambo.—"Useless murder! *Hai luli!* How could I escape with my irons?"

Ivan.—"The key will be found in the rascal's pocket. *Hai luli!*"

Kascambo.—"The woman will give the alarm. *Hai luli! hai luli!*"

Ivan.—"Never mind, happen what may, will you not perish all the same—*hai luli!*—of hunger and of misery?"

The old man becoming attentive, they repeated a double allowance of hai lulis, accompanied by a loud arpeggio. "Play, master," added the denchick, "play the Cossack; I shall dance round the room to get near the axe; play boldly!"

Kascambo.—"Well, let it be so, this hell will be over." He turned aside his head, and began to play the dance with all his might.

Ivan began the steps and grotesque attitudes of the Cossack, which pleased the old man most particularly, making ridiculous leaps and gambols, and uttering loud shrill cries, to distract his attention. When Kascambo saw that the dancer was near the axe, his heart beat violently in his chest, and he panted with anxiety; that instrument of their deliverance was in a little press without a door, cut in the wall, but at an elevation which Ivan could not very easily attain. To bring it within his reach, he seized a favourable instant, caught it rapidly, and put it on the ground, in the very shade formed by Ibrahim's own body. When the latter looked round at him, he was already far from the spot, and continued the dance. This dangerous scene had lasted for some time, and Kascambo, tired with playing, began to think that his denchick's courage was failing, or that he did not judge the opportunity favourable. He raised his eyes towards him at the moment when the intrepid dancer, with the uplifted axe, was advancing in steady strides to strike the old brigand. The emotion the major felt at this sight was such, that he ceased playing, and dropped the guitar upon his knees. At the same moment, the old man had stooped, and made a step forward to push some brambles into the fire: the dry leaves blazed up immediately, and threw a great light into the room: Ibrahim turned round to sit himself down.

If at that moment Ivan had persevered in his enterprise, a struggle man to man became inevitable, and the alarm would have been given, which was to be avoided above all things; but his presence of mind saved him. He no sooner perceived the major's agitation, and saw Ibrahim get up, than he put down the axe immediately behind the log he used as a seat, and resumed the dance. "Play, play!" said he to his master; "what are you thinking of?" The major, seeing the imprudence he had committed, quietly recommenced playing. The old jailor had not a suspicion, and sat down again; but he ordered them to stop the music and go to rest. Ivan brought calmly the guitar-case, which he placed on the stove; but, instead of receiving the instrument from his master's hand, as quick as lightning he seized the axe behind Ibrahim, and struck him such a terrible blow on the head, that the unfortunate wretch did not even give a sigh, but fell dead with his face in the fire: his long grey beard was instantly in flames; Ivan pulled him aside by the feet, and covered him over with a mat.

They were listening to know if the woman had been awake, when—astonished, no doubt, at the profound silence which had succeeded to such a noise—she opened the door of her room. "What are you about here?" said she, advancing towards the prisoners; "what means that smell of burnt hair?" The fire, which had been scattered about, produced almost no light. Ivan lifted the axe to strike her—she saw it in time to throw aside her head, and received the blow in the chest—she fell with a groan: a second blow, as rapid as a thunderbolt, caught her in her fall, and laid her dead at Kascambo's feet. Frightened and horror-struck at this second murder, which he did not expect, the major, seeing Ivan proceed to the child's room, rushed forward to stop him. "Where are you going, wretch?" said he; "would you have the ferocity to sacrifice also that poor child who has shown me so much affection? If you were to deliver me at such a price, neither your attachment nor your services could save you whenever we reach the line."

"At the line," said Ivan, "you will do as you please, but here we must put an end to all this."

Kascambo, gathering his whole strength, caught him by the collar, as he was forcing his way. "Villain!" cried he, "if you dare to attempt his life, if you touch one hair of his head, I swear here before God that I shall give myself up to the Tchetchenges, and your cruelty will be fruitless."

"To the Tchetchenges!" repeated the excited denchick, raising the axe over his master's head; "they shall never take you alive again: I shall murder them, you, and myself, before that shall happen. That child can ruin us by giving the alarm, and, in your present condition, a woman might drag you back to prison."

"Stop, stop!" cried Kascambo, out of whose hands Ivan was trying to escape; "stop, monster; you shall kill me before you commit this crime!" But alas! weak as he was, and embarrassed with his irons, he could not hold the excited young man, who pushed him violently aside, and he fell heavily to the ground, half dead with surprise and horror. Whilst, all covered with the blood of the first victims, he was struggling to get upon his feet, he cried out incessantly, "Ivan, I entreat you, do not kill him; in the holy name of God, spill not the blood of that poor innocent creature!"

As soon as he could, he ran to his assistance; but on reaching the door of the room, he knocked himself in the dark against Ivan, who was returning. "Master, all is over; let us lose no time, and make no noise. Don't make any noise," answered he to the bitter and desperate reproaches which his exasperated master addressed to him. "What is done, is done; now there is no drawing back. Till we are free, every man I meet is dead, or he shall kill me; and if any one enter this door before our departure, I consider not whether it be man, woman, or child—I shall stretch them there with the others."

He lighted a splinter of larch-wood, and began to search the pouch and the pockets of the dead brigand. The key of the irons was not there. He sought it also in vain in the woman's clothes, in a trunk, and every where he imagined it might be concealed. Whilst he was engaged in this pursuit, the major was giving way, without any prudence or control, to the bitterness of his grief; Ivan consoled him after his own manner. "You ought rather," said he, "to mourn the loss of the key of your irons, which can't be found; what can tempt you to regret these wretches, who have tormented you more than fifteen months? They wanted to make away with us. Well, their turn has come before ours. Is it my fault?"

[Here must in the mean time be concluded this singular, but true narrative: it will be resumed and brought to a close in the ensuing number.]

* Mutton roasted in small bits at the end of a sharp stick.

POPULAR INFORMATION ON POLITICAL ECONOMY.

FOURTH ARTICLE.—LABOUR.

Labour is a word which political economists have used in two different senses. In its more accurate application, it refers to the means adopted for obtaining certain ends; but it has likewise been adopted to designate those ends themselves, or the *results* of labour in its more correct designation. Thus, in a former chapter, capital was spoken of as accumulated labour. It is in the former sense alone that we have here to discuss the subject.

Labour may be defined as the exertion, bodily or mental, expended for the accomplishment of a certain end. In the common use of the word, the result aimed at is not so much kept in view as the extent of the exertion expended in accomplishing it. When a man continuously exerts his sinews, he is said to labour; and if he do so to the production of some end neither useful to himself nor to others, his labour is said to be unprofitable. In considering the nature of labour, however, in connexion with political economy, that kind only can be taken into consideration which is profitable in some form or other; in other words, that which results in some service being done to the community. Whatever a man does for the purpose of procuring food and clothing for himself, is labour. But however energetically a man should gratuitously exert himself in wrestling or gymnastics, he would not be considered as labouring, unless, indeed, it might be said that he was thus laying in a stock of strength to fit him for some useful industry; in this case, to the extent to which he lays in strength to render that industry more productive, he may be said to labour. Suppose, however, that the individual is paid for exerting himself in wrestling or gymnastics. Here the occupation entirely changes its nature, and becomes to its full extent labour. It may not, to be sure, be of much ultimate service to mankind; but fashion, caprice, or whatever else may have instigated the desire for it, is to be supposed in such an event to have made it one of the wants of society; the community are ready to give value for it, and the operation through which the demand is supplied is labour.

The demands of society are thus the only criterion to distinguish what is labour in this sense, and what is not. It is impossible to establish any other criterion of utility. A man may be convinced that a certain occupation in which he is engaged will be productive of the greatest benefit to mankind; but if men will not take him at his word, and pay him for his exertions, these exertions are not labour in the sense in which it is necessary here to view it—as an article in the market. On the other hand, the quack, whose pills cut off his fellow-beings by thousands, is, in virtue of the credulity to which he ministers, a labourer in the strictest sense of the term. It follows, that certain exertions will be partly labour, partly not: namely, labour, in so far as they are spent on something which is wanted—mere useless tension of mind or muscle, in so far as they are applied to what is not wanted. Thus, the exertion of making tiles for covering houses will be strictly labour; but if the tile-maker should volunteer to spend his time in putting certain ornaments on the interior of the tiles, where they will not be seen, and where consequently they will have no such value in the eyes of the purchaser as will prompt him to make an allowance for them, here is a mere fantastic outlay of time and exertion. Lost labour it would be called; and in the sense in which labour is viewed in political economy, it would be no labour at all.

But let us bring this doctrine to bear more clearly on practice. The loss of labour, in the manner just illustrated, is but casually and rarely exhibited; but there is another form in which it is too common, namely, that where exertion is used in producing something which is in demand, but a greater quantity is produced than what is demanded. Thus, if ten men be sufficient to produce the quantity of shoes requisite for the consumption of a village, while there are in reality twelve shoemakers at work in it, one-sixth part of their exertions is lost. To estimate, however, the number which is required for the wants of a community, there are various circumstances to be taken into consideration. The proportion which any class of labourers ought to bear to the other members of the community, cannot be absolutely fixed; it must bear relation to circumstances. Thus, in a country where there is much capital, and a comparatively small population, the value of every kind of labour will be greater than where the population is large and the wealth small. Let us take two communities, then, in one of which the demand for every kind of labour is double what it is in the other, while the number of labourers is the same in both. If there be ten shoemakers in each, though those in the former make double by their work what those in the latter do, yet there is none of the labour of the latter thrown away, because the quantity produced is proportioned to that of other productions of labour. If, however, the shoemakers of the latter could easily remove to the former, and did not do so, they would be throwing away their labour.

There is still, however, another matter to be taken into consideration, before we can estimate whether any particular portion of the labour-market is overstocked, namely, the relative amount of labour necessary for the different trades or professions which are open to a man's choice. In the same town you will find two sets of workmen, the one of which receives a shilling a-day, while the other receives five shillings; and yet each of these methods of occupation shall have just the proper quantity of labour devoted to it, so that none is thrown away. The difference is owing to the intensity of the labour bestowed in the one, in comparison with that bestowed in the other; or, in other words, to the comparative rarity or abundance of the qualifications required for the two pursuits. The superiority may be in muscular strength, in neat handedness, or any other description of skill, or in education; the result simply is, that the labour in the one case is more valuable than in the other, and for the purposes of comparison it may be talked of as more intense. Here, as in other cases, it is impossible to draw absolute distinctions; they must be left to be arranged by circumstances as they occur. If we suppose the labourer who gets five shillings a-day to be a watchmaker, and he who gets one shilling to be a pavier, then the labour of watchmaking is in that community five times as valuable as the labour of paving, and for the purposes of political economy it is so much the more intense. In other places there may be adventitious circumstances; such as a peculiar abundance of persons possessing the qualities necessary for being

Digitized by Google

watchmakers, which may make the difference in value less. These circumstances will be more minutely considered when we come to treat of wages.

We are now, perhaps, placed in a position to take a more minute view of the circumstances in which labour may be thrown away or lost through the miscalculation of the labourer. Suppose there are two trades, the qualifications for the performance of which are exactly of the same standard; if there be a greater proportional number of persons employed in the one than in the other, then the former is glutted, as it is termed, and there is so much labour thrown away. Suppose that the trade of shoemaking and that of saddlery require exactly the same qualifications; in other words, that of a certain number of men able to do both, each is able to do either the one or the other. Let us suppose that the quantity of saddlery labour required is just half that of shoemaking labour which is required. Suppose that the number of men capable of performing both is thirty; to make their labour bear to the community its exact value, there ought to be twenty shoemakers and ten saddlers. If, instead of this, there are twenty-five shoemakers and five saddlers, here are five men throwing away their labour, or, a fifth part of the labour of twenty-five men is lost.

If this were merely a theoretic distinction, which did not affect practice, we should not have enlarged upon it. Unfortunately, it is too amply illustrated in daily life. District or family prejudices, and the natural indolence of the human mind, prompt men to follow professions which are much overdone. Apart from greater exertion, mere change of pursuit and habit would often materially increase a man's income; yet the change will not be made. It is thus that generation after generation will follow a trade, for the produce of which the demand once existing has ceased, and they will call it a "poor trade," and consider themselves oppressed by the rest of mankind, forgetting that their hardships are the result of no other combination of circumstances beyond their own foolish choice. The mistake is exhibited, perhaps, most glaringly in the adherence of individuals to localities where their labour is not profitable. Thousands of individuals, who could incalculably benefit their condition by removing to spots where there is a demand for labour, do not dream of adopting the means of benefiting themselves and society, but dose away life in their self-elected poverty, ruminating on a vague conviction that Providence has not destined them for good fortune. In the two subjects of wages and machinery, a little more practical light will be endeavoured to be thrown on this subject. Meanwhile, it is our design, by the above remarks, to bring to the conviction of our readers the circumstance, that the man who follows an unprofitable, instead of a profitable occupation, not only injures himself but society at large. He is like one who should join a multitude of others, to divert their labour from the channel of utility, and employ it in something useless. The supernumerary workman, on the principles above pointed out, is as ill employed as if he were assisting to build a new pyramid in Egypt. Those who take their labour to a wrong market, are thus not merely themselves the sufferers—they occasion a loss to the community. On those who are blind to the dictates of self-interest, this consideration will probably not have much effect; but it is fit that it should be kept in view by those more stirring spirits, whose exertions not only benefit themselves, but are frequently the means of rousing the dormant energies of their neighbours. The indolent and injudicious will be carried forward by the power of public opinion, when nothing else will move them; and it is difficult to form an idea of the amount of good that might be done by the propagation of sentiments tending to counteract the barbarous prejudices which tie people to employments which have ceased to be profitable.

In a commercial and thickly peopled country, the greater part of the labour of the inhabitants will be for sale, and not for home consumption. The expertness acquired by the person who devotes his labour to one object, aided by the facilities which the application of capital gives to the employment of labour in the form in which it is most profitable, tend to place the community in such a position that each man finds he will possess the greatest quantity of the comforts of life, not by making them for himself, but by employing his labour in some one article used by others, by selling which he is enabled to choose from the general market articles produced by others under equally advantageous circumstances. In this country, indeed, the division of labour is carried so far, that we but seldom meet with an article in ordinary use the whole of which is fabricated by one individual. The labourer who thus throws the produce of his exertions into the general market, has thus a perpetual measure of the value of his industry, which he who devotes his time to the production of articles consumed by himself cannot so easily achieve. There are many circumstances in which the produce of labour may be profitably consumed by the labourer. For instance, it would in general be a clear loss were the baker to buy the bread he uses at home, or the shoemaker the shoes he wears. If the former, however, instead of selling his bread and buying shoes, were to make them for himself, bestowing on the work the time he might give to his own trade, he would in almost every case be a loser. There are, at the same time, many descriptions of labour which constitute separate professions, and which, at the same time, in certain circumstances, it may be more advantageous for a man to do himself than to get done by others. Thus, the farmer bakes his own bread, while the merchant and manufacturer purchase theirs. When we find, however, that even those who sell their labour frequently go to the wrong market, it is still more likely that those who have not the criterion of a price before them should mistake the value of their exertions. Hence, there is much domestic labour wasted. Variety of occupation is sometimes sought as a recreation, and the exertion which may be thus applied is not to be looked on as wasted labour. There is, however, a fallacy in favour of home production, which makes many a man launch into expense under the guise of economy. There is a lurking feeling that the payment of money only is extravagance, and when that unpleasant process can be avoided, the receipts that are sacrificed are overlooked. Many a man who, if he turned his attention to one object, might make a comfortable livelihood, fritters away his time and abilities in multitudinous ingenious pieces of labour, by which he avoids sundry trifling disbursements at the sacrifice of the substantial means of living.

In labour—useful labour, as we have above explained it—we find the great standard by which the value of every commodity is measured. How much of the produce of labour will be given in exchange for it? is the simple question by which the value of any thing is ascertained. There are, indeed, just two elements of value—labour and monopoly. That a thing should bear value in the general market of the world, it is necessary that labour should have been expended on it, or that it should be something of which the supply is limited, and for which a certain portion of the proceeds of labour will be given. Of the former, gold itself, as the reader may recollect was shown in the first chapter, is an instance. Of the second, land is the most extensive example in existence. As will be more minutely explained under the subject of rent, the only means of ascertaining the amount of value that is in a monopolised commodity is by measuring it with labour; there is nothing in its intrinsic nature that can indicate the extent. Of three fields, perfectly on a par in their capabilities and proceeds, one in the vicinity of Manchester or Glasgow will bring £12 an acre; a second, in the more remote parts of Perthshire, will bring £2; and a third, in Hungary, may not be worth 5s. Here we have an illustration of another truth, to be afterwards more fully explained, that it is only through means of labour that even the monopolised article is made valuable. This latter is, after all, but an instrument in the hands of industry, worthless of itself, but capable of being increased in value to an incalculable extent, when made the subject of man's industrial exertions.

Before leaving this subject, it may be as well to notice a distinction, adopted by Adam Smith and others, between productive and unproductive labourers. "There is one sort of labour," says Smith, "which adds to the value of the subject upon which it is bestowed; there is another which has no such effect." As of the former kind, he classes the labour of the manufacturer; while he says, "The sovereign, for example, with all the officers both of justice and war who serve under him, the whole army and navy, are unproductive labourers." That such a distinction as that between productive and unproductive labour does exist, may be admitted; but a little consideration will show that it is impossible to draw the line. As has been already observed, there are very few articles in common use which are the production of any one man; the greater part are the result of an organised division of labour. If we admit, then, that the man who hammers out a knife blade, that he who grinds it, that he who whets it, and that he who fixes it to its handle, are each one a productive labourer, shall we deny the same character to the overseer, without whose organisation the labour could not have been thus productively divided, or to the book-keeper, whose daily attention to his duties are necessary to keep the establishment from ruin? If we admit these, shall we then exclude the policeman and the magistrate, whose labour is bestowed in preserving that social order, without which all the manufactories of the district would cease to exist, or the physician, who assists in preserving the health of the workmen? Let us take the distinction in another view. Is a maker of children's toys a productive labourer? This, by the way, is an occupation involving more capital and industry than many would readily anticipate. An instance has been known of a glass manufacturer receiving an order for £500 worth of glass eyes. If it be decided that the toymaker is unproductive, what shall we say to the maker of the ornaments which gratify the adult; the painter, the statuary, nay, the builder and the clothier, in as far as their exertions are bestowed on the production of mere ornament? On the other hand, if the maker of toys is a productive labourer, shall we exclude the actor or the rope-dancer, whose exertions are directed to the same end—that of producing amusement? If we take the extremes of the scale, however, the distinction appears very forcible. The baker or the cotton-spinner may be deriving small incomes when compared with that of the rope-dancer; yet there is no comparison as to the respective productiveness of the two, or as to the extent to which their distinct efforts tend to increase the wealth or useful commodities of the community. The rope-dancer, indeed, however large his income, is rather a vehicle through which the productions of others are dispersed, than himself a producer. He is a means by which the money of his neighbours is spent, neither increasing nor decreasing its amount by his own efforts. He gives amusement, however. The manufacturer loses part of his inducement to exert himself if he have not some means of relaxation; and thus even the rope-dancer is to a certain extent indirectly productive.

SKIMMINGS FROM AN OLD RECEIPT-BOOK.

THROUGH the kindness of a friend, we have obtained a sight of a manuscript receipt-book, written early in the last century, and which latterly seems to have belonged to the Honourable Margaret Murray, a sister of the first Earl of Mansfield. Such books were to be found in every house of any consequence, before printed manuals of cookery had become common. They were generally compiled from one another, with such additions as each lady housekeeper could give from her own skill and experience, or as could be obtained from the skill and experience of her nearest friends and neighbours. Accordingly, many of the receipts were of indefinite antiquity, while others might be considered as nearly contemporary with the date of the particular manuscript in which they appeared. The book before us contains many curious matters, illustrative of the habits of thought and the habits of common life which prevailed rather more than a hundred years ago.

The receipts in this book are not, it must be observed, cookery receipts. They refer to the more refined parts of housekeeping, as the preserving of fruits, the compounding of sweet cakes, and the making of cordials and medicinal preparations. Common cookery would, we presume, be left to servants, who would conduct it according to traditionary rules which no one ever thought of improving; while the ladies themselves would deem it a fair part of duty, to study the mysteries of pastry, preserving, and the concoction of specifics. Not even the highest rank seems to have been exempted from such labours, for, amongst these nostrums, is one entitled "The *Countess of Ruthland's* Receipt for making the rare Bamburry Cakes qich was so much prais'd att her doughter's wadding." If we might judge from the volume in our possession, we would say that much more attention must have been bestowed by the ladies of those days upon confectionery than upon learning, for the spelling is generally of a very original kind, and the handwriting in many parts by no means distinguished for elegance.

It does not seem necessary to bestow any particular notice on the great mass of the receipts in our volume, these referring only to ordinary objects, as "To make marmollate of oranges," "To make a goosberry Full," "To make Cherrie Water," "To make Gilly Flowr water," "To make Steill Carvie," "To clarifie Sween's Saime," "To make goosberry Wine," "To make Curran Wine," &c. Here the titles, we presume, are enough. Our attention, however, is irresistibly arrested when we come to such a characteristic and peculiar receipt as "To make Oyll of Swallows," which proceeds thus:—"Take swallows as many as you can get, ten or twelve at the least, *and put them quick into a mortar*; and put to them lavender cottone, speke, cammomyle, knot grass, ribwort, balm, valerian, rosemary tops, woodbine tops, strings of vines, French mallows, the tops of ale hoof [and other ten or twelve like things], of each of thes ane handfull; *beat all thes together*, and put thereto a qart of neats feet oyll, or May butter; *stamp them all together*, and beat them with ane or twe ounces of cloves, and put them all together into ane earthen pot; stop it verie clos with a piece dough round about, so clos that no air can come out; set them nine days in a cellar, and then take them out and boyle them six or eight hours on the fire, or else in a pan of water; but first open your pat and put in half a pound of vax whit or yellow, and a pint of sellat oyle, and strain them through a canvass cloth." For what purpose on earth could our ladies have designed this unhallowed mixture!

"King Edward's Perfume" is highly characteristic of the age when floors were strewed with rushes, and only cleaned once in a few weeks. "Take twelve spoonfulls of right red rose water, the weight of sixpence in fine powder of sugar, and boyll it on hot embers softly, and the house will smell *as though it were full of roses*; but you must burn the sweet cypress wood befor, *to take away the gross air*." "A Cordiall Water of Sr Wallter Rouligh's" is also worth giving. "Take a galloun of strawberries, and put them into a pint of aquavitæ: let them stand four or five days. *Strain them genteely out*, and sweeten the water as you pleas, with fine sugar or with perfume."

Here, however, is a much greater marvel than any of the above, namely, "A Soveraigne Water of Doctor Stephen's, which he a long time used; wherewith he did many cures; he keept it secrett till a little befor his death, and then gave it to the bishope of Canterbury in a writing, which is—Take a gallone of good Gascon wine, and take vinegar, gallingall, cinnamun, nutmegs, cloves, grains, annisseeds, fennell seeds, of every of them a dram; then take carroway seeds of red, mintes, rose, tyme, pelletory of the wall, rosemary and wild tyme, camomyle, the leaves if you cannot get the flowrs of small lavender, of each a handfull; then bray the spiret small, and bray the herbs, and put all into the wine, and let it stand twelve hours, stirring it divers times, then still it in a lembik, and kep the first

Digitized by Google

water, for it is best; then put the second water by itself, for it is good, but not of such virtues." Hear, reader, the virtues of this water: "It comforts the vital spirits, and helps all inward diseases, that come of cold. It is good against the shaking of the palsie. It cures the contraction of the sinews. It kills the worms in the belly and stamach; it cures the dropsie; whosever useth this water morning and evening and not too often, it *preserveth him in good liking*, and will *make him seem young verie long*, and comforteth nature marvellously. With this water did Master Stephen preserve his life till extream age wold not let him goe nor stand, and he continued fyve years when all the physicians juged he [wold] not live a year longer, nor did he use any other medicine but this!"

It will be observed that Dr Stephen's sovereign water includes an ingredient which has generally been allowed to have a direct effect in "comforting the vital spirits." The same principle is found in all the other cordials described in our receipt-book. We have "The Lord Spencer's Cherrie Water," the basis of which is "ane pottle of new sack," and which is "good for faintings and soondings;" likewise "The Lady Spotswood's Stamach Water," the basis of which is "white wine ane pottle;" and "Doctor Butler's Cordial Water against melancholy, most approved," which seems at first to be a mere decoction of a great list of gay spring flowers, until, on looking a little closer, we discern that it, too, has a substantial foundation, in "a qart of Canary wine," so that even we moderns may well believe the concluding passage—"take of this water at one tyme three spoonfulls thrice a weick, or when you are il; it *cureth all malancholy fusies*." So also "A Cordial Water called Sanatifera" rests upon "a Chopine of Brandie," which is only, as it were, by the bye, ordered to be poured upon "the ingredients;" not to speak of the concluding direction to "take a spoonful or two *amongst a litle warme ale*."

There is "A Receipt of Water much magnified by the Hylanders and Italeans, for thikening the hair wher it is, and making it grow wher it is not;" but the ingredients are not to be enumerated before polite society. At the bottom of "a Receipt against Melancholy and Madness," we are informed that "the eating of a roasted magpie is very good against Madnesses, *tho occasioned by witchcraft*; but if it makes the patient wors, vomiting well will make it good." As further illustrations of the habits of ladies of high rank in those days, we have "To make chees, Lady William Hay's way," "How to make Cherrie Brandie, the Countess of Linlithgow's way," a "Receipt to make Gillie of Hartshorn, my Lady Hyndford's way," a "Receipt for Goosberry Venegar, my Lady Ormiston's way," and a rival receipt to the last by "Colonel Keith's Lady." Lady Balcanquhal, Lady Woodhall, and Mrs Isobel Stirling, also appear as authorities on these grave matters. Nor was the sterner sex above lending their aid. The Lord Spencer's Cherrie Water has already been alluded to. We have also "The Lord Barron Halmon's True Receipt of the Queen of Hungarie's Water," and "Lord Neill Campbell's Receipt for a Squinancy, which he bought for 3 guinies from a mason who lived by it when he could not work." This Lord Neill was a younger son of the famous Marquis of Argyll, beheaded at the Restoration. That men of such rank should have put faith in obscure nostrums practised by the humblest and most ignorant of the community, shows in a striking light the imperfect wisdom of those times.

OCCASIONAL NOTES.

PROCRASTINATION.

We are told by an old proverb "never to leave things till to-morrow that can be done to-day," and many examples are given of persons who have attributed their whole success in life to their attention to this well-established rule. Now-a-days, the proverb requires to be a little more stringent. If we expect to compete successfully in our profession, whatever it may be, it will be necessary not to leave any thing for the next hour, or the next minute, that can be performed in the present—leaving matters till the morrow is now quite antediluvian. Railways, steam-boats, and the penny post, have put mettle in the heels of the public; and he who lags in the old procrastinating fashion—"ay, we'll see about it by and bye"—is pretty certain of getting himself overrun and trampled upon in the onward struggle.

To be serious, the true way of getting through the world with either present or prospective comfort, is to do whatever is required *right slick off*, as the Americans say—not postponing for a single instant what can be immediately executed, unless prudence should suggest a due measure of delay; and such a suggestion, of course, is always to be carefully attended to. A constant exercise in promptitude of execution has a powerful effect in sharpening the wits. The mind of a man who is every minute called on to decide upon a matter of importance, becomes at length exquisitely acute; while he whose mind is little exercised in this way, becomes incapable of decision without long cogitation. A London merchant, for example, who receives a hundred letters in a morning, will decide on the kind of answer to be given to each almost as quickly as they are individually opened, although they may involve matters of thousands of pounds. A country gentleman would probably require a week for each, and, after all, probably leave some altogether unanswered. We have never gone to the country without observing this kind of procrastination. A small job that might be done in five minutes, will be pushed off for a day or two, and made a matter of serious consideration. In this dawdling way, thousands of men dream away their existence, and are just as poor and miserable at the end of their days as they were at the beginning.

CORNS—THEIR CAUSE AND CURE.

The invariable and sole cause of corns is *pressure*. It has been so arranged in nature, that, when any unwonted pressure upon any part of the body takes place, a thickening of the cuticle or outer skin ensues in that part, for the purpose, evidently, of affording the required protection. This process takes place as a direct consequence of pressure, for when a part is severely pressed, the flux of particles from the interior of the skin is stopped at the outside: the particles, prevented from there flying off, are accumulated, and added to the thickness. This goes on indefinitely, and it would go on in any part of the body. The cheek of the fairest maiden might in time, by the proper means, be thickened to the consistency of the upper leather of her shoe. On any spot where pressure takes place, the thickening is greatest in the centre. At that particular point, at a certain stage of the process, the cuticle assumes the hardness of horn, and this causes great pain in the tender parts beneath, when the external pressure is further continued—unquestionably a warning of kind Nature that her child has persisted too long in an injurious course, which ought as quickly as possible to be stopped, and retraced.

The remedy is to be effected by means the reverse of those by which the evil has been induced. The pressure must be removed, and the very opposite of pressure must be applied to the place. If, while the pressure is altogether removed, a soft or wet substance be laid upon the part, the hardened cuticle will become soft, and in time fall off; and in the course of the ordinary process of waste and supply which goes on all over the body, a new skin of proper character will be supplied. Generally, it is desirable to adopt a quicker mode of cure. The thick skin may therefore be in the first place pared as much as may appear safe or convenient. Let pressure be at the same time as much as possible removed. After two or three repeated parings under these circumstances, the corn will grow out from the bottom. But the quickest, most convenient, and most certain cure, is, to pare, as above directed, and to bind up the place with a rag soaked in melted candle-grease. In this case the application must be repeatedly renewed, and the paring may also be repeated, if the thickness of the integument will allow of it. At the end of about a fortnight, if there be no counteracting circumstance, the corn will have disappeared. It may be remarked, that, if the part be kept well supplied with the softening application, it may be subjected to considerable pressure, and yet the cure of the corn will proceed. Candle-grease is more suitable than any other oleaginous substance, because it does not so readily become absorbed in the cloth.

Supposing a cure effected, the patient will only be able to prevent the recurrence of the evil, by studying as far as possible to prevent a renewal of that pressure by which it was originally produced; and this brings us to consider the form of that article of dress, which is the chief, if not the only, recognised cause of corns.

Small feet being usually esteemed an important requisite for a handsome exterior, great anxiety is generally manifested, especially by the fairer part of creation, for small shoes. Shoes, therefore, are often worn too small for the natural size of the foot. In this alone we see abundant cause for corns, for a tight shoe inevitably occasions pressure in one part or another. This is, then, an error to be avoided by all persons accessible to rational ideas—while, on the other hand, a too wide shoe is also to be avoided, seeing that it is sure to occasion friction in some particular place, and thus bring about the same evil result. But it is in the form of shoes, rather than in their size, that the evil most frequently lies.

In the ordinary manufacture of shoes, two leading errors are committed. The first is in a too great contraction of the shoe towards the front. If we look at the foot of an infant or a savage for the natural form of the foot, we find that, from the heel forwards, it gradually widens as far as the situation of the little toe, and from that point, instead of contracting equally on both sides, contracts only on one, namely, from the point of the little to the point of the great toe. The foot is indeed an irregular isosceles triangle, of which the front of the toes is the base, the line from the great toe to the heel the longest side, and the line from the little toe to the heel the shortest side. Instead, however, of making shoes in any thing like this form, they are made with a lozenge-shaped front for elegance, thus crushing the toes into a narrow angular space quite unsuited for their reception. The evil is increased by the second of the two great leading errors—the elevation of the heel. It seems strange that, while the exquisite adaptation of all nature's works to purposes and circumstances is so often the theme of remark, no one ever thought of asking why, if high heels were convenient to mankind, nature did not make them so. For certain, if such a peculiarity of structure had been conducive to our good, we should have found ourselves possessed of it. But the truth is, that, so far from being conducive to good, it is quite the reverse. When we put something under our heels to raise them permanently an inch above the level of the ball of the foot, we lose the power of our limbs to an immense extent. The body is thrown *off* some of its strongest supporting muscles, *upon* some of the weakest, namely, those in front of the limbs. The posture becomes constrained, difficult, and imbecile. Free and forcible motion is impossible. No graceful dancing could be executed under such circumstances. In the case of a gladiator or a wrestler, it would decide the day against a man considerably stronger by nature than his antagonist. Its worst effect, in our ordinary modes of life, is to wedge the foot deeply into the angular recess prepared for it in the fore part of our common shoes, and thus to expose it in its tenderest part to all the pressure which it seems possible by any convenient means to create in that region. From this peculiar cause, perhaps, arises the greater part of the calamity of corns.

We do not point out these errors, with any hope of seeing them quickly corrected. There are, however, some rational persons who, if we shall have succeeded in convincing them, may be expected to sacrifice fashion, in some considerable measure, to convenience. They may not altogether and at once go the length of banishing heels from their shoes, and having those articles of dress made in the form of isosceles triangles; but they will at least lower the heels, and widen the fronts of their shoes, as far as they can without making themselves appear odd. It is not unworthy of remark in this place, that the Highlanders of Scotland in former days had no heels to their shoes, to which circumstance may probably be attributed in no small measure the graceful freedom of their motions, and their amazing powers as pedestrians.

A FEW WEEKS FROM HOME.

NEWCASTLE.

Newcastle, in which we have now arrived by the railway from Carlisle, may be described as in a state of transition from a general meanness, or at least mediocrity of aspect, to a condition of great elegance and convenience, indicative of a wonderful spirit of improvement, and of advance in a course of thriving and profitable industry. Some seven or eight years ago, we had made a passing visit to the place, and observed that it had little to distinguish it from some other English provincial towns, whose plain brick edifices are rendered dingy by age, and the volumes of smoke which usually canopy their black-puddled streets. At that period, however, Newcastle was beginning to manifest symptoms of improvement; in one part of the environs, several rows of smart yellow-coloured brick houses were springing up as places of residence for the more affluent class of inhabitants, and nearly in the centre of the town, a large and handsome stone structure had been erected, embracing an arcade of elegant proportions, with lines of shops and a number of public offices. Since that period, a surprising change has been effected. A kind of new town, built of beautiful light sandstone, resembling the better parts of the New Town of Edinburgh, has been placed in the centre of the old; and as the improvements are still incomplete, the houses of various crooked streets and alleys seem in the course of being pulled piece-meal to the ground and cleared away, while fresh and gay lines of building, ornamenting the newly opened broad thoroughfares, are taking their place. Some little account of this destruction and re-edification of the metropolis of the northern counties, can scarcely fail to be read with interest.

Those who have never been in Newcastle, may readily imagine the Tyne—here a noble river, double the size of the Clyde at Glasgow—issuing from the beautiful fertile valley on the west, through which we have described the railway as passing, and pursuing its course between high sloping banks towards the east. At the point where the river becomes rather closely overhung with rising grounds, are built the towns of Newcastle and Gateshead, the former on the north, the latter on the south bank, and both stretching upwards from the connecting stone bridge over the superior grounds. The situation on the northern side had been in early times selected by the Roman generals as a commanding point for one of their chief stations along the line of wall from the Tyne to the Solway. During the middle ages, a considerable monastic institution, which helped to attract inhabitants, was planted on the spot, and conveyed to it the name of Monkchester; but this designation was dropped when Robert, the eldest son of William the Conqueror, erected a fortress on the high bluff which overhangs the Tyne, and gave it the name of the New Castle, in contradistinction, it is presumed, to the older castle of Prudhoe, now in ruins farther up the valley of the Tyne. From this time, or about the beginning of the twelfth century, the town grew apace under the shel-

Digitized by Google

ter of the castle, was strongly walled to protect it from the warlike incursions of the Scots, and received from successive kings and Northumbrian princes various privileges. The situation of the town on the river, also, gave it a great advantage over less favoured towns near the Scottish border. We find that, as early as the fourteenth century, it was already noted for its maritime traffic; for in 1346, it furnished 17 ships and 314 men to carry on the siege of Calais. Its prosperity received frequent checks from plagues, onslaughts, and various other tragical circumstances incidental to an age of ignorance and strife; yet its natural or acquired advantages carried it over all difficulties, and rendered it one of our most busy and wealthy provincial towns.

The main cause of both its increasing trade and population, is its fortunate situation in the midst of the great coal-district of Northumberland and Durham, or a large tract on both sides of the Tyne, which affords an ever-ready depôt for shipping, and an outlet for a most extensive traffic. The distance of Newcastle from the sea is only about ten miles, and the volume of water in the river at favourable times of the tide, is sufficient to float craft of from four to five hundred tons burden, up to the quay that bounds the lower part of the town. The coal-field of Newcastle is reckoned to extend to a medium length of 44 miles by 21 miles, forming an area of 924 square miles; and, after making all allowances for breaks or defects, it is understood that over this vast space there is an average depth of ten feet of coal. Deducting a sixth for what is already consumed, there remain upwards of seven billions of tons, which, at the rate of 5,235,602 tons exported per annum (that being the quantity for 1837), will afford a supply for 1450 years. The strata amidst which the coal seams are found, are chiefly sandstone and limestone, with ironstone at no great distance, so that the subterranean wealth of the district cannot be considered as limited to one article. The sandstone, as all the world knows, forms a first-rate material for grinding stones; the lime is of great value for agriculture and other purposes; and the ironstone is now, in some places, beginning to be worked on a large scale for smelting. With an abundance of coal and iron, two of our most valuable materials in the arts, and the best means of export, it would have been surprising if Newcastle and its neighbourhood had not assumed the importance which they now enjoy.

From the lower portion of Newcastle, on the bank of the river, where the business in shipping is carried on, a steep street ascends to the higher town, making in its course a bend round the base of the knoll on which the ancient fortlet or castle is placed, and still in a well preserved condition, with a conspicuous turret rising from the mass of antique buildings which parasitically surround it. All the lower department of the town, consisting of business streets and factories, remains in its former state, and it is only on emerging from this quarter, and coming to the central thoroughfares, that the nature and extent of the alterations are observable. Northwards from the old principal cross street, in which stands the church of St Nicholas with its high and elegant tower, the improvements are chiefly to be found. At the time of our former visit, a secluded area of ground, measuring twelve acres in extent, and which belonged to the monastery or nunnery already referred to, was unappropriated for any useful purpose; and at a short distance from it, there was a large market for meat, vegetables, &c., besides a considerable cluster of houses of a mean order. From the central district, the town expanded, by slow degrees, in a northerly and westerly direction, leaving the large monastery grounds in the condition of an unprofitable wilderness, in the heart of a busy seat of population. Many efforts were made to purchase and render useful so valuable a property; but, from being in the hands of a party unwilling to dispose of it, all such attempts proved unsuccessful. At length, it came into the possession of a proprietor who was willing to sell it, and it was purchased in 1834, for the sum of L.50,000, by Richard Grainger, an architect, who had already signalised himself by effecting various improvements in the town.

Mr Grainger—as we learn from a memoir of his life in the Penny Magazine, written, we believe, by Miss Martineau—was born in Newcastle in 1798, and such was the humble condition of his parents, that he was educated at a parish charity school. In early life, he was remarkable for nothing but the serenity of his disposition, which has been his characteristic through life. Some of the inhabitants of Newcastle can recall the appearance of the boy in those days, in his green badge-coat, with his round, ruddy, smiling countenance, and his singularly quiet manner. At the proper time, he was apprenticed to a house-carpenter and builder, and won some attention by the remarkable steadiness and easy composure of his character, giving promise of respectability, and indications of power of mind. When his apprenticeship had expired, his elder brother George, who was a bricklayer, engaged him to join in an enterprise of his own, pulling down and rebuilding a small house. George died prematurely, and Richard being thrown on his own resources, was patronised by Mr Batson, an opulent member of the Methodist body, to which the young builder belonged. By Mr Batson he was employed to build some houses in Higham Place; and soon after he married a respectable and worthy young lady, with a fortune of L.5000. Afterwards, he undertook, on his own account, the erection of several new buildings, mostly, however, of brick, and in the plain style in which English towns are ordinarily constructed. Some of his structures were of a more elegant and important kind, among which was the Arcade, already noticed, which alone cost L.40,000. His various undertakings, up till 1832, are reckoned to have required an outlay of L.195,000.

It may easily be supposed that these expensive speculations were only warranted by the growing prosperity of the town, and the natural demand for a better class of dwellings, shops, and warehouses, than had hitherto existed. Circumstances, as in the similar case of the New Town of Edinburgh, required the change, and to Mr Grainger was given the tact to take advantage of them. The achievements of this bold designer, were, however, only commencing. Having, in 1834, purchased the monastery grounds in the centre of the town, and bought up other old property adjacent, to the amount of L.45,000, he brought forward a well-matured plan for opening communications by handsome new streets through the district, so as to connect some of the busy parts of the town, distant from each other, and which could only be reached by inconvenient circuitous ways. In the lines which he proposed to execute, were placed the market and theatre; but, by certain arrangements, these were removed, leaving a large space open for thorough improvement. Mr Grainger engaged to build a new theatre, and to furnish a new market on a far more splendid scale than the old one, on receiving an adequate remuneration from the corporation. In August 1834, he began his operations, which were rapidly, and without the aid of an act of parliament, carried into execution. The new market was opened in October 1835. These extraordinary proceedings, which were generally popular, did not escape opposition; but by Mr Grainger's sound judgment and activity, all obstacles disappeared. His removal of the theatre was threatened with an injunction; but within three hours from sealing the contract, the chimneys were down, and before any message could have reached London, the whole edifice had disappeared. Another instance of Mr Grainger's Bonapartean promptitude has been mentioned. "A house in Grey Street projected in an unsightly manner, so that it became of importance to the architect to get possession of it. The different owners of the house and cellar made difficulties, and Mr Grainger was longer than usual in carrying his point. At last he succeeded, but not before the contract had interested the inhabitants, who amused themselves with watching whether the architect's design was to be injured by the projection of this one house. The purchase being effected, the tenant's family were, that very evening, removed to a house which Mr Grainger had made comfortable for them, and their fires were still burning when the demolition of their late dwelling began. In the morning, when crowds came to see how the affair proceeded, not a vestige of the house remained."*

Other difficulties consisted in planning and executing levels, for the scene of operations is principally a gentle slope, with a southern exposure, in the middle of the town, and in its former condition it had numerous heights and hollows which it was necessary to transform into an even surface. The digging and carting, exclusive of the cost of deposit, amounted to L.21,500. Sand was procured from some parts of the ground, and in other places the clay was adopted for making bricks. The plans for laying out the new streets involved great artistic skill; but all were projected solely from Mr Grainger's own conceptions and experience, with the assistance of his observations during a visit to Edinburgh, London, and Dublin. He attributes much, we are told, to a visit to Edinburgh many years ago; what he saw there gave him great delight and a powerful impulse. To carry those plans into execution required an enormous capital, and it cannot be supposed that any one individual could have been found to peril so much money on a series of architectural creations, however ostensibly useful. In this department of his undertakings, it is understood that he was powerfully aided by Mr Clayton, town-clerk, and a member of a very opulent and influential family. Through this gentleman's personal and professional assistance, Mr Grainger was enabled to work out his plans; and as many of the new houses were sold or let as soon as they were erected, a much smaller active capital served the purpose than would have been otherwise required.

The result of Mr Grainger's proceedings, as it at present appears to a stranger, has been the erection of eight or ten new streets, varying from about 80 to 500 yards long, and consisting of houses whose fronts are built entirely of a fine yellowish sandstone. The houses rise generally to a height of four floors, reckoning the ground story, and the principal lines are in a most elegant style of architecture, with corner and central buildings of a superior order, and embellished with lofty Corinthian pilasters and cornices. Some of the streets are designed as private dwellings, with sunk areas and railings; but the main division, to which most attention is directed, consists of houses rising from the street, with a ground-floor of shops, and bearing a close resemblance to the buildings of West Strand in London. The names of these principal thoroughfares are Grey, Grainger, Market, Blacket, and Shakspeare Streets. These, as well as other streets, do not run parallel to each other, but are accommodated to the nature of the ground; one makes a bend, so as to present the convex and concave sides of a crescent, and three form a triangular mass of building; and this may be considered the centre of attraction in the newly-modelled district. At the mutual termination of two streets which constitute the triangle, is erected a tall column in honour of Earl Grey, resembling the Melville pillar at Edinburgh, and surmounted by a statue in stone. This handsome structure, which was finished in August 1838, during the meeting of the British Association, makes a good appearance in the general external view of the town, in conjunction with the crown-like tower of St Nicholas and the finely proportioned spire of All-Saints.

In the central part of one of the new lines of street, the new theatre has been erected. It exhibits a portico in front, of the best architectural taste, resting on a row of Corinthian columns, forty-one feet in height. The projection of the portico over the pavement has been objected to as a blemish in the street, but in reality it is a beauty, for it relieves a flat sameness in the lines of buildings, and offers a pleasing break for the eye to rest upon. The theatre in its interior accommodation is rather smaller than that of Edinburgh, but is more elegantly fitted up, and is well supported. We can speak with pleasure of a remarkably well performed piece in the standard and respectable drama, on one of the evenings during our residence in the town. The manager, Mr Ternan, with his wife (late Miss Jarman), sustain this department of the public amusements of Newcastle with great credit to themselves and satisfaction to their audiences.

In the lines of new streets, there are various banks and other establishments of local importance, but none of these demand our notice except the Central Exchange and public market, two establishments each unrivalled in its way. The Central Exchange occupies the interior of the triangular mass already noticed, the facing of which is Grey, Grainger, and Market Streets. The main entrance is undistinguishable in the line of houses, and it is only on going through a lobby that the grandeur of the place is apparent. The interior is a semicircular area, measuring 150 by 95 feet, with a corresponding height, and powerfully lighted by a great number of windows in the roof, supported on flying buttresses. We enter by the flat side of the semicircle, and are immediately struck with the great extent of floor of tasselated pavement, the lofty pilastered walls, the vast roof with its numerous beams, pointed and ornamented, and, above all, by the bold design of a semicircular colonnade of fourteen pillars, painted to resemble yellow-veined marble; this colonnade is a main support to the roof, and encloses a space slightly raised and carpeted on the flat side of the structure, and laid out as a news-room, with handsome tables and chairs; thus, there is an open walk of great breadth on the paved floor of the house round the convex side of the colonnade. Opposite the colonnade, a double stair conveys the visiter to an elegantly fitted up tavern or coffee-room, to which there are other entrances from the adjoining streets. Altogether, this Central Exchange is an exceedingly grand structure, more like what one might expect to form a magnificent temple than a place for merchants congregating, and therefore strongly characteristic of that principle of advancement in society which connects elegance and refinement in architecture with other purposes besides the public offices of religion. The institution is well supported; it has now about 2000 annual subscribers at a guinea each; Mr Grainger remains as the proprietor, and for this work alone deserves a high degree of credit.

The public market, which is across the way from the Central Exchange, consists of a quadrangular area of upwards of two acres, all under one roof, and surrounded by the houses of four new streets. It has entrances from the different sides, and, on visiting it, we perceive that it consists of four principal arcades, crossed at right angles by four equally spacious avenues, the whole lined with open shops or booths, and well lighted from the roof; the length of the avenues is 338 feet. The entire length and breadth has a remarkably clean and neat appearance, expressive of a correct taste. In the long and broad hall, or spacious arcade devoted to the sale of vegetables, butter, &c., there are placed, opposite cross avenues, two handsome stone fountains, or jets d'eau, with basins capable of holding three thousand gallons each. To appearance, about half the booths in the market generally are not let, but the others are in full operation. Those who have seen St John's market in Liverpool, may have a pretty good idea of the design of that of Newcastle, which, however, is much more spacious, and infinitely more tidy in external aspect. At another part of the town, opposite St Nicholas'

Church, a new corn market has been erected, greatly to the convenience of farmers and others, who formerly exposed their grain in the open street during all weathers; it is not yet completed, but the covered hall is already in use on market days.

DR COMBE ON THE MANAGEMENT OF INFANCY.—EARLIEST MENTAL EDUCATION.

DR COMBE has added another to the list of his valuable publications, in the small volume of which the title is quoted below.* The prominent merit of the new treatise appears to us to be, that, for the first time, it fully and clearly carries those who inquire respecting the right management of infants, to natural principles. He first expounds "the nature and laws of the infant constitution," and upon these founds the rules which he asks us to obey. Throughout the whole work he keeps this object steadily in view; and so reasonable, accordingly, do the rules appear, that, even where they most diverge from ordinary practice, they seem calculated to make conviction of their soundness almost unavoidable. The composition of the work is marked by the same clearness and simplicity as the former treatises of the same author. As a specimen, we select Dr Combe's views respecting the earliest mental education:—

"* * * At birth, the brain, which during life is not less essential to the action of the internal faculties than the eye, ear, nose, &c., are to the external senses, is so imperfectly and delicately constituted as to be almost wholly unfit for active mental manifestation; and, accordingly, we meet with none except sensation of bodily pain, and the desire for food. Beyond these, scarcely any trace of activity of mind can be detected; and hence sleep, or the negation of mental action, occupies nearly the whole time. The structure of the brain, however, being then extremely delicate, is very easily disordered, and susceptible of permanent injury, which, as in the similar instances of the eye and the ear, may impair the efficiency of its functions to the end of life; or, in other words, induce permanent idiocy or imbecility.

Such is the state of the mind and brain for some time after birth. By degrees, however, traces of extended mental activity begin to show themselves, and the appetite for food is no longer the only instinct which seeks for gratification. The infant, by its looks and smiles, gives indications of awakening consciousness long before it can conceive the nature of the cause by which it is excited. In this way it exhibits, even at a very early age, movements which neither sensation nor experience can explain, and which, as is happily remarked by a late acute and elegant writer, are in truth the signs of its dawning affections. 'Even at the early age of six weeks, when the infant is still a stranger to the world, and perceives external objects so indistinctly as to make no effort either to obtain or avoid them, he is nevertheless accessible to the influence of human expression. Although no material object possesses any attraction for him, sympathy, or the action of a feeling in his mind corresponding to the action of the same feeling in the mind of another, is already at work. A smiling air, a caressing accent, raises a smile on his lips; pleasing emotions already animate this little being, and we who recognise their expression are delighted in our turn. Who, then, has told this infant that a certain expression of the features indicates tenderness for him? How could he, to whom his own physiognomy is unknown, imitate that of another, unless a corresponding feeling in his own mind impressed the same characters on his features. That person near his cradle is perhaps not his nurse; perhaps she has only disturbed him, or subjected him to some unpleasant operation. No matter, she has smiled affectionately on him; *he feels* that he is loved, and he loves in return.'

Here, then, is the true key to the philosophy of infancy, and to the right training of the infant mind. The internal emotions, like the external senses, are distinct from each other, and independent in their action. Present its appropriate object to one whose organ is already sufficiently developed, and it will start into activity, just as the eye does when the rays of light are directed upon the retina. Look at an infant six months old, for example, and observe the extent to which it responds to every variety of stimulus addressed to its feelings. If we wish to soothe it in a moment of fretful disappointment, is it not a matter of notoriety that we succeed by gentle fondling, and singing to it in a soft and affectionate voice? If our aim is to rouse it to activity, are not our movements and tones at once changed to the lively and spirited? When, inadvertently, an acrimonious dialogue ensues between the nurse and any other person in the presence of an infant, is it not a common occurrence for the child to become as uneasy as if the scold was directed to itself, and forthwith begin to cry? If, on the other hand, an affectionate and gentle-tempered mother enters a nursery, and, imagining the infant to be asleep, merely addresses the nurse in the soft tones characteristic of her mind, do we not instantly see the infant waken up, and with a placid smile look around to solicit the notice of its parent? Or, to use one more example, if a disagreeable, ill-tempered, coarse-looking person, happens suddenly to approach an infant, are not the instantaneous results an exclamation of terror, and a clinging to the mother's bosom for protection?

The bearing and importance of these truths would be at once perceived, were parents acquainted with the structure and laws of the animal economy, and with the fact that the mind acts through the medium of bodily organs, to the influence of which it is subjected during the whole course of life. * *

The grand principle, then, to be borne in mind in the moral and intellectual treatment of even the earliest period of infancy, is, that the objects which are specially related to each individual faculty form the natural stimulants of that faculty. Danger is thus the object or natural stimulant of the feeling of fear, and suffering that of the feeling of compassion, just as sound is of the ear, or light of the eye. The child has no choice in the matter. If the natural stimulant of any feeling be presented, that feeling will start into activity, precisely as vision does when the eye is penetrated by rays of light. We cannot by an effort of the will cease to see or hear, so long as light and sound reach the eye and ear; and neither can we prevent the internal feeling from arising when its object is present.

It is a law of the internal faculties, as well as of the external senses, that, when they are repeatedly and appropriately exercised upon their own objects, they gain both in strength, in durability, and in readiness of action. We have seen, that by exercise of this description, the Indian becomes expert in following tracks and distinguishing sounds which the unpractised European cannot detect. By the application of the same principle to the emotions of the mind, and to muscular efforts, the Indian becomes trained to the display of firmness in enduring pain, to the prosecution of revenge, and to dexterity in the use of the bow; and it only requires to be carried farther and more consistently into practice by civilised man, to yield equally marked results in his moral and intellectual advancement. * *

From the principle already laid down, that each faculty is constituted with a distinct relation to objects or qualities as peculiar to itself as light to the eye or sound to the ear, it follows, that when we wish to exercise or strengthen any of them, we must directly excite them to activity by the presentment of their own stimuli; and when we wish to keep in abeyance a faculty which is already too strong, the only effectual way is to withdraw its objects and leave it in repose, in short, to '*lead it not into temptation*.' But for the ready response of the faculty to the stimulus of its objects, temptation would be a word devoid of meaning.

From this proneness of the mental faculty to respond readily to its natural stimulus, it obviously becomes a matter of great importance to the future character of the individual to regulate the circumstances in which he is placed, or the stimuli by which he is surrounded, especially during the very impressionable period of infancy; for with the fact before us, that every feeling or faculty is in this way strengthened by reiterated exercise, it is natural to suppose that many a child owes much of its perverse temper or cheerful disposition to the continued influence of similar dispositions exhibited by the nurse or mother, during the early period of its existence.

After the preceding pages were printed, I became acquainted with an occurrence which so strikingly illustrates and confirms the accuracy of the principle insisted upon, that I cannot refrain from inserting it. A respectable-looking woman made some purchases in a shop in town, in payment of which she presented a five-pound note. The clerk, on examining it, refused it as a forgery. The poor woman took it back with some surprise, and offered another of the same value in its place. It also proved to be forged—some suspicion was excited, and the woman was handed over, in a state of great agitation, to the police. Having failed to account satisfactorily for having the notes in her possession, an inquiry was instituted, and by which it was ascertained that she had been for several years in the service of a gentleman in the country, where she bore a high character for integrity and good conduct. About a year before, she first saw the two notes lying unconcealed among some old papers in her master's room, where they continued undisturbed for month after month, as if forgotten by him. For a long time she never thought of touching them; but at length the desire to appropriate them arose in her mind, as she believed they would never be missed. After resisting the impulse for months, the desire increased so much by the daily stimulus of the object which excited it, that she at last yielded, and subjected herself, for the first time in her life, to the degrading consciousness of guilt. Afraid of detection, she made no use of the notes for some time, but reserved them for the purchase above referred to, and with what result we have already seen. The gentleman had known the notes to be forgeries, and allowed them to remain undestroyed.

Considering the manner in which this poor woman was 'led into temptation,' and her desire of appropriation strongly excited and *educated* by the daily stimulus of its appropriate object—and considering also the fearful moral evil brought upon her in the permanent degradation of character of which she must have been conscious even when undetected—it is impossible not to acknowledge, that she was an object more deserving of pity than of punishment, and that greater blame was due to the person who so carelessly exposed a fellow-creature to such a snare, than to her who fell into it after so long a period of resistance. Had the gentleman been fully aware of the real force of a direct stimulus thus incessantly addressed to any feeling of the mind, he would have felt that his own negligence was not less culpable than its results were unfortunate.

It is astonishing, indeed, from what an early age a faculty will respond to its stimulus, whether that stimulus be direct or only from sympathy. Madame Necker de Saussure gives an affecting example of this fact, which she witnessed in a child of nine months old. 'The child was gaily playing on its mother's knees, when a woman, whose physiognomy expressed deep but calm sadness, entered the room. From that moment the child's attention was wholly fixed on the person, whom it knew, but for whom it had no particular affection. By degrees its features became discomposed; its playthings dropt from its hands, and at length it threw itself sobbing violently upon its mother's bosom. It felt neither fear nor pity; it knew not why it suffered, but it sought for relief in tears.' Facts like these show how careful we should be in duly regulating the moral as well as physical influences by which infancy is surrounded.

It has often been affirmed, that bad temper, strong passions, and even intellectual peculiarities, are communicated to the infant *through the medium of the mother's or nurse's milk*, and that hence it is of great consequence, in choosing a nurse, to select one of a cheerful and amiable character. But, while admitting that the quality of the milk may exert an influence, I am disposed to believe, that the effect upon the child is caused more especially by the natural action of the evil passions stirring up, and, in a manner, educating the corresponding passions in the child. Many sensible people imagine that they may say or do any thing in the presence of an infant, because it is too young to observe or be affected by it. This, however, is a great mistake. It is true that an infant may be unable to form an intellectual opinion on any occurrence; but it is not less true, that, from a very early period, as shown by Madame Necker de Saussure, its feelings respond to the calls made upon them, and thus give a bias to the mind long before the child can exercise any act of judgment. * *

Let us, then, not deceive ourselves, but ever bear in mind, that what we desire our children to become, we must endeavour to be before them. If we wish them to grow up kind, gentle, affectionate, upright, and true, we must habitually exhibit the same qualities as regulating principles in our conduct, because these qualities act as so many stimuli to the respective faculties in the child. If we cannot restrain our own passions, but at one time overwhelm the young with kindness, and at another surprise and confound them by our caprice or deceit, we may with as much reason expect to gather grapes from thistles, or figs from thorns, as to develope moral purity and simplicity of character in them. It is vain to argue that, because the infant intellect is feeble, it cannot detect the inconsistency which we practise. The feelings and reasoning faculties being perfectly distinct from each other, may, and sometimes do, act independently, and the feelings at once condemn, although the judgment may be unable to assign a reason for doing so. Here is another of the many admirable proofs which we meet with in the animal economy of the harmony and beauty which pervade all the works of God, and which render it impossible to pursue a right course without also doing collateral good, or to pursue a wrong course without producing collateral evil. If the mother, for example, controls her own temper for the sake of her child, and endeavours systematically to seek the guidance of her higher and purer feelings in her general conduct, the good which results is not limited to the consequent improvement of the child. She herself becomes healthier and happier, and every day adds to the pleasures of success. If the mother, on the other hand, gives way to fits of passion, selfishness, caprice, and injustice, the evil is by no means limited to the suffering which she brings upon herself. Her child also suffers both in disposition and in happiness; and while the mother secures, in the one case, the love and regard of all who come into communication with her, she rouses, in the other, only their fear or dislike."

* A Treatise on the Physiological and Moral Management of Infancy. By Andrew Combe, M.D. Edinburgh: Maclachlan, Stewart, and Co., and Simpkin, Marshall, and Co., London. 1840. Pp. 376.

FOREIGN ENGLISH.

Some tradesmen in Paris, and other continental cities where the English resort, among various ways of paying court to our countrymen, give English translations of their shop cards, usually printed underneath or at the back of the original. Very odd assemblages of words result occasionally from this practice, when zeal outruns knowledge. Thus the keeper of a cooking shop at Brussels, which has for its sign, "*Au Bœuf à-la-mode*," advertises himself, on the English side of his card, as "J. P. V. —*Board House, at the Fashionable Beef!*" But of all the mystifications in this way that ever fell under our notice, the greatest was contained in a play-bill, which we read not very long ago on the front of the Theatre-Royal at Brussels, where the enigma was the more puzzling because we could scarcely suppose the misprint to be pure blunder. The first piece to be performed that night was announced under the following title:—"MARDE AS AN MARSH HEAR." We may almost defy our readers to guess that this riddle was meant as the English name of an extravaganza called "MAD AS A MARCH HARE!"—*Newspaper paragraph.*

JOHN HAMPDEN AND HIS GRAVE.

JOHN HAMPDEN, one of the most venerated of English patriots, was the descendant and heir of a family of Saxon origin, long settled in Buckinghamshire, and possessed of extensive property both in that and adjoining counties. He was born in the year 1594, his mother being Elizabeth, second daughter of Sir Henry Cromwell, and aunt to Oliver, afterwards Protector of England. In 1609, John Hampden entered Magdalen College, Oxford, and there distinguished himself highly in his studies. Ten years afterwards, he was married to Elizabeth Simeon, heiress of Pyrton in Oxfordshire, and spent some time afterwards in the placid enjoyment of a country life, and of the society of a wife whom he dearly loved. His rank and importance, however, rendered it incumbent upon him to enter parliament in the beginning of 1621. In this new situation, he immediately attached himself to the anti-royalist or popular party; and though he never attained to the very highest eminence as a speaker, his strong good sense, cultivated mind, and resolute spirit, together with the natural influence attaching to him as one of the wealthiest commoners of the country, gave him a degree of prominence in the public eye alike honourable and perilous. In the second parliament of Charles I., when the king resorted to new modes of raising supplies, Hampden suffered a temporary imprisonment, along with others, for refusing his share of the subsidy. Getting more and more deeply embroiled, as time ran on, with his parliaments and people, the king at length attempted to revive an obsolete tax, known by the name of ship-money. On this occasion, "John Hampden (says Hume) acquired by his spirit and courage universal popularity throughout the nation, and has merited great renown with posterity, for the bold stand which he made in defence of the laws and liberties of his country." He resisted, in his own case, the payment of the tax. It was not the extent of the imposition, for the sum amounted to no more than a few shillings, which made this resistance memorable, but the principle which dictated it, and the fact that the nation at large viewed Hampden as a champion who had put himself forward to defend their common rights. The king nominally gained the victory in the legal struggle which followed; but the conviction of his arbitrary purposes was strengthened in the minds of the people to his ultimate ruin.

Hampden's first wife died, leaving nine children, and he married a second time. But he tasted few of the comforts of home and domestic society in his latter days, being constantly engaged in the still darkening affairs of the state. Finally, the king and his parliament came to an open rupture, and mutually took up arms. Hampden, of course, continued to side with the popular party, and in the outset of the civil war, displayed as much courage in the field as he had shown in the senate. But he did not live to see much of this great contest. On the 18th of June 1643, a battle took place between the royalists under Prince Rupert, and the army of the parliament under Essex, at Chalgrave Field, and John Hampden there received a mortal wound. The circumstances attending the receipt of this injury have long been a source of doubt and dispute, and have given origin to an inquiry of a strange and peculiar kind, even in our own day.

Lord Clarendon and the majority of historians, relate that the patriot was "shot into the shoulder with a brace of bullets, which broke the bone," and caused his death "three weeks" afterwards. Hume, following Sir Philip Warwick, narrates that a prisoner taken by the royalists in the action at Chalgrave, "said that he was confident Mr Hampden was hurt, for he saw him, contrary to his usual custom, ride off the field before the action was finished; his head hanging down, and his hands leaning on his horse's neck." Hume also states that he died "some days" after the event. But another account of the fatal injury differs materially from these. It is presented in the following terms in the Earl of Oxford's papers:

"Two of the Harleys, and one of the Foleys, being at supper with Sir Robert Pye at Faringdon House, Berks, in their way to Herefordshire, Sir Robert Pye related the account of Hampden's death as follows:—'That, at the action of Chalgrave Field, his pistol burst, and shattered his hand in a terrible manner. He, however, rode off, and got to his quarters; but finding the wound mortal, he sent for Sir Robert Pye, then a colonel in the parliament army, and who had married his eldest daughter, and told him that he looked on him in some degree accessory to his death, as the pistols were a present from him. Sir Robert assured him that he bought them in Paris of an eminent maker, and had proved them himself. It appeared, on examining the other pistol, that it was loaded to the muzzle with several supernumerary charges, owing to the carelessness of a servant who was ordered to see that the pistols were loaded every morning, which he did without drawing the former charge.'"

In the year 1828, Lord Nugent, being then engaged in writing a memoir of Hampden, and therefore desirous of ascertaining the real cause of the patriot's death, bethought himself of having his grave opened, in the hope that his remains might yet be in a condition to throw some light upon the question. He therefore made application to the Earl of Buckinghamshire (to whom the family estates had descended) for permission to make search for the grave in Hampden church, and to open the coffin and examine the body. Leave to this purpose having been granted by his lordship, and confirmed by the rector, the search took place on the 21st July, in the presence of Lord Nugent, Counsellor (now Lord) Denman, the Rev. Mr Brookes, and nearly twenty others, onlookers and assistants. The circumstances have been thus detailed by an eye-witness:—"It is remarkable that so distinguished and wealthy a family as that of Hampden should never have possessed a private vault for the interment of the respective branches of the family; such, however, is the case; they have, from a very early period, been buried in the chancel of the church, about four feet deep. On the morning of the 21st July, we all assembled in the church, and commenced the operation of opening the ground. After examining the initials and dates on several leaden coffins, we came to the one in question, the plate of which was so corroded, that it crumbled and broke into small pieces on touching it. It was therefore impossible to ascertain the name of the individual it contained. The coffin had originally been inclosed in wood, covered with velvet, a small portion only of which was apparent near the bottom at the left side, which was not the case with those of a later date, where the initials were very distinct, and the lead more perfect and fresher in appearance. The register stated that Hampden was interred on the 25th June 1643; an old document, still in existence, gives a curious and full account of the grand procession on the occasion; we were, therefore, pretty certain that this must be the one in question, having carefully examined all others in succession. It was lying under the western window, near the tablet erected by him, when living, to the memory of his beloved wife, whose virtues he extols in the most affectionate language. Without positive proof, it was reasonable to suppose that he would be interred near his adored partner; and this being found at her feet, it was unanimously agreed that the lid should be cut open to ascertain the fact, which proved afterwards that we were not mistaken. The parish plumber descended, and commenced cutting across the coffin, then longitudinally, until the whole was sufficiently loosened to roll back, in order to lift off the wooden lid beneath, which was found in such good preservation, that it came off nearly entire. Beneath this was another lid of the same material, which was raised without materially giving way. The coffin had originally been filled up with sawdust, which was found undisturbed, except in the centre, where the abdomen had fallen in. The sawdust was then removed, and the process of examination commenced. Silence reigned. Not a whisper or breath was heard. Each stood on the tiptoe of expectation, awaiting the result as to what appearance the face would present when divested of its covering. Lord Nugent descended into the grave, and first removed the outer cloth, which was firmly wrapped round the body—then a second, and a third—such care having been taken to preserve the body from the worm of corruption. Here a very singular scene presented itself. No regular features were apparent, although the face retained a death-like whiteness, and showed the various windings of the blood-vessels beneath the skin. The upper row of teeth was perfect, and those that remained in the under jaw, on being taken out and examined, were quite sound. A little beard remained on the lower part of the chin, and the whiskers were strong, and somewhat lighter than his hair, which was a full auburn brown. The upper part of the bridge of the nose was still elevated; the remainder had given way to the pressure of the cloths, which had been firmly bound round the head. The eyes were but slightly sunk in, and were covered with the same white film which characterised the general appearance of the face. Finding that a difference of opinion existed as to the indentation in the left shoulder, where it was supposed he had been wounded, it was unanimously agreed to raise up the coffin altogether, and place it in the centre of the church, where a more accurate examination might take place. The coffin was extremely heavy, but by elevating one end with a crowbar, two strong ropes were adjusted under each end, and it was thus drawn up by twelve men in the most careful manner possible. Being placed on a trestle, the first operation was to examine the arms, which nearly retained their original size. On lifting up the right arm, we found it was dispossessed of its hand. We might, therefore, naturally conjecture that it had been amputated, as the bone presented a perfectly flat appearance, as if sawn off by some sharp instrument. On searching under the cloths, to our no small astonishment, we found the hand, or rather a number of small bones, enclosed in a separate cloth. For about six inches up the arm the flesh had wasted away, being evidently smaller than the lower part of the left arm, to which the hand was firmly united, and which presented no symptoms of decay, farther than the two bones of the forefinger loose. Even the nails remained entire, of which we saw no appearance in the cloth containing the bones of the right hand. At this process of the investigation, we were perfectly satisfied that, independently of the result of any farther examination, such a striking coincidence as the loss of the right hand would justify our belief in Sir R. Pye's statement to the Harleys, that his presentation pistol was the innocent cause of a wound which afterwards proved mortal. It was, however, possible that at the same moment, in the heat of the action of Chalgrave, when Colonel Hampden discharged his pistol at his adversary, that his adversary's ball might wound him in the shoulder; for he was soon after observed, as stated by Sir Philip Warwick, 'with his head hanging down, and his hands leaning upon his horse's neck.'

In order to corroborate or disprove the different statements relative to his having been wounded in the shoulder, a close examination of the parts took place. The clavicle of the right shoulder was firmly united to the scapula, nor did there appear any contusion or indentation that evinced symptoms of any wound ever having been inflicted. The left shoulder, on the contrary, was smaller and sunken in, as if the clavicle had been displaced. To remove all doubts, it was adjudged necessary to remove the arms, which were amputated with a penknife. The socket of the right arm was perfectly white and healthy, and the clavicle firmly united to the scapula, nor was there the least appearance of contusion or wound. The socket on the left shoulder, on the contrary, was of a brownish coat, and the cavicle being found quite loose and disunited from the scapula, proved that dislocation had taken place. The bones, however, were quite perfect. Such dislocation, however, must have arisen either from the force of a ball, or from Colonel Hampden having fallen from his horse when he lost the power of holding the reins, by reason of his hand having been so dreadfully shattered. The latter, in all probability, was the case, as it would be barely possible for a ball to pass through the shoulder without some fracture either of the clavicle or scapula. In order to examine the head and hair, the body was raised up and supported with a shovel; on removing the cloths, which adhered firmly to the back of the head, we found the hair in a complete state of preservation. It was of a dark auburn colour, and, according to the custom of the times, was very long, from five to six inches. It was drawn up and tied at the top of the head with black thread or silk. The ends had the appearance of being cut off. On taking hold of the top knot, it soon gave way, and came off like a wig. * * * This was the only spot where any putrescence was apparent. * * * He was five feet nine inches in height, apparently of great muscular strength, of a vigorous and robust frame; forehead broad and high, and the skull altogether well-formed—such a one as the imagination would conceive capable of great exploits.

Here I close the narrative—one of singular interest to those who were eye-witnesses of the examination, which presented a scene so novel, so ghastly, but at the same time so full of moment, that it will ever prove a memorable event in the short era of our lives. We recalled to mind the virtuous actions of the deceased, his manly defence against the tyranny of the Star-Chamber, his abandonment of every social and domestic tie for the glorious cause of freedom; and whilst we gazed on his remains, remembered that that voice which was once raised on behalf of his country, had contributed in no small measure to prepare the way for the blessings of liberty, which, but for his warning, might to this day have been withheld from an enlightened people."

MAY MORN.

A VISION.

[BY SWYNFEN JERVIS.]

Shame be to him who sits at home and thinks,
While all the busy world is out a-Maying;
Better by far, upon the flowery brinks
Of streams, that babble as they run, be straying.
It is but one brief hour agone,
Since, with her cloudy mantle on,
And deck'd with brighter jewels than e'er shone
Amid the tresses of an earthly bride,
The fair Aurora I descried,
As up the mountain's steepy side
She flew, as though her soul were in her feet,
High on the topmost verge her lingering lord to meet.
Had you but seen the glow of lovely red,
As o'er her cheek the bright suffusion spread,
And marked her look of innocent delight,
When first his radiant forehead met her sight,
You would have deem'd your happiness complete,
And all the pageantry and state
That on anointed monarchs wait,
Thenceforth a shallow mockery and a cheat.
From his imperial car the god descended,
And with surpassing dignity and grace,
Like some tall statue stooping from its base,
Advanced with eager step to her embrace.
One moment more, and side by side
They sat—the monarch and his bride.
The heavenly car moved on, not unattended,
For smiling Plenty hover'd nigh,
And Joy and Love were there, and Mirth, with half-closed eye.
I saw no more: for 'mid the blaze,
The gathering splendour of encircling rays,
As toward the zenith the bright god of day
Pursued his glittering way,
The glorious vision ended.
And I return'd, to tell in verse
Of scenes which, fitly to rehearse,
Might task the loftiest powers of him
Who sang of heaven's proud cherubim,
And first to our astonish'd eyes,
In strains which for their purpose high
Men "will not willingly let die,"
Unveil'd the charms of Paradise.

—*Spectator, May 2.*

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 440. SATURDAY, JULY 4, 1840. PRICE THREE HALFPENCE.

NECESSARIES AND LUXURIES.

THE indefiniteness of the range of human wants is matter of such notoriety, that we do not need in this place to expatiate upon it. But it may be allowed us to remark, for the sake of argument, that the number and variety of the things which a person in tolerable circumstances requires to make his life comfortable, *is* very great. It is much greater than most people who have not reflected on the point are probably aware of, including as it does all the various things eaten and drunk, all the various things worn, all the various furnishings of a house, the services of various kinds performed by attendants, the gratifications of taste, and the various visitings and recreations, which are more or less frequently indulged in. No one would, if strictly questioned, say that all of these things are necessaries; but most people act and feel as if they were so. The loss of any of them would occasion a blank, which would excite much immediate discontent, and to which it would require a long time to reconcile us. A lady whose health was such as to forbid her a whole winter's balls, would expect to be heartily sympathised with, although the home to which she was confined might be supplied with every other possible luxury. A gentleman who smokes cigars would, if denied that regalement for a single fortnight, be apt to take the matter very grumblingly. On all of those points, the question whether they are necessaries or luxuries, whether dispensable or indispensable, never arises. But that the need for them is really felt is indubitable, and therefore they may be surely described as practically regarded by those who use them as necessaries.

Yet amongst these very people there is an abstract idea of *necessaries*, quite different from that which seems to reign over their own practice. This abstract idea is much the same as that of the moral poet, "meat, clothes, and fire." When they dream of an anchorite, they allow him nothing but "meat, clothes, and fire." Perhaps he is even restricted to vegetable diet. Water is certainly the only necessary beverage—

"His food the fruits, his drink the crystal well."

Nor is this allowed to be a mere abstraction, or a material for furnishing out the picture of a hermit, but it becomes a real measure for what is to be dealt out to actual human beings in all circumstances of an unfortunate nature. In most cases, for example, a pauper is held to be sufficiently provided for, if he obtains "meat, clothes, and fire"—that is to say, a plain and perhaps unvaried diet, a coarse but sufficiently warm dress, and house shelter. There is no thought in his case of even the simplest of those innumerable appliances and indulgences which constitute the fortunate man's idea of what is necessary to himself. What is indispensable to sustain immediate existence is given, but nothing more—that is, let us always remark, in the generality of cases, for in some there is greater liberality. Our ordinary ideas respecting a mendicant are of the same kind. We are anxious that he should not starve, either of hunger or cold; but if he is supposed to be supplied with the means of doing any more than merely keep in life, he is thought to have too much, and if he spends any part of his receipts on articles not strictly necessary for his support, woe to him the next time he applies for an alms. It is expected of a mendicant—and indeed this may be said of the unfortunate and reduced in general—that no sort of enjoyment should ever come his way. To think of a beggar having even a hearty laugh by the evening fire in his mean lodging, seems wrong and out of character. If he for a moment lays aside his poor look and his whine, he becomes a base deceiver in our eyes, and we resolve to button up for ever against his whole fraternity. These ideas are perhaps not unnatural, and they are not brought into notice here with any design of reflecting discredit on those who entertain them. It would be unreasonable for those dependent on the productive part of the community, to expect to have the same indulgences as those on whom they depend. Those who produce may be fairly allowed to have a right to consume what they produce, though that may involve many superfluities; while those who consume without producing any thing, may as fairly be expected to be content with a narrower range of indulgences. Our object is to enlighten, not to ridicule or blame.

It appears, then, to us, that, whether or not men's ideas of what is necessary to themselves be too wide, their ideas of what is necessary for the unfortunate, or for those whom they take under their protection, are generally too narrow. They are deceived by finding that simple food, clothing, and shelter, are alone required for the *immediate* support of life. They see these things keep in the breath from one day to another, but do not reflect that to maintain a healthy existence for a *considerable space of time* may require something else—some part, in short, of those indulgences which they do not deny to themselves. That such is really the case, is, we think, rendered extremely probable by various considerations, and by none more than the universal anxiety which exists for something beyond simple unvaried food, and clothes and shelter. It is found that no one whatever, except he be a fanatic of some kind, rests content with that range of necessaries, if he can obtain any thing beyond it. Whether we look to revenue returns, or to the behaviour of individuals, we have this all-pervading desire strongly impressed on us. There are some, it is true, who hesitate not to speak of the millions spent on tea, tobacco, and such articles, as so much money thrown away; but thus to set up a solitary opinion against the actual choice and practice of an immense nation, argues perhaps more self-esteem than reflection. The nation, in spending these sums, must surely feel that it has an equivalent for them; and what is this equivalent but the gratification of certain cravings or needs? Perhaps the articles consumed are not those suited to gratify these cravings either most agreeably or most harmlessly: there may be others which providence has designed to give that gratification, without any drawback of injury to the physical or moral nature of the people. But these things must be held as an exponent of the cravings nevertheless, and that is sufficient for the argument. With regard to individual illustrations, no one who has a personal acquaintance with the less affluent or fortunate classes, can hesitate to acknowledge the eagerness with which the poorest poor grasp at little indulgences beyond the "meat, clothes, and fire." We will not here speak of the more debasing of these indulgences, though even of them were we to speak, it would be more in sorrow than in blame. Let us only notice those which cannot be said to do any great or immediate injury, while unquestionably they minister to the gratification of some existing appetites or tastes.

We once knew an artisan who realised only seven shillings a-week by his labour, and who had little other income wherewith to support his household. His family had grown up and ceased to be a burden to him; but his wife remained, and seven shillings was but a poor income for the weekly support of two persons. He was a rigidly honest and prudent man, disposed to fulfil, and who had fulfilled, all the duties of life creditably. He allowed himself no relaxation from constant labour. He took no food between six in the evening and nine next morning, though before nine he always wrought three hours. There could not be a more interesting example of self-denial in a lowly walk of life. Yet this man spent fourpence every week upon tobacco. He told us that he had often debated with himself the propriety of cutting off this last remnant of the little comforts of better days, but he never had been able to do so. We feel certain, from his whole character, that, if he could have dispensed with the tobacco without a very great and very distressing sacrifice, he would have done so; he was quite the man to have made any sacrifice at the call of high principle. But sensation in this matter overcame principle. He, in short, could not want this small modicum of tobacco. Before we knew of this case, we were disposed to censure working-men of small wages for using tobacco, but we have never been since. Again, how anxious are the aged poor of the female sex generally found to obtain the occasional treat of a little tea. The tincture of this leaf seems totally innutritive, and therefore useless to the poor; yet there is no solid which they prefer to it. Give any poor old woman a trifle of money, and it is ten to one that she goes and buys a few pennyweights of tea, although she may be at the moment in the most pressing need of more substantial provisions. This seems the height of foolishness; but can we be quite sure that we know best? A friend of ours knew an old female in the country, who, whenever she could command a little tea, *locked her door* to keep out all intruders while she regaled herself with it. Surely there must be some grave cause for circumstances like these. Is it not the voice of some natural principle which cries thus loud within the old and feeble? In the workhouse of our own city, the food given is of a very monotonous kind, though perhaps sufficient in point of quantity. It is common to see one of the poor inmates creeping along from a neighbouring shop, with a single salt herring in his hand, purchased with some accidentally acquired halfpenny. It may be said, what need of this herring, when he every day has a dinner of soup made from ox-heads, with a loaf? But a natural principle prompts the monotonously fed old man to seek for some relishing variety to his fare; and a salt herring is of that character. Those who feed every day on the best, with ample variety, do not detect the principle; but the poor man who dines day after day for years on one mess of soup-maigre, discovers it. Is it not reasonably to be inferred that the rich would find reasons for a great many other preferences, and tastes, and habits in the poor, which at present astonish them, if they were to take a trial for a while of the *condition* of the poor?

The drift of all these remarks is to impress, if possible, a more liberal sense of the *needs* of unfortunate human beings than what at present exists. We should wish to see all who have any charge over the poor, disabused of the erroneous notion that life can be quite well sustained by the barest necessaries, when in reality something farther and various is required. We should wish that the rich would not think ill of the poor, or be cooled in their efforts to do them good, because the poor are disposed to indulge in some of those comforts which the rich themselves enjoy in abundance, seeing that it is an imperative law of our nature to desire such comforts, which accordingly cannot be permanently withheld altogether without some evil ensuing. A benevolent person who wishes to sustain some of his poorer neighbours may think that he does a great deal if he supplies bare daily necessaries: he certainly does much, but let him not suppose that he extends a full support to his dependants, when he withholds things which, with regard to extended years, are as pressingly necessary as bread is for each day.

Comforts in food or other articles of consumpt, are not alone to be regarded here. There are solacements for the mind which are not less necessary for a healthy existence. Amongst these may be reckoned occasional recreations and sports, indulgence in cheerful society, reading, and an exercise of the feelings which have a regard to the world beyond the present. Many a person would suppose that he did enough for a being dependent on his generosity, if he provided a sufficiency of animal comforts alone; but this is a great mistake. There is as great a certainty of derangement and discomfort, if a cheering intercourse with the world be withheld, as if we denied some immediately requisite article of food: it only takes a longer time to realise the result in the one case than the other. And similar effects follow from deprivation of the other elements of comfort. We shall see these matters in a clearer light, if we once reflect what a complex being man is, how many sentiments, affections, and powers, exist in his frame, all calling for exercise on the various things in the world and out of the world, which they have a respect to. How preposterous to suppose that this strange bundle of clamorous appetites and faculties is to be kept sweet by the mere administration of a certain amount of food, or even by the addition of a few luxuries! The whole being must be kept in a condition appropriate to its character in all its various parts, before there can be any approach to contentment of an unaffected kind, and before we consequently can expect such moral results as may be regarded with satisfaction.

THE PRISONERS OF MOUNT CAUCASUS.

CONCLUDED.

The key of the irons not being found, all that had been done for the liberation of Major Kascambo seemed to have been done in vain, unless the irons could be broken. Ivan, with the corner of the axe, managed to loosen the ring attached to the hand, but that fixed to the foot resisted every effort; he was afraid of hurting his master, and did not dare to use all his strength. On the other hand, the night was advancing, and the danger was becoming pressing: they resolved to depart. Ivan tied the chain firmly to the major's belt, so as to annoy him as little as possible, and to make no noise. He placed in a pouch a quarter of mutton with some other provisions, and armed himself with the deceased's pistol and dagger. Kascambo took his bear-skin cloak; they went out in silence, and, turning round the house to avoid meeting any one, they struck into the hills without following the ordinary road to Mosdok, supposing that they would be pursued in that direction. They skirted for all the rest of the night the mountains on their right, and when daylight began to dawn, they entered a beech-wood, which crowned the summit of the hill, and screened them from the danger of being discovered at any distance. It was in the month of February: the ground on those heights, and especially in the forest, was still covered with hard snow, which offered a firm footing to the travellers during the night and part of the morning; but towards noon, when it became melted by the sun, they sunk at every step, which made their progress very slow. After a most painful and most difficult march, they arrived at the side of a deep valley they had to cross, at the bottom of which the snow had disappeared; a well-beaten path ran along the windings of the rivulet, and showed that the spot had been frequented. This consideration, added to the excessive fatigue and exhaustion of the major, determined the travellers to remain in that place till night: they established themselves among some isolated rocks which rose from the centre of the snow. Ivan cut a quantity of fir branches to make a soft bed for his master, who lay down immediately. Whilst he was resting, Ivan was reflecting on the safest plan for continuing their route. The valley over which they now stood was surrounded with high hills through which no passage was visible. He saw that the beaten path could not be avoided, and that it was necessary to follow the course of the rivulet to get out of this labyrinth. It was eleven o'clock at night, and the snow was becoming harder and firmer when they descended into the valley; but before starting, they set fire to their establishment, as much to warm themselves as to prepare a small meal of chislik, which they needed much. A handful of snow was all they had to drink, and a mouthful of brandy crowned the feast. They luckily crossed the valley without seeing any body, and entered the narrow pass where the road and the rivulet lay contracted on each side by precipitous hills; they walked on at the utmost of their speed, knowing well how dangerous it was for them to be met in that narrow passage, which they only cleared fairly at nine in the morning. It was only then that this dark defile opened all of a sudden before them, and displayed over the tops of the lower mountains the immense horizon of Russia, spreading itself afar like a distant sea. One could hardly form a true notion of the pleasure the major experienced at this unexpected sight: "Russia! Russia!" were the only words he could pronounce.

The travellers sat down to rest themselves, and to enjoy in anticipation their approaching liberty. This prospect of happiness was embittered in the major's mind by the remembrance of the horrid catastrophe he had witnessed, and which his fetters and blood-stained garments presented in such vivid colours to his imagination. While contemplating at a distance the termination of his labours, he calculated in silence and anxiety the difficulties of the journey. The sight of the long and dangerous route which still remained to be performed, encumbered as he was with irons, and his limbs swollen with fatigue, soon effaced the last trace of the momentary pleasure created by the view of his own native land. The torments of a burning thirst added to the anguish and distress of his mind. Ivan ran down towards the rivulet to bring some water to his master: a bridge formed of two trees was thrown over it, and he saw a habitation at a small distance. It was a sort of chalet, or summer residence of the Tchetchenges, which was deserted. In the situation of the fugitives, that isolated house was a most precious discovery. Ivan interrupted his master's reflections to conduct him to the refuge he had so fortunately discovered, and, after establishing him as comfortably as possible, he proceeded to search for the magazine.

The inhabitants of the Caucasus being often exposed to the incursions of their neighbours, have always near their houses subterranean recesses in which they conceal their provisions and their utensils. These magazines, in the shape of a narrow well, are closed with a plank or a large stone, carefully covered over with earth, and generally placed in a spot where there is no grass, lest the difference of shade should betray the deposited treasure. In spite of all these precautions, the Russian soldiers often find them out. They go over the beaten paths around the habitation, knocking about with the ramrod of their guns, and the sound indicates to their practised ear the cavities they are seeking. Ivan discovered one under a shed close to the house, and found in it some earthen jars, a few stalks of maize, a bit of crystal salt, and several house utensils. He ran for some water to begin cooking: the quarter of mutton, with some potatoes he had brought, were placed on the fire. During the preparation of the dish, Kascambo roasted the stalks of Indian corn, and some nuts, found also in the magazine, completed the meal.

Ivan, having now more time and more means, succeeded in freeing his master entirely from his fetters, and the latter, now more composed and more calm, and, besides, well restored by a meal excellent under present circumstances, fell fast asleep, and the night had quite closed in when he awoke. Notwithstanding this favourable rest, when he wished to resume his route, his swollen legs had stiffened to such a fearful degree, that he could not make one movement without experiencing intolerable agony: it was, however, necessary to depart. Supported by his servant, he started mournfully, convinced that he should never reach the term so ardently wished for. The motion, however, and the heat of the walk, calmed by degrees the pain he suffered. He walked all night, halting frequently, and almost immediately continuing his journey. But sometimes giving way to despair, he would throw himself on the ground, and entreat Ivan to abandon him to his fate. His intrepid companion not only encouraged him by his speeches and example, but employed almost violence to raise him to his feet and drag him off. They came to a most difficult and most dangerous passage, which they could not avoid; to wait for daylight would have caused an irreparable loss of time. They resolved to go through, at the imminent hazard of being precipitated from the heights. But before engaging his master in this peril, Ivan resolved to reconnoitre the pass, and to survey it alone. While he was going down, Kascambo remained on the edge of a rock, in a state of anxiety by no means easy to describe. The night was dark: he heard under his feet the distant murmur of a rapid river, whose agitated waters were rolling tumultuously through the valley; the noise of the stones detached from the mountain's side by his companion's feet, indicated to him the immense depth of the precipice on which he was standing. At this moment of anguish and of distress, which might be the last of his life, he thought of his beloved mother, who had given him her blessing at his departure from the line, with that tender maternal affection which no other love can ever equal; that thought renewed all his courage: a pleasing presentiment that he should once more see her arose in his mind. "Merciful God!" he exclaimed; "do grant that her blessing shall not have been given in vain!"

As he was just finishing this short but fervent prayer, Ivan returned. The passage was not so difficult as they had at first supposed it to be. After descending a few fathoms between the rocks, it was necessary, in order to gain easier ground, to skirt a narrow ridge of rock, inclined, and, besides, covered with slippery snow, under which the mountain formed a steep and abrupt precipice of fearful depth. Ivan made openings in the hard snow with his axe to facilitate the passage; they both commended their souls to God. "Now," said Kascambo, "if I perish, let it not be for want of courage; sickness and misery alone could ever damp my spirits; I shall go now as long as the Almighty will give me strength." They surmounted all difficulties, successfully accomplished their perilous passage, and continued their route. The paths were becoming more frequented and well beaten; they only found snow in the spots exposed to the north wind, and in the hollows where it had gathered. They had the good fortune to meet no one till day-break, when the sight of two men, who appeared at a great distance, obliged them to lie down flat on the ground to avoid discovery.

After leaving the mountains in those provinces, the forests disappear, and the eye looks in vain for a single tree to relieve the nakedness of the country, except on the banks of large rivers, where they are even very scarce: this circumstance is very extraordinary, considering the fertility of the soil. They had been following for some time the course of the Sonja, which they had to cross to reach Mosdok, and were looking out for a spot where the stream, being less rapid, would afford them a safer passage, when they discovered a figure on horseback coming straight towards them. The country, totally uncovered, presented neither tree nor bush for concealment. They squatted down under a ridge of rock near the water's edge. The traveller passed within a few yards of their hiding-place: their intention was merely to defend themselves if they were attacked. Ivan drew his dagger, and gave the pistol to the major. Perceiving, however, that the rider was but a boy of twelve or thirteen, he sprang abruptly on him, seized him by the neck, and threw him down. The youth attempted to resist; but on seeing the major appear at the river side, pistol in hand, he ran away at full speed. The horse was without a saddle, and with only a halter passed in his mouth by way of a bridle. The two fugitives made use immediately of their capture to pass the river. This rencontre was most fortunate for them, for they very soon saw that it would have been impossible to cross it on foot as they intended. Their charger, although burdened with two men, was very nearly carried away by the rapidity of the stream. They reached the shore, however, in safety, but it was too steep to allow the horse to land; they dismounted to ease him. As Ivan was pulling him with all his might to make him climb the bank, the halter gave way. The poor animal was carried off by the current, and, after many an unsuccessful attempt to land, was fairly overpowered and drowned.

Deprived of this resource, but less tormented now by the fear of being pursued, they made for a rocky hillock, which they perceived in the distance, intending to hide there, and rest till night. By their calculation of the distance they must have gone over, they judged that the habitations of the Pacific Tchetchenges could not be very far away. But it was by no means safe to trust to these men, whose possible treachery would ruin them for ever. However, in the desperate state of weakness to which Kascambo was now reduced, he could not reach the Tereak without assistance. Their provisions were exhausted; they spent the rest of the day in sullen and mournful silence, not daring to communicate to one another their mutual anxieties. Towards the evening, the major saw his denchick strike his forehead with his hand, and give a deep sigh. Surprised at this sudden mark of despair, which his intrepid companion had never yet displayed, he inquired the cause of it. "Master," said Ivan, "I have committed a great fault!"

"May God forgive it us!" replied Kascambo, with great compunction.

"Yes," continued Ivan; "I have forgotten to carry off that splendid rifle, which was in the child's room. But it cannot be helped; it did not occur to me; you made such a moaning up there, that you put it out of my head. You laugh; it was indeed the prettiest rifle in the whole village. I would have made a present of it to the first man we meet to make a friend of him, for I do not exactly see how we can, in your present condition, accomplish our journey."

The weather, which had hitherto favoured them, changed suddenly in the course of the day. The cold wind of Russia blew with violence, and covered them with sleet. They started again at nightfall, uncertain whether to risk entering one of the villages, or to avoid them entirely. But the long journey which on that alternative awaited them, became utterly impossible in consequence of a new misfortune which happened to them towards the end of the night.

As they were crossing a small ravine, on a wreath of snow which covered the bottom of it, the ice broke under their feet, and they sunk up to the knees in the water. The efforts Kascambo made to extricate himself, completely drenched his garments. From the moment of their departure the cold had never been so intense; the whole country was covered with sleet. After half an hour of the most painful and laborious travel, nipped by the cold, he fell down, exhausted by fatigue and pain, and refused peremptorily to go a step farther. Convinced of the utter impossibility of ever reaching the term of his journey, he considered it an useless cruelty to detain his companion, who could easily escape alone. "Listen to me, Ivan," said he; "God knows I have done every thing in my power till this very moment, to take advantage of your help and assistance; but you see now that they cannot save me, and that my fate is sealed. Go to the line, my dear and faithful Ivan—return to our regiment, I command you; tell my old friends, and my superior officers, that you have left me here a prey to the ravens, and that I wish them a better fate. But, before leaving me, remember the oath you took up there in the blood of our jailors. You swore that the Tchetchenges should never take me alive again: keep your word!" So saying, he lay down, and covered himself all over with his bear-skin cloak. "There is still a resource left," replied Ivan; "it is to seek a habitation of

Tchetchenges, and bribe the master with promises; if he betray us, we shall have nothing to reproach ourselves with. Try to drag yourself so far; or," said he, seeing his master's exhaustion, "I shall go alone, and try to gain over a Tchetchenge; if things turn out well, I shall come back with him, and carry you away. If they go wrong, if I perish and cannot return, there, take the pistol." Kascambo stretched out his hand, and took the pistol.

Ivan covered him up with herbs and brushwood, for fear he should be seen during his absence. He was about to depart, when his master called him back. "Ivan," said he, "listen again to my last request. If you ever succeed in passing the Tereek, and see my mother again without me" ——

"Master," interrupted Ivan, "farewell for a few hours. We shall meet again in the course of this day. But, if you die, neither your mother nor mine shall ever see me again!"

After an hour's walk, he perceived, from a small rising ground, two or three villages, at about four miles' distance: it was not what he wanted; he wished to find a solitary house, which he might enter without being observed, and secretly gain over the master. The distant smoke of an isolated chimney discovered to him what he wished for. The master of the house was seated on the floor, busily repairing one of his boots. "I come here," said Ivan, "to offer you an opportunity of winning two hundred roubles, and to ask of you a service. You have, no doubt, heard of Major Kascambo, a prisoner among the mountaineers. Well, I have carried him off—he is here close by—sick, exhausted, and in your power. If you deliver him up to his enemies, they will praise you certainly, but, you know it well enough, they will not reward you. If, on the contrary, you consent to save him, by keeping him only three days in your house, I shall go to Mosdok, and bring back two hundred roubles in fine sounding silver for his ransom. But if you dare stir one inch from your place," added he, drawing his dagger, "and give the alarm to get me arrested, I murder you this instant. Give me your word this moment, or you are a dead man."

The determined tone of Ivan convinced the Tchetchenge without intimidating him. "Young man," said he, pulling quietly on his boot, "I have also got a dagger in my belt, and yours does not frighten me. Had you entered here as a friend, I should never have betrayed a man who had crossed the threshold of my door; now, I promise nothing. Sit down there, and explain your wish." Ivan, seeing at once who he had to do with, sheathed his dagger, sat down, and repeated his proposal. "And what security do you offer me," asked the Tchetchenge, "for the execution of your promise?" "I shall leave you the major himself," replied Ivan. "Do you think I would have suffered for fifteen months, and brought my master to your house, to desert him there?" "Well, I believe you; but two hundred roubles are too little—I must have four hundred." "Why not ask four thousand?—it's just as easy; only, as I intend to keep my word, I offer you the two hundred, because I know where to get them, and not another kopeck. Would you place me under the necessity of deceiving you?"

"Well, let it be done for the two hundred roubles; and you come back in three days, and alone?" "Yes, alone, and in three days; I give you my word for it; but have you given me your own word?—is the major your guest?" "He is, and so are you from this moment; you have my solemn word for it."

They took each other's hand, and ran for the major, whom they brought back half dead with cold and hunger.

Instead of going to Mosdok, Ivan hearing that he was nearer to Tchervelianskaya-Stanica, where there was a considerable post of Cossacks, hastened directly thither. He had no great trouble in making up the necessary sum. The brave Cossacks, several of whom had been present at the unfortunate engagement which had cost Kascambo his liberty, were happy to put their purses together to complete his ransom. On the appointed day, Ivan departed to go and deliver at last his master; but the colonel who commanded the post, fearing some new treason, would not allow him to return alone; and, in spite of the convention and agreement made with the Tchetchenge, he sent a detachment of Cossacks with him.

This ill-judged precaution was very near being fatal to Kascambo. His host no sooner perceived the lances of the Cossacks in the distance, than he thought himself betrayed; and displaying at once the ferocious courage of his nation, he conducted the major, still weak and sick, to the roof of the house, tied him to a pillar, and placed himself before him, with his rifle in his hand."

"If you advance," cried he, as soon as Ivan was within hearing distance; "if you make another step, I blow the major's brains out; and I have fifty cartridges left for my enemies, and for the traitor who has brought them."

"You are not betrayed!" exclaimed the faithful denchick, trembling for his master's life; "I have been forced to come back accompanied; but I have brought the two hundred roubles, and keep my word."

"Let the Cossacks retire," added the Tchetchenge, "or I fire."

Kascambo himself begged of the officer to retire. Ivan followed the detachment for some distance, and came back alone. But the suspicious brigand would not allow him to approach. He bade him count the roubles on the footpath, at a hundred yards from the house, and be off.

As soon as he had secured them, he returned to the roof, and, throwing himself at the major's feet, begged his pardon, and entreated him to forget the bad usage he had been forced to make him endure for his own safety. "I shall only remember," said Kascambo, "that I have been your guest, and that you have kept your word faithfully; but instead of begging my pardon, I should rather prefer you to take off these ropes."

Without answering, the Tchetchenge, seeing Ivan return, bounded from the roof, and disappeared like lightning.

In the course of the same day, the brave Ivan had the satisfaction and glory of restoring his master to his dear friends, who had lost all hopes of ever seeing him more.

The author of this narrative, happening to pass Iegorievsky some months after, arrived during the night before a small house, of very elegant appearance, and particularly well lighted up. He jumped from his kibick, and approached a window to enjoy the sight of a most lively and animated ball which was taking place on the ground-floor. A young officer was also looking on, and appeared particularly taken up with the gay scene in the interior of the apartment.

"Who gives this ball?" inquired the traveller.

"It is our major, who was married to-day."

"And what may be his name, pray?"

"His name is Kascambo."

The traveller, who was acquainted with the singular history of this gentleman, congratulated himself on having yielded to his curiosity, and admired the bridegroom, who, glowing with pleasure, had completely forgot for the moment the Tchetchenges and their cruelty.

"Have the kindness to show me also the brave denchick who delivered him." The young officer, after some hesitation, answered, "I am the man."

Doubly surprised at this extraordinary coincidence, and still more at the youth of the speaker, the traveller asked him what his age was. He had not completed his twentieth year, and had just received a sum of money and the rank of officer as a reward for his courage and fidelity.

This brave young man, after having voluntarily shared his master's misfortunes, and restored him to life and liberty, was now enjoying his happiness on his marriage-day, gazing at the feast through the window. But the stranger happening to express his astonishment that he should not be in the ball-room, and appearing also to imply some suspicion of ingratitude in his old master, Ivan glanced towards him a fierce and angry look, and walked into the house whistling the tune "Hai luli, hai luli!" He very soon appeared in the ball-room, and the inquisitive traveller jumped into his kibick, quite thankful not to have received the fatal axe over his skull.

SKETCHES IN NATURAL HISTORY.

THE CLOTHES' MOTH.

THE moth commonly found among clothes is the *Phalæna Tinea Pellionella* of naturalists. It is a creature of some interest, both on account of the peculiar features which mark its history, and the annoyance which it gives to man in an important point of his domestic economy. The Tinea Pellionella finds its food and habitation chiefly among woollen stuffs and animal furs, and haunts alike the coarsest and finest substances of that description. The ermined robes of kings and judges are held not one whit more sacred by it than the habiliments of the poor and humble. Its proper food is said to be hair, however; and when a skin covered with that material comes in its way, it shaves off the capillary covering as cleanly and cleverly as a razor could do. But it also feeds liberally on wool and furs, and as these substances form our common clothing, it is in connexion with them that the Tinea Pellionella comes chiefly under our eye. Another species of moth, likewise, the Tinea Sarcitella, feeds on wool, and commits great ravages among clothing of that material. Generally speaking, the following remarks will apply to it, as well as to the preceding species.

In its moth state, the Tinea Pellionella is of small size, and of a leaden colour. It is, like its congeners, originally produced from an egg, and is then perfectly naked—which circumstance overturns Paley's assertion that man is the only member of the animal world that is born naked. The further statement of the same writer, that the human animal can alone clothe itself, is likewise disproved by the history of this insect. As soon as the little creature quits the egg, being not, as man is, in a state of helplessness at that period, it begins to form a suit of clothes for itself. For this purpose, it spins, in the first place, a thin and very fine tissue of silk around its body, in the same manner as other insects spin their silk-cases. It then cuts the filaments of the wool or fur on which its egg had been deposited, dividing them close by the skin or thread of the cloth, by means of a pair of teeth with which it is provided for that end, and which act precisely like scissors. The same filaments are then cut by the insect into convenient lengths, and applied one by one, with the most surprising dexterity, to the outside of its silken case, to which it fastens them by the agency of the additional silk which it emits at will, applying always new layers in succession, and fastening them in the same manner, until it has thus brought the whole case to a convenient thickness. No product of human art could be more regularly woven than this vestment, the mechanical process being precisely the same in both instances. When completed, the case is in the shape of a hollow tube, of the length of the body of the insect, which makes its abode in the interior, nor ever quits it except in case of urgent necessity. When it wants to feed, it puts out its head and helps itself with its cutters; and when it is desirous to shift its position, it pushes out its six anterior limbs, having first fixed the posterior ones to the case, so as to drag it along when the fore legs move.

Being thus within a warm and compact tenement, lined with the most delicate silk, the insect feels as comfortable as may be, until its bulk, increasing with its age, renders some alteration of the original structure necessary. In fact, this necessity occurs several times successively. The consequent mutations of the case "are accomplished by the little occupant (to use the words of Kirby and Spence) as dexterously as by any tailor. If the case merely requires lengthening, the task is easy. All that is necessary, is to add a new ring of hair or wool and silk to each end. But to enlarge it in width is not so simple an affair. Yet it sets to work precisely as we should, slitting the case on the two opposite sides, and then adroitly inserting between them two pieces of the requisite size. It does not, however, cut open the case from one end to the other at once; the sides would separate too far asunder, and the insect be left naked. It therefore first cuts each side about half way down, and then, after having filled up the fissure, proceeds to cut the remaining half: so that, in fact, four enlargements are made, and four separate pieces inserted." These additional rings and longitudinal stripes are always lined with silk, and are as perfect in disposition as the original case. The additions are well marked, and may be observed under ordinary circumstances. But there is one way by which they may be made still more distinct to the view. The colour of the habit, or any part of the habit, always corresponds with the hue of the cloth from which the materials may be taken. Accordingly, the progress of the creature's various operations is made beautifully manifest, when it is transferred from cloth of one tint to a differently coloured article. Thus, if the original case has been formed from white cloth, and the insect be then placed upon a scarlet article, the first rings at the ends, which usually constitute the first enlargement, will be of scarlet. Let the creature then be shifted to a black cloth, and new rings of black will appear. The side stripes may in like manner be rendered blue or green, so that, upon the whole, the case will present a parti-coloured appearance, making the Tinea into a little harlequin.

In such a manner does the insect proceed, always enlarging its case with undeviating regularity in proportion to its growth, and consuming in the process a very considerable amount of the stuffs upon which it chances to be at the time. Another portion of the same material, whether wool, hair, or fur, is required for its food, and this portion, also, is no inconsiderable one. But besides the consumption occasioned by clothing and feeding, the creature is compelled to extend its ravages still farther. In moving from place to place, it seems to be as much incommoded by the long hairs surrounding it as we are when walking among long grass; and accordingly, it projects its scissors in front of the case, and mows down, as with a scythe, all that stands in its way. Its track is thus still more distinctly marked on the stuffs which it is placed upon. When it pauses in its course, a silken cable is thrown out and fixed, securing in this way a safe anchorage in case of any movements taking place in the main body of the substance to which it is attached.

When enclosed in this case, the creature is in what is called its larva state, and attains the length of about half an inch. The period then arrives, when, in consonance with the modes of its tribe, it prepares for its change into the pupa or *chrysalis* condition. This change is begun by abstinence from food, and the creature subsequently weaves around it a cocoon of silk, spun for the purpose. From this it issues forth, in the space of about three weeks, in the shape of a small nocturnal moth, of a leaden or silver-grey hue, and with a black point in the middle of each wing. This evolution takes place usually in the month of August, and the insect, now completely formed, exists afterwards but a week or two, during the whole of which time it appears to be incessantly engaged in searching for a fit place in which to lay the eggs which are to continue its race. Having fulfilled this end, its short career comes to a close. Out of the whole period of its life, which extends to about a year, ten months are spent in the larva or caterpillar condition.

The eggs of the clothes' moth are an alarming sight to the careful housewife, and they are brushed off and destroyed by her without compunction, whenever they

Digitized by Google

are seen. When one thinks of the extraordinary ingenuity which these creatures evince, and the beauty of the processes which they go through, one feels, as it were, a degree of regret at the annihilation of creatures which have been endowed by the Disposer of all things with powers and habits so surprising; but further consideration should satisfy us that a check must be put, and was intended to be put, on the spread of all these inferior creatures, if they interfere with the comfort of man. An unlimited spread of these moths would keep us half naked; and it would be as foolish to encourage or permit such a thing, as it would be to foster the breed of tigers on account of the uncommon beauty of their skins. Hence, notwithstanding the interest with which the natural history of the clothes' moth abounds, its removal from substances of use to man becomes quite legitimate. The ravages which the creature commits among furs and fine woollen goods, are indeed so great, that much ingenuity has been expended upon attempts to get rid of it. Unfortunately, the means by which this may be most easily effected, are attended with disagreeable effects to the cloth or other material so cleaned. Turpentine, or the flavour of it, when moderately strong, instantaneously kills the moth; but turpentine is highly unpleasant to the human senses, and, when cloth is once impregnated with it, there is no removing its odour. Where this is of lesser consequence, no more effective remedy can be used, and only one colour, rose-colour, is affected by the oil. If goods infested by the Tinea, be put into a close place, and a saucer of turpentine placed along with them, the fumes which rise from the oil, at a moderate temperature, will destroy the vermin, without the substance being actually touched or sprinkled with it. To touch the cloth with a hair brush dipped in the liquid, will bring the nuisance, however, to a speedier close. The best way of banishing the consequent smell, is to hang up the stuff for a time in the open air.

The smoke of tobacco, or a decoction of it, is also effective in removing these insects. The flavour of this substance is so disgustful to them that they are either killed by it, or avoid the tainted material. Here, again, however, the odour is one distasteful to the senses of a majority of the human race, particularly when it comes to them through the medium of clothes. The following plan is another of the many that have been proposed for the purpose under consideration. Some observers discovered the curious fact that the clothes' moth has a strong dislike to unwashed wool, probably from the animal oil or grease incorporated with it. Acting upon this discovery, many people have got rid of the insect by placing unwashed wool in layers among the infected cloth, or rubbing it upon the latter material, so as to communicate its flavour thereto. Another plan is also very generally followed. It had been observed that the moth was seldom if ever seen in drawers or boxes of cedar-wood, and it struck some one that to place cedar shavings in drawers made of other woods might answer the same purpose. We believe that this very simple scheme has proved pretty effective upon trial. The cedar has rather a pleasant flavour than otherwise. Many other strong-smelling substances, and in particular camphor, have been used for the same purpose with more or less success; but into the history of all these expedients it is needless to enter here. We must observe, however, before concluding, that, for the banishing of moths from ordinary household wardrobes, frequent airing of the contents is perhaps the best of all plans that can be tried. The clothes' moth, or its larva, delights in close, secluded, smothering situations, and cannot abide the open air. When the clothes are taken out, they must be well shaken, as the silken cables already alluded to, by means of which the creature anchors its case, hold it very firmly attached in ordinary instances. In September, when the larva is young, the attachment is less secure, and therefore that month is the best for airing and shaking clothes. They will be cleared of the vermin completely for the whole ensuing season, if the operation be then efficiently performed. September is the best season, likewise, for smoking these insects, as they are more easily killed, of course, when young.

We have now but one other point of interest to notice relatively to this curious little creature, which forms, as we have seen, so striking an analogy to the human being in two important particulars, petty and insignificant as it may appear. We allude to its nakedness at birth, and to its tailoring powers. The remaining point of interest in its history has reference to the excrementitious matters which it emits. We quote Dr Anderson's Recreations in Natural History upon this subject. The excrementitious matter of the larva is tinged red, blue, green, or white, just as the colour of its food may be, and from this peculiarity Dr Anderson is led to suggest, "that this insect might be usefully employed by man in the preparation of *pigments*. It is probable that the colours thus obtained might possess qualities that belong to none others, so that it is a proper object for experiment." To a certain extent, Dr Anderson goes on to tell us, experiments had been already made, and from these it was found that the matters in question possessed an extraordinary fineness of tint and comminution, and that "they mixed equally well with water and oil. Thus, therefore, might be obtained greens and blues of the most beautiful tints in a state of perfection, and also one colour which has long been a desideratum, namely, a fine opaque white for water-colours." The doctor then proceeds to say, that, if ladies must have artificial complexions, how much superior would be such paints to the deleterious cosmetics in common use; and as hairs form in part the food of the insect, he ingeniously remarks, that "the pearly hairs of a grandmother might be the means of augmenting the beauty and saving the life of a grandchild, by affording a pearl white of a delicacy of tint and harmlessness of character that cannot be equalled by any chemical preparation."

These suggestions were made more than forty years ago, and we are not aware if they have been ever adopted for any practical purpose. They seem somewhat fanciful, certainly; but when we remember that the cochineal insect affords one of our most common dyes, we cannot but think that Dr Anderson's suggestions might have some practical value. He points out that shearings of cloth, an article usually treated as refuse, and various kinds of wool and hair, might be dyed and used as food for the Tinea Pellionella and its immediate congeners, such as the Tinea Vestianella, or clothes' moth of summer, the Tinea Tapetzella, or tapestry moth, and the Tinea Mellonella, or moth that attacks bee-hives. We repeat that we are not aware whether the plan has been tried or not since it was suggested, but it is worth an experiment. Let not any one smile at it, on account of the necessary minuteness of the proceeds of such an experiment, when tried at least on a small scale. How vast are the quantities of silk used in the world! Yet is it a petty grub just such as is the Tinea Pellionella, that supplies all that enormous amount of silk. Attention and care have produced these great results in the one case, and similar means might have similar effects also in the other.

THE POLICE AGENT.

BY ARMAND DURANTIN.

[Abridged from "Pictures of the French, drawn by themselves," now in course of publication.]

THERE exists a class of men whose name is well known to the public, but whose manners, habits, and diplomatic address, almost defy observation—a remarkable type in French society, but a type varied to infinity: we mean the POLICE AGENT.

We have observed that every one is acquainted with his name, but very few have studied his position. We do not speak of the *garde municipal*, who belongs to a regular body of troops; nor the policeman, the zealous protector of public peace and morals, who would not scruple to take Fanny Elsler herself into custody if she were ever to venture to dance the cachucha under the shade of the Chaumière, or in the Tivoli gardens. But there exists a peculiar class of agents who eschew scrutiny, and are almost impenetrable to the common observer—in short, the *secret* agents, whose mysterious proceedings we have been watching in order to bring them to light in this gallery.

In truth, the notions generally entertained of the organisation of the police, are singular enough. Many worthy citizens firmly believe that there is no street, passage, public walk, or assembly, that is not crowded with secret police agents, and thieves no less numerous. With respect to thieves, we do not say nay; but, certainly, the number of agents is limited enough: only they know how to multiply themselves with so much address, that one alone would, in a case of great urgency, be enough to watch over Paris.

Thirty-two agents alone have the surveillance of the French metropolis, and the care of the safety of its inhabitants. They are mostly chosen from among those unfortunates who, having no other employment or resources, are compelled to accept a wretched situation, of which most of them are ashamed. Doubtless, this is an amelioration of the moral condition of the police, but it is perhaps an evil; for those men who are unskilled in the trade, who are unacquainted with the tricks of the thief's profession, who cannot associate with robbers, are more likely to let delinquents escape than their predecessors, who had daily intercourse with bad characters, followed them in their nocturnal depredations, and to their secret haunts, and watched and denounced them in time to prevent the perpetration of intended crimes. The police have indeed appreciated the inefficiency of the agents, and are occasionally obliged to employ men of a different stamp, who are not strictly in their pay, but who perform the same duties as the ancient companions of Vidocq. This class of spies, composed of known thieves, and men who have already been convicted, establish an intercourse with the police agents, and although they do not entirely renounce their unlawful practices, clandestinely give information that often leads to the discovery of crime. Their number is unlimited; they generally meet at wine shops, taking care to place a scout at the door to keep watch.

The secret police agents begin their operations in Paris early in the day. Some are charged with the inspection of pickpockets, others with the apprehension of shoplifters. For this service the agent disguises himself as a workman, dandy, or what not. The features of this class of thieves are known to him, and not a day passes that he does not detect one or more in the very act, in spite of their artful evasions. Others have in their province to proceed under the superintendence of their chief, M. Allard, to effect the dangerous arrest of housebreakers and murderers. When a man is suspected of having committed murder on the highway, the chief of the brigade of safety gives instructions to the sixteen inspectors of lodging-houses in Paris, and these make inquiries about the haunts of the accused parties. The steps of the latter are dogged, every attempt is made to discover where they passed the night of the crime; and if circumstances corroborate the suspicion, they are immediately taken into custody, and placed in confinement.

The agents receive eight francs per arrest; but out of these eight francs they have to pay *their* informants. Moreover, the higher officials levy a mulct upon the paltry remainder, so that the agent pockets a few sous only of his premium. Yet it is well known that the duties of the police are efficiently discharged; and though it is impossible to prevent every crime, few are left unpunished.

The Police Agent is not very conversant with the usages of good society, nor is he there treated with respect by his superiors, as the following anecdote will testify. The head of a department entertained several important personages; the invitations included a secret agent, from whom information was required. Uneasy in such good company, the agent was unable to conceal his embarrassment. He was particularly puzzled by the sight of the little silver spoon on each salt-celler, and could not divine the use of an instrument apparently so superfluous.* Wishing to help himself to some salt, our humble guest removed the salt-spoon, and coolly plunged his finger and thumb into the salt-celler; he then carefully replaced the mysterious instrument. The master of the house observing a sneer on the countenances of his guests, turned to the secret agent, and complimented him on his renowned skill in capturing thieves. Gratified by this notice, the agent related some of his feats, and asserted that no thief could escape him.

"Are you so ready at tracking?" asked the functionary.

"As a poacher after game," answered the agent.

"Then can you tell me," pointing to the salt-celler, "what animal has passed there?"

Yet the Police Agent has a good deal of learning. He knows all languages, and, according to circumstances, he could arrest you in French, English, Italian, or German, and would make himself understood in Chinese, if he had to capture a mandarin. He is a very chameleon for changing at will, colour, tone, and manners. The world is his native country; he has neither friends nor relatives, and would, if need were, arrest himself. Seven towns assert that Homer was born within their walls; an equal number would rise to disown the Police Agent, if there were the slightest suspicion of one of them being his birth-place. He is of any age, or of none; he has names without number, and is never known twice by the same. To-day he has riches, honours, a title and the ribbon of an order; to-morrow he will wear a blouse, and smoke a clay pipe. He knows every thing, sees every thing, and is every where at once. With one ear he listens to the instructions of his principal in the Rue de Jerusalem, while with the other he overhears the conference of certain conspirators in a garret in some obscure faubourg. In the first days of the Republic he frequented the clubs with his chin immersed in the folds of a large red scarf; when France was ruled by the Directory, he played deep in the saloons of the Faubourg St Germain. Then came the Empire, and he acted as spy alike upon the royalists and republicans. Governments changed; but not the agent. The suspected party of one day was in power the next; and the agent many a time received his orders from those who a few days before were under his surveillance. After the Restoration, decorated with orders and noble titles *ad lib.*, he acted as a spy towards the Bonapartists, who could no longer reward his services. At a later period, after the revolution of 1830, he insinuated himself into secret societies, composed of the most inveterate enemies of the government, and gave the first signal of the *emeutes*. We saw one called as a witness before the court of assize, impudently reply to the judge, who was ignorant of his position, and boldly provoke an uproar, knowing that he would be supported. This agent was a more violent *bonnet rouge* than the wretches whom he had denounced.

There are dandies of the profession, charged with important operations, and certain captures that require more intelligence and cunning than force and courage. Not a day passes that you do not elbow one of them in the street; and often at the theatre, your amiable and obliging neighbour, who converses with such good taste on all the trifling topics of the day, is no other than an agent of the Rue de Jerusalem come to feel political pulses, or watch the proceedings of a notorious member of the swell mob.

The Police Agent has a wonderful faculty for every metamorphosis. The man who a few minutes ago appeared so rough and ill bred, can in a twinkling assume the most elegant manners. This reminds me of a curious scene at which I was present a few summers ago in a hotel at Cauterêts, when I myself was completely duped by a Police Agent.

I dined that day at the *table d'hôte*, and by my side sat a charming young Parisian lady. A stout old gentleman was tying a napkin round his little boy's neck, while his wife endeavoured to cut something eatable off the lean skeleton of duck sent her by the young man at the head of the table. My attention was naturally attracted by the carver, who at a *table*

d'hôte is too important a personage to be neglected. I observed him closely.

He was rather a good-looking young man of about five and twenty; his black hair was artistically curled; he wore a small moustache, and his countenance had a very pleasing expression.

The next day, I learned that the fair traveller had been to visit the waters of Cauterêts, and that not daring to venture alone, she had accepted the young dandy's arm.

For some time they walked on in silence beneath the avenue of elms, and were bending their steps towards a neighbouring village, when a post-chaise that was rapidly passing them stopped on a signal from the young man.

"What are you going to do?" asked the fair traveller.

"Surprise you agreeably," answered the young man, laughing. "Step in, walking is weary work, and for me this journey will be most delightful."

"Sir, you are too gallant."

"No one can be gallant enough for so fair a lady," returned her companion, carrying her unresisting hand to his lips.

"Come," said she, laughing, "I abandon myself to your care. What should I have done," she added, in a tender voice, "if I had not met you? I must have died of ennui! You are certainly my good genius."

The young man smiled, and made no answer. Meanwhile, the post-chaise drove rapidly onwards; and an animated conversation soon ensued between the travellers.

"Where are we going?" exclaimed the young lady. "This is surely the high road. Postilion! postilion!"

The young man did not reply; he no longer even smiled.

"Sir, this conduct is infamous," cried the young lady, in a voice of terror. "Where are we going? Whither are you carrying me?" "To Paris."

"What do I hear?"

"That, so far from being your good genius, I am, on the contrary, commissioned to conduct you, first to the Rue de Jerusalem, and thence to prison."

"There must be some mistake, sir."

"Oh dear no, not at all—I never make mistakes. You are Emma Popply. What! don't you remember Rigody?" So saying, the handsome young fellow slowly took off his jet black wig, which concealed a short crop of bright vermillion; removed the false beard and moustache that graced his bald chin and lip; and having carefully bestowed them in his great-coat pocket, he coolly proceeded to fill and light a common red clay tobacco-pipe, humming snatches of Brandhofen all the while.

The chaise still drove at great speed, to the great dismay of one of its occupants. Having exhausted tears and threats, she had recourse to cajoleries, and these failing, tried an hysterical fit. But all were alike unsuccessful; nothing could disturb the equanimity of the agent, who, with the utmost unconcern, watched the volumes of smoke ascend to the roof of the chaise.

"Sir, your conduct is cowardly and beneath contempt, thus to inveigle a poor defenceless woman!" said Emma, almost bursting with rage.

"You are a charming companion," said the agent, removing his pipe, and kissing her hand with mock respect.

"This insolence is not to be borne," said the irritated fair one, smartly boxing her tormentor's ears.

"You were more amiable a few minutes ago," answered Rigody, still unmoved.

"Let me go," said she, after a few minutes' hesitation, "and I promise you two-thirds of all I possess, jewels, gold, and notes."

"No—the thing's impossible."

"Suppose I consent to be yours?"

"You have just made me a better offer," said the young man.

"Brute," cried the mortified lady, relapsing into a silence that was unbroken till, three days afterwards, the post-chaise stopped before the hotel in the Rue de Jerusalem. The entrapped lady was handed out by her fellow traveller, and taken charge of by two policemen, who immediately closed the iron gates behind her.

I returned to Paris, and had entirely forgotten the two travellers, when one evening, about two months afterwards, whom should I meet at a party but my handsome hero of the glossy black hair, beard, and moustache. Having returned his bow, I inquired how matters stood between him and his conquest.

"Which?" asked he. "Ah! I remember. A young girl, rather pretty?"

"The same. You carried her off, lucky fellow that you are!"

"Carried off! No, indeed; I only took her to the prefecture of police. If you consult the register, you will find this entry:—'June 3, 1832.—Emma Popply, aged twenty-two, accused of purloining diamonds and cashmeres. Placed in confinement at five o'clock this day.'"

"Why, who are you?" said I, in astonishment.

While I spoke, an old gentleman stopped near me, and stared hard at the young dandy, who, instead of answering me, changed colour, and, turning on his heel, disappeared in the crowd.

"Sir, can you tell me who that young man is?" said I, turning towards the old gentleman, with whom I was slightly acquainted.

"A secret agent of police," was the answer. "Some months ago I was his dupe in a political affair, in which he played the part of accomplice to act as spy against us. Every time he sees me, he instantly retreats. Whenever you chance to meet the fellow, do not fear to unmask him openly, sir, as I have just done to you."

THE PERSECUTION OF THE JEWS AT DAMASCUS.

THAT species of persecution to which the Jewish people were exposed in England, and other European countries, during the middle ages, has lately been revived with barbarous atrocity at Damascus, under the government of Mehemet Ali. The people of this country have been made acquainted with the details of this odious transaction from the report of Mr Merlato, the Austrian consul at Damascus, addressed to M. Laurin, Consul-General for Austria at Alexandria, dated March 23, 1840, and which has been circulated in a translated form in the English and French papers. From the succinct account of Mr Merlato, it will be observed that the pretexts for the injuries committed on the unhappy Jews, are very nearly the same as those which have been always used in similar cases—an unfounded charge of murdering adult or infant Christians, for the sake of employing their blood in certain religious offices. The following is Mr Merlato's report:—

"On the 5th of February 1840, a Capuchin friar of the name of Father Thomas, a native of Sardinia, disappeared suddenly from Damascus, where he had resided since the year 1806 or 1807; and at the same time a young man, his servant, was likewise missing. Father Thomas had formerly practised medicine, and for a considerable time past had devoted himself exclusively to the vaccination of children of all classes and all religions; he was well known throughout the country. He had amassed a much larger fortune than is consistent with the regulations of the monastic order to which he belonged. He was not fond of giving; he talked a great deal, and to all kinds of persons, without exception; he was rather given to intemperate habits; he was of an easy temper, and had but little education.

The day after his disappearance, the French consul (M. le Comte de Pratti Menton), whose duty it was to investigate the affair, commenced the task of tracing the fate of the two unfortunate men. He repaired first to the chamber occupied by them; money, the friar's effects, those of the servant of the hospice—all was found untouched. At the same time several Israelites declared that the Friar Thomas had been seen in the quarter of the Jews towards evening, on the day on which he was missed. No one said that he had been seen to quit it, no one testified to his having been seen elsewhere. It was inferred from these circumstances, that, on his entrance into their quarters, he had been murdered by the Hebrews. As soon as this idea was conceived, the search was no longer directed towards any other part of the town; yet it surely would not have been improper to carry the investigations beyond the quarter of the Jews, more especially as Father Thomas and his servant had, a short time previously, had a violent quarrel, accompanied with blows, in the square of Hassan Pacha (a part of the city much frequented), and as this fray had arisen between them and some Mussulmans of the lowest class, such as porters, carters, &c. Nevertheless, a young Hebrew, who thought proper to declare that he had seen him elsewhere, was so severely beaten with rods, that he expired after twenty-four hours' imprisonment.

Arrests followed: the bastinado was liberally used among the sufferers; one Hebrew, a man sixty years old, expired under the strokes; his crime was that of being doorkeeper of the Jewish quarter. The bodies of two Israelites lately dead were disinterred, to see if they were those of the two men who were missing, or at least those of two Jews who, having assisted in the perpetration of the crime, might have received some fatal wound in the struggle in which Father Thomas and his servant had perished. Many houses were searched, among which were some belonging to Austrian and Tuscan subjects, or persons protected by Austria, under the authority of my consulate; but for many days all these investigations were completely fruitless.

At length the French consul demanded the release from prison of a Turk of low extraction, named Mohammed Telli, who had been confined for debt towards the state, and employed him in the affair, not only to trace the guilty persons, but likewise to exhort suspected persons and prisoners to furnish, by their confessions, some clue, some indications, for the discovery of the crime and its authors.

Among the first persons arrested was a Jewish barber; he had been interrogated at the French consulate, and in his answers were found some confusion and some contradictions; he was thought to be more seriously inculpated than the other prisoners. He was kept at the consulate for three days, was exhorted to declare every thing, and was promised a reward, and a safe conduct to foreign countries—but all these means were ineffectual; he persisted in his denials; nothing could shake him. He was remanded to his excellency the Sherif Pacha. The promises were renewed without success. Then he was cruelly beaten with rods two several times, and they applied the torture to his head. In the interval he received a brotherly visit from Mohammed el Telli, so that he ended by declaring as follows:—He said, 'That on Wednesday, February 5, towards evening, he had been called into the house of David Arari, where were also Joseph, Aaron, and Isaac Arari, Moussa Aboulaffia, Moses Salonati, and Joseph Lanisado, all distinguished merchants among the Israelites. They desired him to murder Father Thomas, who already lay bound in a corner of the room, but he refused to execute a crime so horrible. Then they dismissed him, putting into his hand a sum of money to induce him to keep silence respecting what he had seen. He retired, without knowing the fate of Father Thomas.' The seven merchants were instantly arrested and interrogated. They denied every thing. They were ordered to be bastinadoed; but it being remembered that as most of them were of an advanced age, they might very likely die under the first strokes, it was thought that confession might be extracted by another species of torture. They were consequently made to remain standing for thirty-six hours consecutively, without being allowed to sleep. They underwent this torture, but persisted in denying all. After this trial they were beaten with rods, but this proceeding was soon suspended, for at the twentieth stroke the sufferers fainted away. As they persisted in their denial, the French consul judged that the punishment inflicted on them had not been executed according to the letter, and demanded that it should be repeated. This request was acceded to, but they continued to declare themselves innocent.

In the meanwhile, the servant of David Arari was seized on. He was made to submit for a long time to the torture of the rod. In the intervals they washed his lacerated body with cold water; at last he said, that, by order of his master, David Arari, he had called on the barber to bid him come towards evening to the house. They searched the house of David Arari as many as six times, in hopes of discovering something; but fruitlessly. At length, on the evening of the 27th of February, 1840, the servant, whose name was Murad el Fallat, was called; after a formal promise of impunity, a promise made to him by the French consul, after more than one of Mohammed el Telli's affectionate visits, he declared 'That it was he himself who had murdered Father Thomas, in the house of David Arari, his master, in the presence and by the order of the seven merchants under arrest; the blood of the poor friar had been received in a crystal vase, for religious purposes to him unknown. The barber and himself were then employed to cut the body in pieces, to bray in a mortar the bones and the skull, and carry the whole away to an aqueduct which flows through one of the streets inhabited by the Hebrews, at a distance from the dwelling of Arari.' They now returned to the barber, interrogated him gently, in an insinuating manner. They encouraged him by fresh promises of impunity: he declared at last the same as the servant had declared. The French consul and his followers went to the place that had been indicated, preceded by the two witnesses one after the other. These two persons were mounted on carts, their sufferings not permitting them to stand or walk. At the spot pointed out by them, the drain was opened, and some bones were found, together with the remains of a cap. Some physicians declared that they were human bones. These were taken to the seraglio, and shown to the seven accused men, who, nevertheless, persisted in repelling every accusation of guilt. They were then made to suffer tortures of various kinds, and given up to the rods, and, one after the other, they all at last confessed themselves guilty of what the barber and servant had declared.

Four days after the confession of the seven merchants, an attempt was made to compel them to give up the watch and keys of Father Thomas. The unhappy men, perceiving that the sole aim was to prolong their miserable existence in the midst of the most dreadful tortures, denied every thing, and declared that their late confessions had been extorted from them by the violence of their agonies. This caused much surprise to the inquisitors, who had again recourse to the bastinado and other tortures, to bring them back to their former confessions, but all in vain."

The consul then states that similar accusations had been made, with respect to the servant of Father Thomas, against other Israelites, among whom was Picciotto, an Austrian subject; that Picciotto had proved a distinct *alibi* by the evidence of Mr Marson, an individual under the protection of England; that the bones stated to have been found were afterwards declared by an able physician to be those of animals; and he then proceeds as follows:—

"I, as consul, could not allow that an unfortunate Austrian, whose reputation as an honest man and peaceable merchant had hitherto remained unblemished, should be given up to the malice of his enemies. I have therefore thought that a circumstantial account of the proceedings should be forwarded to your imperial consulate-general in Egypt, in order that such measures may be adopted as you shall judge proper for preventing, not only a subject of our empire, but even any European, whoever he may be, from finding himself, as is here the case, at the mercy and discretion of this infamous judicial inquisition. I venture to hope that you will appreciate the reserve and caution of our conduct in this deplorable business, when

Digitized by Google

you read the correspondence which has taken place. Our opponents had it in their power to lay hold of a formidable weapon against us, namely, the blind and ignorant fanaticism of the Christians in this country. Because I, as Austrian consul, did not warmly lend myself to the encouragement of measures dictated by stupid passions, they have dared to address to me the most opprobrious imputations, and have probably ascribed to me the most foul and immoral intentions. I therefore most respectfully implore your excellency to interfere actively and efficaciously towards preventing, for the future, the recurrence of these calumnies, and obtaining honourable reparation for the injured individuals. If the Egyptian government will conscientiously endeavour to obtain accurate information on this strange event, it has only to summon all the accused, in order that they may be submitted to another examination, rigorous, but more in accordance with the customs of civilised nations. Otherwise my opinion is, that the truth with respect to this affair will always remain involved in obscurity."

In another statement of the same consul, the following passages occur :—

"The Israelites of this town have undergone persecution, against which any other class would have risen in revolt. The names held in the highest estimation among the Jews, those whose fortunes are derived from the purest sources, those whose weakness is most deserving of compassion, are equally insulted and insecure. Sixty-three children have been detained in prison several days ; women have been called upon to appear, and have been interrogated. At the first suspicion, the most respectable Jews, if not previously arrested, took flight ; others secreted themselves in their houses, in order to escape the insults of the Christians."

The irritated Christians assembled in the public squares, relate to one another the most unheard-of extravagances about this sect, which they hate. The consul has made public an Arabic translation of some execrable doctrines imputed to the Jews, and drawn from a Latin book, entitled *Prompta Bibliotheca*. This book has been furnished through the zeal of our Christian missionaries of the Holy Land. A copy of it has been forwarded to his excellency Ibrahim Pacha.

Finally, Mr Merlato, in a third statement, says—"An agent of the government yesterday discovered the retreat of Moses Fahi, son of Meir. He was brought before the pacha ; they asked him where his father was. He answered that he did not know ; instantly he received the bastinado. The child, being of a weak and delicate constitution, implored them to send for his mother. She was brought, but revealed nothing. The young man was again scourged with rods, and the unhappy mother in despair disclosed the place where her husband had taken refuge. I declare to you, sir, that it is impossible to endure any longer the spectacle of such atrocities, in which, underhand, the Latin monks and some Christian monks of the country take an active part, backed by the blind fanaticism of a mob who think their bigotry Christianity. A system of espionage is publicly organised, and encouraged by promises of money. All hearts are void of compassion ; each dreads for himself the miseries of which he is witness. I shall claim, in the most urgent manner, the interference of the superior authorities."

M. Laurin, Consul-General at Alexandria, thus expresses himself in a letter :—"The accusation has no legal foundation ; the avowals of guilt have been obtained either by the agony of the torture, by intimidation, or by deceit.

For the interest of humanity, as well as especially for that of our subjects who are in danger of being put to death, though innocent, I am making every possible exertion to obtain from Mehemet Ali an order to direct that proceedings may be carried on in a humane manner, and judgment pronounced by judges who may be enlightened, independent, and free from prejudice. Mr Merlato deserves all praise, and every assistance in his courageous efforts on behalf of the innocent."

In consequence of the representations made to him, Mehemet Ali interfered to stop the persecution at Damascus, though it is yet uncertain whether he will make a full and proper investigation into the subject, or issue such commands as will prevent a recurrence of the illegal barbarities. From a passage in the petition of the Egyptian Jews to Mehemet Ali, praying for his interference, it is evident that the persecution was greatly promoted by a certain resident European. After adverting to the revolting and incredible charge that the Jews would sacrifice a man and drink his blood, the petitioners say—"This is false on the face of it, but the old enmity of a person too powerful in Syria against every individual of our faith, gives credit to such a falsehood, and hence the most respectable people of the country are tortured ; blows without number are inflicted on their persons ; newly invented and most severe tortures afflict the unhappy race, and these are the means to induce them to confess! Surely such great suffering might extort a false confession from some of them, for, though there are many men who can face immediate death, there are but few who can endure torture, and in Damascus the tortures are greater than they have ever been in the world. Already have Israelites been known to confess themselves guilty, and afterwards their innocence hath been proved. Above one hundred children are perishing in prison from want of food. And this is the way in which justice is administered to your people in Damascus." The individual here alluded to, and whom the Jews in Egypt dare not venture to name, is Count Pratti Menton, consul of France—a fact which, if true, certainly calls for some decided measure on the part of his government. We are glad to learn that the British government has already exerted itself in behalf of the much injured and perilously situated Jews of Damascus, and from this circumstance alone we may anticipate a speedy conclusion to these barbarities.

A FEW WEEKS FROM HOME.

NEWCASTLE—CONCLUDED.

THE improvements which I have described as having taken place in Newcastle, were accomplished in the space of five years, or between 1834 and 1839, and added new property to the town which has been valued at nearly a million of pounds. Much of this property, however, remains unfinished or unoccupied ; a great number of the shops have never been opened for business, and are not likely to be required for several years ; many houses, likewise, remain without inhabitants. It is rather unfortunate, that, by Mr Grainger's arrangements, there is little choice in the new erections. There is a complaint of a want of variety. A shop is but one apartment, notched out of the front of a building, leaving the house otherwise from cellar to garret to form a private dwelling, entered by a separate door. This kind of house has many inconveniences ; it will not be selected by a superior order of inhabitants, who will prefer a house at a distance from the business streets, and it is too large and expensive for persons of moderate desires and means. The common-stair plan of building, as at Paris and Edinburgh, might have been introduced into some of the business districts with considerable advantage both to proprietor and tenant. In the present partially occupied state in which we find both new houses and shops, an annual rental, as it appears, of L.17,416 is realised ; when fully occupied, the sum will be increased to L.40,000.

The whole of Mr Grainger's surprising alterations were begun and carried on towards completion without an act of parliament—a circumstance only to be accounted for by the general popularity of his schemes and his own energy of character. He was likewise greatly favoured by having to negotiate with a town-council which had been lately remodelled, and was desirous of carrying useful improvements into effect. So far was the civic corporation impressed with the propriety of making extensive improvements, that it procured an act of parliament in 1827, by which, along with powers respecting matters of police and local management, it possesses authority to remove certain old streets and buildings in divers quarters, so as to open up new lines of thoroughfare from the environs. This design, and also a plan for extending the quay for shipping and steam-boats, are now slowly in progress under the care of the council, whose funds are able to permit to a certain limit this species of outlay, as they amount annually to about L.40,000. Of the ultimate benefit of all these schemes of improvement, there cannot be any doubt. Newcastle had greatly fallen behind the taste of the age : it was not even worthy of itself. It is now, in point of elegance and comfort, on a par with, or rather superior to, most towns of the same resources.

At the period of my stay, the town was enjoying the treat of a polytechnic exhibition, which I took the opportunity of visiting, and found to be got up in a highly praiseworthy manner. The exhibition occupied a series of large apartments, in two separate buildings, which were connected by a temporary covered gallery thrown across a narrow street. Here we found upwards of 300 paintings and drawings, a variety of pieces of sculpture and models, a very large quantity of objects of vertu and curiosity, such as occupy public museums, an equally large quantity of articles illustrative of the progress in the arts, and many objects in natural history. High walls covered with rare and costly articles, long rows of glass-cases sparkling with gems and valuable objects of art, tables loaded with a profusion of vases, jars, &c., formed some of the details of the scene. But the principal place of attraction was the largest of the apartments, which usually serves as a music-hall. This room, measuring 100 feet in length by 40 in breadth, had its centre occupied by a circular basin of water, surrounded by a table on which was a railway with a small locomotive vehicle and carriage running round it ; it contained also a canal, on which was a model steam-boat in motion. Arranged around the margin of the circular table, there were various working models of apparatus demonstrating hydraulic operations. Near these interesting objects were exhibited five large annular polysonal lenses, with mirrors mounted in framework, as now used in lighthouses of the first order, with revolving and flashing lights ; the whole lighted up every evening. In another corner of the room a Jacquard loom was kept in constant operation, weaving figured waistcoating. In the middle of the floor stood a highly-finished steam-engine of five horse-power and somewhat novel arrangement, made for the exhibition by the Messrs Hawthorn of Newcastle. The cylinder of the engine, which rested on the floor, was singularly shallow, but of large diameter, and it and all other parts of the mechanism were of finely-polished iron : so smoothly and noiselessly did the engine work, that it was not heard over the hum of voices in the apartment. By means of shafts and belts, it turned a variety of apparatus requiring power to keep them in motion. By far the most interesting of these pieces of machinery that came under my observation, was Walton's patent card-making machine, which is probably the most wonderful apparatus ever contrived by human ingenuity. The object of the machine is to cut small pieces from a coil of fine steel wire, bend the pieces into a particular shape, and insert them as rows of teeth in a flat leather belt ; the ultimate design being to employ the toothed belt in the carding of cotton or wool. The making and insertion of teeth by the hand is a laborious and tedious operation, and therefore the invention of this machine is one of the finest triumphs of skill. The apparatus, which seems a perfect cluster of small wheels, levers, and other minute parts, acting by short and rapid jerks, performs nineteen distinct motions in the making of every teeth, and makes and fixes 250 teeth per minute. It was under the watchful care of a superintendent, who at times shifted the belt ; it had been brought from Lancashire to be exhibited, at a considerable expense to the directors. The exhibition, I am glad to say, was warmly supported by the inhabitants, not only of Newcastle, but of all the adjoining district ; and by a liberal arrangement of the directors of the railway, persons were brought from Carlisle to see the exhibition and carried back at a reduced fare. Up till the period of my visit, 7339 season tickets, and 21,919 single admission tickets (the latter 6d. each) had been disposed of—a fact of the most gratifying kind, as showing the extent of the interest now taken in rational and improving exhibitions.

Newcastle has long possessed one of the best mechanics' institutions in the kingdom, and has now an institution or society for providing popular lectures and music, on Saturday evenings, at a cheap rate of admission. I went to one of these Saturday evening assemblies, which took place in a spacious lecture-room beneath one of the halls of the polytechnic exhibition. The admission money was 2d., and I found present about 700 persons, chiefly workmen, and some young men from shops and warehouses. By some accident, the lecturer did not make his appearance, and the entertainment was necessarily confined to music. Some pieces were well performed on the piano, and sung by different individuals of both sexes, employed for the purpose ; but other parts of the performance were less to be admired. It is a pity that this entertainment should be defective in point of management, for such meetings, when well conducted, as they are at Glasgow, do much good, being both a cheap and an innocent substitute for the seductions of the public-house.

Besides these institutions of a humble character in Newcastle, there are others of a higher grade, for purposes of social advancement, and the cultivation of science and the arts. Latterly, a most extensive suite of public baths has been erected by subscription, and is now in full operation. I have seen nothing of the kind any where to compare with these baths. A substantial stone building of one story, covering an area of 176 feet by 134, is laid out with large and small baths on a remarkably liberal scale. There are, in a central open part, two plunge baths, one for gentlemen 100 feet by 50, the other for the working classes 96 feet by 30. Leading from the various corridors around these, are warm, medicated, tepid, vapour, and hot air baths, each in a small apartment, with a dressing-room adjoining : one section is laid off for ladies, and another for gentlemen, with separate entrances, and waiting rooms. All the baths are lined with glistening white tiles, and look clean and comfortable.

It is evident from these and other matters which fell under my notice, that Newcastle possesses a population who are desirous of being something more than mere money-makers ; no other town of its size is so ready a patron of the fine arts, or spends so much of its gains annually on literature. London booksellers tell us that no town in England, the metropolis excepted, has such a large demand for embellished and costly productions of the press. The general habits and language of the lower classes of the inhabitants afford some less gratifying traits ; still, it is pleasing to reflect that here, at least, is a horde of industrious human beings, who are not exposed every now and then to a complete failure of the means of subsistence, in consequence of those stoppages of employment which elsewhere occur almost at fixed times, and produce such wide-spread misery. Newcastle and its neighbourhood, embracing a population of 150,000, have little or no experience of these dreadful disasters. The people—all who are able and willing to work—are well employed, and at generally good wages. The manufacture of steam-engines and locomotive machines, which has lately been added to the course of industry, is now carried on to a very large extent, and employs some thousands of workmen. I had the good fortune to be permitted to walk through the establishment of Messrs Hawthorn, where five hundred men are constantly engaged in making these engines and machines, and was astonished at the magnitude and complex details of the concern. Upwards of a dozen locomotives—each valued, I understand, at about L.1500—were pointed out to me as preparing for the North of England and other railways. Nothing more is wanted to prove that the world is in no likelihood of standing still, than a visit to such an establishment.

In order to have some notion of the trade upon

Digitized by Google

the Tyne, I devoted a day to a sail in a steamer down the river to its estuary, a distance of ten miles. There is nothing in the voyage which can afford pleasure to the eye of a scene-hunter; all that craves attention belongs to coal-mining or manufacturing, and indicates the character of the district. From Newcastle, pretty nearly all the way downwards on both sides, the banks rise rather steeply from the edge of the water, being in some places composed of huge mounds of clay or muddy material, brought as ballast in vessels from London and other places to which coal is exported. These mud hills, the accumulation of centuries, in some parts cover a large space of ground, and rise to a height of perhaps 150 feet. In time, they become covered with herbage, and are not distinguishable from the steep banks which adjoin them. Placed at favourable spots on both sides, are numerous dingy smoking factories of glass, pottery, paints, and chemical materials. At intervals, we observe depôts of grinding stones, with wharfs for their shipment; and at many bold parts of the banks are seen staiths for putting on board coals from the pits, which lie at the distance of from a quarter of a mile to eight miles from the river. For this immense coal-field, the Tyne has for ages served as the great and commodious outlet. It has been the practice for many years to convey the coal from the mouth of the pit by a railway leading to the bank of the river, where it has been taken on board of lighters, called keels, to be carried down to the ships at Shields, or on board the vessels themselves, if able to come alongside. By improvements in the navigation of the Tyne, and the erection of staiths, the clumsy mode of employing keel boats has been greatly obviated. A staith is a very peculiar apparatus. It is a species of high scaffolding of wood, forming the terminating point of a railway from the pit, and to its brink is brought the loaded waggon ready to be emptied into the vessel beneath. As soon as the waggon reaches the verge of the scaffold, it is seen to sink slowly without suffering any disturbance, and is thus let down till close over the ship's hold, when the bottom is disengaged, and the entire contents are deposited in their designed situation. The waggon, being now emptied, rises in the air to the level of the scaffold, and immediately runs away along the line to make way for its successor. The mechanism by which this feat of falling and rising is performed is a powerful lever process, whose exterior large arms are alone seen in action. By these means a vessel can receive its load in a very short space of time, and the coal is likewise preserved from being dashed and broken, as would necessarily be the case if it were poured into keels, and from them shovelled into the holds of ships in the river. Keels are now used chiefly for conveying coal from the staiths above the bridge at Newcastle. The keelmen, who have latterly declined in number, are an exceedingly active body of watermen. Three men and a boy, the usual amount of a crew, will guide one of their little vessels down the river to Shields, a distance of twelve or fourteen miles, there deliver their cargo of eight chalders, or twenty-two tons, and return by the tide to the place whence they set out, all within a space of fourteen hours. It has been established by evidence before a committee of the House of Lords, that the keelmen of the Tyne receive less payment for their enormous day's labour than a London lighterman enjoys for conveying the same quantity of coal from the ship's side to the wharf. This, however, is only one of many monstrous abuses to which the coal trade of London is subject, and to which the people of that city submit with wonderful resignation. At Newcastle, coal is, as might be expected, remarkably cheap. I saw some of a fine quality burning in a gentleman's house, which, I was informed, cost only six shillings per ton, being rather less than a fifth of the price in London.

On approaching the mouth of the Tyne, our steamer shot past successive groups of vessels ranked up in some kind of order, to the extent of many hundreds, and waiting either for their cargo or a favourable opportunity of putting to sea. Opposite North Shields the masses of shipping increased in density, and here, penetrating through their ranks, the small steamer landed us on a slip of quay, apparently the only flat piece of ground in the town. North Shields, which may be considered the shipping port of Newcastle on the Tyne, is a most uninviting cluster of old red brick houses, stuck on the face of a hill overhanging the river, and is balanced on the opposite shore by a facsimile of itself, but of inferior dimensions, entitled South Shields. Plunging through the miry and tortuous lanes of this busy emporium of the coal trade, we emerged on a high bank beyond the town, and forthwith proceeded a distance of about a mile to Tynemouth. This is a retired and agreeable place of summer residence, very different in aspect from its neighbour, and, with its ruined priory, commands a charming prospect seaward. Immediately below is the bar of the river, distinguishable by the white foam which curls in masses over it, and through whose passages it requires considerable nautical skill to bring a vessel safely into port.

Some thirty years ago it was almost as difficult a matter to reach Shields from Newcastle as it was to reach Margate from London; but now all this is changed. First came steam-boats, and then a railway. At present, the railway carries the day; though the fare by water is only 6d., the locomotives have almost driven the steamers off the course. Having given our custom to the boats in going down, we thought it but fair to countenance the railway in going up. Distance eight miles—time twenty minutes—fare 9d.; the thing was well done. I never was on a railway which pleased me so much as this. The line proceeds over a flat tract of land, through the midst of villages inhabited by colliers employed in the pits, and crosses, by lofty bridges, two deep ravines with rivulets tributary to the Tyne. All the rails are firmly screwed upon square blocks of wood, laid longitudinally, and bound together like a frame-work, at the distance of every twelve feet or thereabouts. By these means, the rails rest throughout their entire length on a uniformly level basis, by which all jolting and lateral motion are avoided. After trying all the principal railways in England, as well as several in other countries, I have found none on which the motion is so easy and smooth as that between Newcastle and Shields; and I can ascribe this to no other circumstance than the mode of laying the rails on longitudinal bars of timber. In proceeding along the line from Shields, the train passes at the distance of about half way the church and village of Wallsend, with the colliery of the same name. This place marks the terminating point of the Roman wall on the Tyne. The various other villages, which are rapidly shot past, mostly consist of brick and tiled dwelling-houses of a humble order, for colliers and their families; but all, as was mentioned to me, are clean and comfortable to no inconsiderable degree, and each, as I observed, was furnished with a pig-house behind, the use of pork or bacon being universal in this part of the country.

On the south side of the Tyne, a railway, also lately established, connects Gateshead with Sunderland, and that being joined by another railway which branches off to Durham, this great and rapidly improving district may be said to be already laced all over with these admirable means of communication.

THE LITTLE FISHMONGER.

[BY MRS S. C. HALL.]

(From "The Britannia" newspaper.)

PEOPLE who live amid the hurry and bustle of large cities are seldom able to study the various shades of human character, like those who, having fewer objects to divert their attention, have also more time to observe. In great cities people come and go—you do not meet the same face perhaps more than once a-year—and then, except that time may have underlined the stronger features, the face is dressed exactly in the same manner—the same smile—the same expression, whether it be born of pain or pleasure—and, it may be, the same phrase is repeated, either in the way of question or reply; for those "greetings in the market-place" are all generally alike. In the busy world your sympathies have no time to take root; the wheel revolves, the kaleidescope is shaken, you forget and are forgotten, the more wide your field of observation the less leisure you have to observe; and though you have a moral certainty that every creature you meet has a distinct and positive character of his or her own, they dwell in your memory only as black, brown, or fair! These is the little Fishmonger, for instance, who lives with his small fry of children in that little bleak lonely cottage near the Canal. I have passed that man scores of times, hear his voice in the distance every morning of my life, know the names of every one of his children, and even of his little ugly cur dog Tickle, a misshapen, blear-eyed, cross-grained brute, as ever infested a high-road or narrow lane, and whom every cat in the village, acting upon the combination system, sets up her back at, be she at the street-door, or staring with her great green eyes out of the first-floor window. I thought I knew the character of the little Fishmonger, whose very name of Job was given, it would seem, in derision and defiance of every rule of Christian patience, for Tickle and Job are well matched. What the dog is, that is the master—and what the master is, that is the dog. Job is as lame upon his two legs as his canine follower is upon double the number; as ready to snarl and growl, and quarrel with the mistresses of the various cats, as the cats are with Tickle; in fact, the little Fishmonger's approach is the signal for a sort of running fire from cottage to cottage; every one quarrels with Job, every one buys from Job—for his fish are good, and he lays them nicely out upon a snow-white cloth, and covers them with fresh-cut grass. He is, of course, a violent Radical, and was still more so; but at a beer-shop where politics are talked over regularly and strongly, some one told Job that a new prerogative was to be given to mankind under the title of Socialism, which bestowed more liberty than Radicals, or even Chartists, had ever dreamed of before; inasmuch as men were to exchange wives, and wives husbands, at pleasure. Job presupposed a case—and which (considering how ill he had often treated his kind, gentle, and still pretty Mary) was very natural—he supposed that if Mary pleaded incompatibility of temper, and took unto herself another husband, what was to become of him, the three young Jobs, and Tickle? Job went home that night a silent man, did not visit the beer-shop the following night, hinted that he thought things were going too far, and that, perhaps, he might join the Temperance Society.

Still Job has not foreworn his opinions, and if any of his village customers, with the charitable intent of irritating *the little Fishmonger*, ask him what he is, he says, "What I always was," in a tone that effectually silences any further inquiry, at least for the time. Job has, I believe, no friends; the gentle patient creature who shares his toils and bears with his temper seems as much in awe of him as any one else, and his children skulk out of the sunshine and into the shade when they hear his footstep. He has now three little children—eighteen months ago he had six, but the scarlet fever carried off three in one week; the little coffins, covered with decent black, left Job's lonely bleak cottage in the snow of a December morning; the coffins were placed upon a hand-barrow, the undertaker supporting the front handles, and a kind neighbour bringing up the rear; while Job followed with his dog and his weeping wife. Very sad, indeed, the humble procession looked, so desperately dark upon the silver snow; but Job shed no tear, nor even thanked his neighbours who attended; if he felt, the iron of his stern-built frame suppressed the emotion. Of all men in the parish, Job has long been instanced as the most hard, the most severe, the most unyielding, but honest and true. His word was never doubted, nor his honesty questioned. He is, in short, a character over whom circumstances have no influence—he never moved his seal-skin cap in his life to any of the powers that be—he never went to see a sight but one, and that was a huge sturgeon, exhibited in Hungerford market three years ago—and then said, "he was a great fool, for it was nothing but a big fish after *all*." He never laughed, nor cried, except "Fine haddock and live sole," or "lobsters," with variations peculiarly his own, laying a long strong emphasis upon the word "lob-bb," and ascending by thirds into "sta-hi-hi-ers," and, strange as it may seem, the cry was by no means unmusical. "You cry lobsters very pleasantly, my mistress says," said the cook to him one day as he was—not *shouldering*, but, if I may be permitted to coin a word—"*heading*" his lobsters. "Does she?" quoth he, jerking the basket on his head; "eagh! it doesn't much matter; my cry's my own, and I shouldn't change it."

Still, notwithstanding his ungraciousness, Job felt the compliment, for he always stops at the corner, and gives the "Sta-hi-hi-ers" with as perfect melody as possible, and then jerks the basket, as much as to say, "I know I did *that* well." Now, would any suppose, from what I have said of the little Fishmonger, that there was a tender chord in his bosom, which reverberated as gently as the tones of an Æolian harp, if breathed over by the evening breeze—he who had followed three children to the same grave without a tear—who had uniformly treated his wife harshly—who was the bugbear of the neighbourhood, who was disliked by every housekeeper who bought his fish, whose surliness was a byword, who often ill-used the ill-favoured but most faithful cur that trotted at his feet; even Job had a tender morsel in his ossified heart:—and thus I know it.

There is an immensity of privation endured by the lower classes. As an Irishwoman, I see it less than others, because the peasantry of my own country suffer and bear so much more. Still there is a great deal, even in neighbourhoods where the rich spend much time, and more money, in visiting and relieving the distresses of their humble fellow-creatures. Somehow no one liked to visit Job; although it was observed, and, being observed, talked about, that Job carried herrings instead of haddocks, and shrimps instead of lobsters—that his cheek was less ruddy, and that poor Tickle not only eyed the butcher's shop, but absolutely purloined a bone, for which he was soundly thrashed by his master. Mrs Job was not met going to market as of old, and when questioned said, "she bought at night." Just when things looked "*suspicious of poverty*," Job fell and broke his arm; his pale pretty wife hawked the fish about for a time, and sad it was to hear her low gentle voice roused to the energy of a cry in the cold winter mornings. People bought from her though they did not want, for every one liked her. One of the ladies of our district committee met Mary and offered her assistance, which she thankfully accepted, and the same lady called at the cottage to repeat the gift; Job was unfortunately at home alone, and to the kind question of "Can I be of any use to you?" answered a gruff "No!" that offended a kind but warm-tempered visiter.

A pebble will sometimes turn the current of sweet charity.

Job got better—well, the people said; but even the small stock of herrings dwindled into half a basket of sprats.

"Job," inquired a cottager's wife, "Job, will you warrant these sprats?"

"No!" roared the little Fishmonger; and off he went, followed by the hairy shadow of what had been Tickle.

The question was repeated once and twice. Job had been imposed on, but was too honest to impose upon others.

"No," he vociferated for the last time; "and I'll carry them no longer," and he threw the sprats into the nearest ditch.

Lonely as his cottage had always been, it was more lonely than ever. The bed and bedstead, the chest of drawers, the clock, whose stroke had marked the hour each child was born, and whose iron tongue had knelled the time of the departure of three from a world of trouble—all were gone. His wife and children were cowering over the ashes of a miserable fire,

Digitized by Google

looking into the embers, with hungry eyes, that did not dare to look into the face of him whose harshness but increased their misery; when Job strode into what had been their bedroom, and locked the door; in a corner stood, or rather lay, a box covered with dust—he opened it, and brought forth an old violin.

Rizzio himself, in the presence of Mary, never touched a harp with more tenderness than Job, when he drew the dusty bow over the two last strings of his long-cherished instrument.

"Hush!" whispered his wife to her eldest living child. "Hush!" and then she burst into tears, while the youngest starveling said, with blue and quivering lips, "Mammy, *shall I dance?*—daddy never played music till now, since brothers died!"

Job came out after a time—the violin and bow had been carefully dusted and replaced in the box, which the little Fishmonger carried under his arm.

"Job!" exclaimed his wife, "you are not going to sell that, are you! Job, you have often said you would die to part with it; you've had it seven-and-twenty years. Oh! Job, the only times you've been kind to us, was when you played it—*it softened your heart, like*—it was a friend to us. I thought *the time might come* when you'd play it again."

Job made no answer, but quitted the cottage.

The little Fishmonger proceeded on his way, but not rejoicing. Any one who observed his firm and doggod step, his bent head, and the determined gathering together of his entire frame, could perceive that he was resolved to go through whatever he had undertaken, and that the undertaking was (to him) of consequence. We are all too apt in this hastily-judging world—we are all, I say, too apt, according to the old proverb, to measure our neighbour's corn in our own bushel—to fancy our own privation great, and our neighbour's small—to think, if the peasant-girl place a field-flower in her hair, that she trenches on our prerogative—indulges in a superfluity. But I must finish my story, and cease moralising. The little Fishmonger plodded on to the beer-shop, where he had first heard of the advantages of Socialism. "If," he thought within himself, "these people wish us all to share and share alike, surely they will take a shilling chance in a raffle for my poor violin."

Job entered the room. One fellow, the orator of the party, was making a speech, while another, acting on the principle of equal right to be heard, was singing a song. It was evident there did not exist among them even the rude courtesy that is shown by one labourer to another; each wanted to be first; none would be last. Some took the part of the orator, others of the singer, and the *little* Fishmonger, pressing his treasure more closely to his side, squeezed himself into a vacant seat, and waited the issue, or rather waited for a pause in the contest, that he might propose a plan, which was to save his children from immediate starvation, and deprive him for ever of his cherished instrument; he was right glad of the tumult—for it seemed to diminish that which raged in his own bosom: pride and independence had been tugging at his heart; and when, for a moment, he closed his eyes, to shut himself in, as it were, with his own considerations, his wife's ghastly face, and the blue quivering lips of his youngest born, rose before him. This forced him into action, much against his sullen nature, and, to the astonishment of the "company," he sprang upon the table, and, in a voice hoarse with unusual emotion, declared his desire to dispose of the cherished treasure of his soul by raffle, charging a shilling for each chance. There was an immediate desire to see the instrument.

"Shillin' a-piece for that 'un!" exclaimed a coal-heaver; "vy, I wouldn't give ye a shillin' for the whole—box and all."

"Play on the two strings, Job; let's hear the music," said another, sneeringly.

Job looked as though he could have knocked the speaker down.

"John Cummins," quoth the pot-boy, "sold a gayer looking one than that, last week, for five bob and a pint of purl."

"I tell you what, Job," said the butcher, who had often declared that, but for Job's fish, he could sell more meat, and consequently did not regard him with particular favour, "put it up at a silver fourpence a chance, and I'll begin by taking three;" and he struck the table with his fist, and looked round, as much as to say, "I have made a liberal offer."

"Too liberal," exclaimed another; "the whole *concarn* ain't worth it."

"If it was not worth it," answered Job, sturdily, "I should not bring it to be raffled for, though God knows, I ——!" the little Fishmonger was about to make a confession of his poverty, but he could not, and quietly stepped down off the table.

"God knows what!" inquired the butcher.

"*All things*," was the laconic reply, as he prepared to quit the house.

"Holloa!" said the landlord, "won't you stand any thing?"

"No," shouted Job; "there ye are all of ye, pretending to more liberality than the rest of the world—and—but no matter—God knows all things." He rushed from the house, and walked towards town. The consciousness that he had acted too hastily pressed him still more deeply into misery; and now, when no eye was there to bear witness against him, heavy and bitter tears coursed each other down the rough furrows in his cheeks. He came to the bridge which is thrown across the Canal—twilight had deepened into night, and the young moon threw a line of silver light upon its waters, that seemed a peaceful and secret bed for those whom earth rejects from her cares and sympathies. He laid the box on the wall, and leaning his arms upon the parapet, looked down upon the deep and narrow channel.

"If I was out of the way," he thought, "the neighbours would all look to Mary and the children; it's me they can't bear; but no one ever could bear me but poor Mary! After all, it's a dirty way of ending one's days; all mud, and not a good fish from one end to the other of it. So near home, too!" And after a lengthened pause, having, as it would seem, changed his purpose, he took up the box, and proceeded along the back road across the fields, passed Earl's Court, until he came to a lane where the Eagle Saw-Mills exult in noise and smoke, through Thistle Grove, that *olla podrida* of suburban architecture, across the Fulham Road, down Milman's Row—and there flowed the Thames. Apparently the poor fellow had resolved to throw himself off Battersea Bridge, but, on presenting himself at the toll-house, the man demanded a halfpenny. Alas! he had it not.

"Are you coming back?" asked the keeper.

"No," muttered Job; "I hope not."

"Because, if you were, you might leave that box in pledge," observed the man.

The little Fishmonger paused. "Well, I will," he answered.

"Stay," persisted the guardian of the bridge; "let me first see its contents."

Job stood half under the shed, and opened it.

"Why," he exclaimed, looking down on the venerable instrument, "it ain't worth a halfpenny!"

"Yes, it is," said a voice behind them. Both men were surprised, but the keeper touched his hat, for the new comer was an eccentric but well-known character, residing not quite half a mile on the Surrey side of the venerable bridge.

"Let me look at that instrument," said the gentleman.

Job placed it in his hands without speaking, but fixed upon his countenance the earnest, anxious look of one whose life depended upon his decision.

The gentleman turned it over, tapped it gently with his knuckle to ascertain if it was sound, peeped into the interior, again turned it over, smiled, and looked at the little Fishmonger, while taking the bow he held towards him.

"The bow is new—that is to say, new compared to the other," observed Job. "It's a good bow."

"Psha!" said the old gentleman, returning it.

"I bought it myself," added Job, rather offended.

"And the violin?"

"Ah! my father had it of an old Italian gentleman, who died suddenly; his things were sold by the landlady; and *having a turn for music*, he took it in part for wages due. He used to play on it to me when I was a child, to dance to it—to dance! God help me!"

There was a world of misery in the sound of that last sentence—"*To dance! God help me!*" But the old gentleman did not heed it.

"And you will sell it?"

The little Fishmonger was a chapman; but still he had suffered too much of prolonged sorrow during the past days—too much of intense agony during the last few hours, to think of his craft, and he eagerly answered, "Yes!"

"Before you tell me your price," said the gentleman, "let me ask you if you know what it is?"

"Ough!" grumbled Job; "to be sure I do—it's a fiddle."

"Ah!" said the stranger, drawing out his purse, "what do you want for it?"

"I would not part with it if I could help it—no money can pay me for it; but many that heard it said it was *prime*; perhaps—thirty shillings"——

"For *that!*" exclaimed the toll-keeper, contemptuously.

The gentleman emptied his purse into Job's hand; one, two, three, four, five golden sovereigns, and placing his card upon them, said, "Call upon me to-morrow, and you shall have the full value of your instrument."

He then buttoned it up carefully, as if it had been an infant, inside his cloak, and departed with the air of a man who had obtained his heart's desire. Job was for a moment as one palsied, but perceiving the stranger had forgotten the bow, he seized it, and ran after him.

"It is of no value," said the gentleman; "call on me to-morrow at twelve."

What Job received beyond the five guineas I do not know—but this *is* upon record, that the gentleman, a distinguished musical amateur, now boasts of the possession of a *real* Cremona; and the little Fishmonger has declared his intention of taking a shop in Victoria-road, and commencing business in a first-rate way.

He has engaged a man to carry his basket—Mary goes to market by daylight—and Tickle has grown so fat as to have lost much of his disposition towards worrying cats. Job also is decidedly better tempered, and absolutely laughs when he cries "lob-bb-stairs" at the corner. Prosperity has extracted much acid from his nature, and though the expression of his countenance remains the same, there is the evidence of a better spirit in the tones of his voice. In short, prosperity has improved our little Fishmonger.

A BEAR HUNT IN LAPLAND.

A peasant generally goes out in search of his trail, and, having found it, moves in a ring some miles in circumference, to make sure of having him within it. He then gradually contracts his circles, till he comes to the retreat itself of the animal. Weeks are sometimes expended in this search; the peasantry are then summoned to a skall by the landshofoding, or governor of the province, and put under the direction of the jogmoestare, or ranger of the district, who marshals them, and commands their movements. The peasants are generally formed into circles, and come armed with whatever weapons they can procure. Though opposed singly to a whole host, the bear often spreads havoc among his assailants. Every ball that enters his huge carcass but adds fire to his fury, and wo to the individual whom his wrath has singled out. It ceases to be a mere pastime, and nothing but the greatest self-possession can save him from a miserable death. While at Hernosand, I saw a representation of an event that took place at a skall in the neighbourhood, in 1831, and which shows that bear-hunting must be quite equal to tiger-hunting in excitement and peril. The bear on this occasion was very large; nothing like an American bear, with which an Indian can grapple, but an enormous beast able to carry off a pony under his arm. His temper, probably never very good, had been ruffled by ten shots lodged in different parts of his body; all present entrenched themselves, and awaited some desperate effort on his part, should not a lucky shot through the head speedily give him his quietus. At this moment, a man, bolder than his companions, advancing before them, the bear rushed upon him, tore the gun from his hands, and began to wound him with his tremendous claws. The wretched man was unable to contend with his muscular antagonist; already his wounds were letting out his life, when a young Norrlander, unable to look quietly on, rushed to his assistance. Besides the danger which he himself incurred, and which, of course, he had no feeling of, there was some difficulty in shooting the bear without striking the man. As he advanced, the bear rose on his hind legs to meet his new opponent: his victim dropped before him; the Norrlander seized the favourable opportunity, raised his gun with both arms high above his head, to bring it in a horizontal position on a level with the bear's, and, trusting to feeling more than sight, discharged his piece. An immediate death-wound could alone save either from their enemy. The success which the brave man deserved attended him, and the ball passed through the brain of the bear, which fell dead on the rescued man.—*Dillon's Winter in Lapland.*

MAXIMS OF BISHOP MIDDLETON.

Persevere against discouragements. Keep your temper. Employ leisure in study, and always have some work in hand. Be punctual and methodical in business, and never procrastinate. Never be in a hurry. Preserve self-possession, and do not be talked out of a conviction. Rise early, and be an economist of time. Maintain dignity, without the appearance of pride; manner is something with every body, and every thing with some. Be guarded in discourse, attentive, and slow to speak. Never acquiesce in immoral or pernicious opinions. Be not forward to assign reasons to those who have no right to ask. Think nothing in conduct unimportant and indifferent. Rather set than follow examples. Practise strict temperance; and, in all your transactions, *remember the final account.*

LOVE OF CHILDREN.

Tell me not of the trim, precisely arranged homes where there are no children; "where," as the good German has it, "the fly-flaps always hang straight on the wall;" tell me not of the never-disturbed nights and days, of the tranquil, unanxious hearts, where children are not! I care not for these things. God sends children for another purpose than merely to keep up the race—to enlarge our hearts, to make us unselfish, and full of kindly sympathies and affections; to give our souls higher aims, and to call out all our faculties to extended enterprise and exertion; to bring round our fireside bright faces and happy smiles, and loving tender hearts. My soul blesses the great Father every day that he has gladdened the earth with little children!—*Hope On! Hope Ever! by Mary Howitt.*

SONG OF THE HAPPY MOTHER.

[FROM THE GERMAN.]

Look at me, my pretty boy,
With thy golden ringlets flowing,
Bright blue eyes, and cheeks all glowing:
Was there ever such a one?
No; I'm sure there can be none.

Look at me, my sweetest boy,
Rosy as a summer morning,
Sweet as dew the leaves adorning:
Was there ever such a one?
No; I'm sure there can be none.

Look at me, my kindly boy,
Nor too froward, nor too fearful,
Ever kind and ever cheerful:
Was there ever such a one?
No; I'm sure there can be none.

Look at me, my darling boy,
No sad naughty child could ever
Be so loved and lovely—never.
You may wish for one as fine,
But, good folks, you shan't get mine.

Should a merchant come to buy;
Let him ope his golden coffers,
Would I take his richest offers?
Never—buy where'er he can,
He should not get my pretty man!

R. S.

LONDON: Published, with permission of the proprietors, by W. & R. CHAMBERS, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 441. SATURDAY, JULY 11, 1840. PRICE THREE HALFPENCE.

CORRESPONDENTS.

CONTRARY to all precedent, the conductors of this work have, from its commencement, declined to receive communications of any kind from unknown correspondents, being certain that, were the case otherwise, there could not fail to arise, out of so vast a circle of readers, such a multitude of weekly letters, and so great an amount of mediocre and inferior compositions, as would have engrossed our whole time, without any advantage worth speaking of to the work or to the public. We have from the first endeavoured to make the public aware, that the Journal, being a work designed for all who would read, and having in view certain definite results, is necessarily composed by individuals who act in concert, knowing to direct their efforts towards those results; and that, accordingly, nothing can be more unsuitable to it than the occasional productions of young and unskilled writers, who only aim at the glory of seeing themselves in print. It has also been shown that, while we were anxious to discharge every fair and reasonable duty of courtesy, we should have been unfit for any other employment, if we were to read and reply to every letter of remark, inquiry, and discussion, which our readers might be prompted, whether in the spirit of levity, or for serious and respectable objects, to send to us. Notwithstanding these announcements, a great quantity of communications of all kinds have been made to us by unknown persons, so great indeed as to prove in a very striking manner how hopelessly enormous must have been the weekly load which would have reached us, if any thing of the kind had been invited, or even tacitly permitted. Many of these communications have been from evidently estimable persons, containing either compositions of some merit, or remarks deserving attention; but the great majority have been of the kind which we from the first dreaded—verses by children in years or intellect, crude and trite essays, tales of ultra sentimentalism deficient in both character and incident, and letters which it would have only been a waste of time to read, if it were not that, in the very qualities which make them to us undesirable, they served in some measure to illustrate human character.

Chancing one day lately to have our attention directed to a vast pile of this forbidden correspondence—if it can be called correspondence which has never had but one party—it occurred to us that, after all, it might not be amiss to publish a selection of the offered compositions, and to take the desired notice of some of the letters of criticism and inquiry, so as at once to gratify the writers and to make the public acquainted with the state of the case. We propose to do this in the greatest possible good humour, and with the very reverse of a design in the least to offend particular parties. Let each correspondent only keep his own secret, and he is safe.

A great number of letters relate to circumstances of an unimportant nature connected with the work itself. A gentleman from the remotest corner of England or Ireland will think it worth while to let us know that the first sentence of a particular article, lately published, contained, to the best of his judgment, a grammatical error; while one word substituted for another in an immediately following passage from an English poet, seemed to him to deprive the said passage of much of its point. The payment of some fifteen or eighteenpence was not, in the days of dear postage, thought too much for the writer to give, to enable such a letter to reach us. There is indeed no circumstance too minute to be thought worthy of correspondence. One "constant reader" will suggest that the references in the index for our volumes should be to pages instead of numbers, though the former has been in reality the case since the second volume—a circumstance which a constant reader ought surely to have known. Another will ask in what number a particular article, of which he has a faint recollection, appeared. Some suggest alterations in the size of the sheet. Since Mr Rowland Hill has come into action, this branch of our correspondence has much increased. People will now write from all parts of the United Kingdom to inquire where and how they may get this and that—particulars which they ought to learn from the next bookseller. If a difficulty occurs about keeping a few of the sheets sewed together, the perplexed purchaser immediately devotes a queen's head, as he most irreverently calls it, to the purpose of asking the editors what he is to do, when, in truth, to parody Sterne's remark on Smelfungus, he ought to ask his wife or eldest daughter. Let not our readers at large suppose this to be a hypothetical case. An extract from a late letter, received from a very distant part of the kingdom, will show its reality. The writer, after some remarks of a complimentary nature, comes at length, as he says, "to the point," which point is this. "My neighbours, mostly artisans, and too poor to buy, requested me to let them have a reading of my copy. I felt pleasure in complying with their wishes; but *mark the consequences*. After a month's numbers had gone the rounds, owing to the way they were stitched, they were returned torn from where the stitch caught, half an inch; and, when again lent, the paper, thus torn, soon lengthened an inch to the right of the original rent. *What could I do?* I intended to keep them, to have them bound up in years; but, owing to this, I had to give up my intention, and now they remain almost useless. [Our correspondent then describes an effort he made to sew them up as books are bound, which he had ultimately to give up in despair—so that] *I had to relinquish the buying of them*, much to my regret. Many have complained to me that they were in a like situation. I am certain, if you could contrive some way to avoid this, many persons would take them that do not. When they get into this state, they are tossed about as almost useless; and the money is then considered to have been almost thrown away." We must own that, without this acknowledgment, we could not have believed that any reader would have given up a work which he professed to like, and the price of which is a mere trifle, because a great quantity of reading and thumbing wore it considerably. To think of the small price of this sheet being considered as thrown away, because, after some twenty people have read it, it has become a little ragged and unfit for binding—as if all this vast amount of reading (as much as one person reading a book of twenty large sheets) were nothing! Surely we have here a remarkable illustration of the insatiableness of the human heart. Something of the same kind may have been remarked in many quarters with regard to the cheap postage. People are relieved all at once from the long-felt burden of paying sevenpence at an average for every letter they receive, and, instantly after, instead of any joyful feeling thereanent, we hear only mutterings at trifling inconveniences, and ridicule at the peculiar appearance of the stamps and envelopes.

The inquiries for information and advice are so numerous and so various, that the most encyclopædic and most sage of minds would fail to answer them all satisfactorily. "A subscriber from the commencement" writes from the neighbourhood of London—"I shall feel obliged if you will inform me *what is a good thing for the voice*, for I am in the habit of singing, and after I have done so but for a short time, I become quite hoarse. I cannot take eggs," &c. A gentleman states that he is emboldened by our philanthropy to ask "what is the best and most expeditious mode of drying the inside of, and making fit for habitation, a newly built house." He is in great haste, too, for an answer, for he enters the premises at Ladyday, and his wife is somewhat poorly. Here are two things we never once thought of in our lives, yet about which we are expected to be as conversant as if we were opera-singers on the one hand, or builders on the other. We were some years ago requested to state by what steps a person might attain the situation of a serjeant of police, and more recently to describe the state of the law respecting the hiring of servants in Ireland. The respectable individuals who made these inquiries must allow us to express our surprise at being supposed to have such information at our fingers' ends. We can only account for such applications, upon the supposition that the great number of facts of one kind and another stated in every Journal, has at length led to a general belief that there is nothing beyond our ken. This would certainly be a very flattering supposition, but, we fear, it would not be much more sound than the notions which the people of most states are said to entertain respecting the wisdom of their rulers. It has been said that the world is in reality ruled by a very little wisdom; and so we suspect the Journal is conducted by virtue of a remarkably small stock of knowledge. We must not forget that our friends "the boys" sometimes make bold to approach the editorial throne. We had some years ago a most formidable communication from the secretary of a juvenile bathing club, calling our attention to the expediency of forming swimming or bathing clubs all over the kingdom, and holding occasional competitions at certain stations, in the manner of the Yacht Club regattas. We had also the honour to be addressed by "a young though constant reader," for the purpose of ascertaining if a round substance of a bluish colour, which people sometimes meet in the sea when swimming, has the power, as is usually said, of making those whom it touches feel as if they had been burnt.

In all of these cases, the subject of inquiry is comparatively trifling. In many others, it is no unfair calculation that to fully ascertain the point inquired about, would occupy us a week, and require, besides, some travelling. For example, we have been asked to state where the title-deeds of a piece of property in Lancashire, forfeited in the affair of 1745, might be found. In some instances, advice is asked about the most delicate domestic affairs. Persons residing in distant provinces will explain to us their whole circumstances, and ask how we should advise them to proceed—our advice, if we give it, being understood to actuate them towards decisions involving the whole future weal or woe of a family. A young person of fortune, whose home was in a remote part of the United Kingdom, and who lived disagreeably with his relations, once actually came to Edinburgh, to seek counsel from two humble individuals who have their own troubles to contend with, and are only conscious of forming a channel through which the maxims of general and traditionary wisdom may be communicated a little more largely than heretofore to society. Individuals who think of settling temporarily on the Continent for the sake of economy or the education of their children, will write to us from the most distant parts of England, minutely describing the state of their family and pecuniary circumstances, and requesting us to point out the places most suited to their purpose. In more than one such letter, the writer discusses the attractions of various places, in a manner

Digitized by Google

which shows, what he would perhaps scarcely believe, that he knows ten times more of the matter than we do, having probably done that which we never did, namely, turned his attention to the subject, and been for some time in the habit of conversing on it with all who really had any information to give. We are often, as might more reasonably be expected, asked to point out the most eligible colonies, with a view to emigration. Here also we have sometimes very minute specifications of circumstances, joined to a request that we should take all these into consideration, and advise accordingly. The request is certainly an honour, and we trust it can never be supposed that we do not sympathise heartily and earnestly in the anxieties of these parties, albeit we never saw, and probably never shall see them. We are also sensible of there being a great and deplorable cause for such applications, in the faithlessness of many of the books on the colonies. Unable to depend on what they find in print, the intending emigrants eagerly seek for the testimony of some tangible person; and to us they come, as almost the only individuals with whom they think they can have any confidential communication. It is generally with sad hearts that we receive and read these letters, for we are at once anxious to do friendly service, and yet sensible that in such cases we cannot and ought not to interfere. In some instances, even while we sympathise with the writer, the letter will irresistibly raise a smile, from the very simplicity which it evinces. Amongst a bundle of epistles of this kind, we find one of pretty old date, which we should be glad if we could present in full to our readers, without any risk of giving pain to the writer, towards whom we feel nothing but good will. It is from a middle-aged married man, exercising the profession of a teacher in one of the southern counties of England. He commences, as almost all such correspondents do, with a panegyric upon our humble labours, and a hope that his addressing us will not be deemed intrusive. He then proceeds, in about three long and closely filled pages, to give a history of his life, and an account of his existing circumstances, which he was somewhat dissatisfied with. He wishes to change, either to some other school, or to some other kind of business. Having hitherto made little or nothing, "I should," says he, "give a decided preference to such occupation as would afford the safest and surest mode of realising a competence." After another long and closely filled page respecting qualifications, he re-commences under a new date. He has in the mean time turned his thoughts to emigration. He then details a totally different set of qualifications, having a regard to the condition and prospects of a settler in one of the colonies. He recollects that he has always had a liking for gardening. He "can *handle a spade*, and is not averse to manual labour." He wishes to know what part of the globe would be most suitable. He looks ultimately to the purchase of land. He would wish to fix himself where the soil is most valuable for agricultural purposes, and where the climate is most salubrious, and not differing very much in temperature from the one to which he has been accustomed. These points being settled, he would wish to secure the best advice as to *all the minutiæ of procedure*, whether to apply to any of the emigration companies, what articles to take with him, the most prudent precautions to be taken by one possessing a small capital, and so forth. Might he not unite his former to his new profession in his new country? He then enters into a long exposition of what he thinks he could do in a literary capacity in a remote settlement. Finally, after six dense pages, he expresses his fear that he may not have made his case yet plain enough for our forming a judgment upon it, but entreats that nevertheless we shall speak to it as well as we can. To have been able to say ten decided words in answer to this gentleman's inquiries, we should have required to visit him, and spend at least a month in the study of his character and circumstances, and, after all, it would have been the most painful responsibility we could have incurred if we had taken it upon us to advise him in what part of the world to bestow himself!

Letters from men who have entered learned professions, and are not prospering in them, are not uncommon. While perhaps holding a high head in some provincial or metropolitan situation, they pour into the ears of a pair of distant strangers the bitterest complaints of the ambition or misjudgment of parents, which has condemned them to a position in which they are virtually idle, and have no hope of ever realising a subsistence. We hear of the *law's delay* in a different sense from that generally thought of. These individuals seek our aid and counsel, with a view to changes which could not be breathed of in their own neighbourhood without injury to their present prospects, such as these are. The woes attending the more ambitious walks of life are thus brought before our eyes in a way quite peculiar, and which conveys the most painful impression of such courses in a country like this, where all the beaten paths are overcrowded. Another class of applicants are youths just about to enter the world, whose minds have been stimulated by the cultivation now so common, but who feel trammelled and bound down by harsh, degrading, and unworthy circumstances, which they know not how either to submit to or to overcome. Placed perhaps in obscure and remote situations, they have scarcely one congenial spirit near, to whom they can communicate their feelings, or from whom they can seek advice. But this little sheet weekly comes before them, with words which they honour by calling wise, and sentiments which they deem generous and philanthropic; and finding it to be, as it were, their only friend, they turn to its editors for a helping hand in their darksome struggle. Many affecting tales thus reach us, of the force of which *we*, certainly, may well be sensible; but how is a stranger to interfere in matters so delicate, and so full of responsibility? Principles we may expound, and a general spirit of benevolence we may seek to encourage and extend; but we, of course, neither can nor ought to take it upon us to direct the fate of individuals. Let one remark of experience here attend the sympathy which we would express for this class of our correspondents. It is alone the energies native to each man, and not any external aid or advice, which can steadily or certainly enable him to become the master instead of the slave of circumstances.

POPULAR INFORMATION ON POLITICAL ECONOMY.

FIFTH ARTICLE.—CAUSES OF DIFFERENCES IN THE AMOUNT OF WAGES.

On a former occasion, namely, in No. 377, we considered this important subject at some length, chiefly with reference to capital, as the general fund out of which the whole amount of wages must come. We propose on the present occasion to turn our attention to the circumstances which rule the distribution of the fund, and regulate the proportional amount of wages. Wages is the word used for expressing the return which a man obtains for his labour, whether it be employed in the production of a commodity in demand in the market, or assume any other form in which it will be remunerated—such as menial service. When a cooper makes a cask, and charges a certain sum for it, the whole of that sum is not wages: part of it is the repayment of what he has expended for wood and in the use of tools, with the usual profits; the remainder only is wages. The price, however, of a basket made of osiers plucked on the wayside, without expense to the maker, is wages. The chief distinctions which have been taken on the subject of wages, are on the question of extent. Simple, however, as may at first sight appear the distinction into high and low wages, it is one the elements of which political economists have been completely baffled in the attempt to lay down, and it is pretty clear that any rules on the subject can only be of an approximating character. Some have employed the simple element of money, calling wages high when much is given, and low when little is given. However clearly this criterion may distinguish the extent of two sets of wages both paid at the same time, or within an immaterial period of each other, it will be difficult to make it a means of comparing the relative state of the working classes at two distinct periods; for the precious metals themselves, though not subject to the same sudden fluctuations as other commodities, may become changed in value to a material extent, after the lapse of a long interval. Thus, "The differences," says Mr Senior, "which have taken place in the amount of money wages at different times, inform us of scarcely any thing but the abundance or scarcity of the precious metals at those times." Nor is mere money a proper criterion in comparing wages in one place with those in another at one point of time, for there are many adventitious circumstances which will make the same sum "go much farther," as it is called, in one locality than another, even though both be within the same kingdom. Three shillings a-day in Dublin will make a man as well off in every point of view as four shillings will make him in London.

Another criterion attempted has been, the proportion which the labourer receives of the produce of his labour, as compared with the quantity that goes to the capitalist. Perhaps, by taking the whole amount of the produce of labour in any one country, and finding what proportion of it is divided among the whole labouring population, an estimate might be made of their position, or, in other words, of the amount of wages. This would be an unfair criterion, however, in individual instances, for the circumstances which elevate or reduce the labourer's wages sometimes affect the returns of the capitalist to a still greater extent. When wages are at a miserably low ebb, the manufacturer's profits are sometimes proportionally lower; sometimes they are extinct altogether; and he keeps up his trade merely because he has embarked capital in it, which, if he stopped, would be entirely, instead of only being partially, lost. In these circumstances, the labourer, though he may receive *the whole* of the returns procured for the produce of his labour, may be very poorly paid.

Of the economists who have adopted some one article as a measure of wages, those who have taken grain have certainly been nearer the truth than those who have taken money. Wages, they say, are high when the labourer gets much food, or what will buy much, and low when he gets little. It is obvious that, if not the whole, by far the greater part of the wages of labour will be included under this measurement. If one hundred shillings in one year will procure but one quarter of corn, and in another year will procure two, the labourer having on both occasions the same money wages, is, in the latter, not quite twice as rich as in the former (for rent, clothing, &c., have to be taken into consideration), but he is at all events much richer. This, however, is a measure which, the greater the wages are, and the higher the labourer rises in social condition, loses its accuracy. To be a perfect measure, indeed, it would presume food to be the only commodity on which wages are spent: and to make it approximate accuracy, it must presume only a small portion expended on other things. Thus, to the pavier, who is perhaps earning 15d. per day, the price of grain is of the utmost consequence in elevating or depressing his wages. To the physician or barrister, who may be making several guineas a-day, and who, perhaps, uses no more grain than the pavier, the price of food, as it directly affects him, is not an object of a moment's consideration; and so in the grades between these two extremes. The higher, indeed, the wages are, and the greater therefore the quantity of artificial wants, the less accurately does the quantity of food they will procure measure their amount.

Another method which has been suggested for measuring the extent of wages, is by the amount of commodities of all kinds which they will procure for the labourer. In using this test, however, for the purposes of ascertaining the respective position of the working classes at different periods, we must compare their comforts and luxuries with those possessed by other members of society. The same amount of these commodities at two different epochs of history, mark very different relative ranks. It is often remarked, that a well employed labourer of the present day possesses more comforts and luxuries than ever fell to the lot of one of our Saxon kings: yet, if it be the case that other classes of society have had their comforts and luxuries increased in a still greater ratio, it cannot be said that the relative position of the labourer is elevated. During the last half century, a wonderful diminution has taken place in the price of manufactured goods—a diminution by which the labourer's position has been materially improved. Yet, unless it has been improved by this means to the same extent to which that of the other classes of the community have been benefited, it cannot be said to have been elevated—in other words, wages cannot be called higher. Fifty years ago it may have taken ten days' wages to procure for the labourer's wife the printed calico gown which may now be had for one day's labour; yet were wages reduced by even one-third of what they were fifty years ago, there is no doubt that they would be virtually lowered. Thus difficult is it to find any means by which the amount of wages can be accurately measured: but there is no doubt that all the methods proposed have their respective uses, in providing us with the means of at least approaching the solution of that very important problem—perhaps the most important in the science of political economy—whether the labouring portion of the community is well or ill remunerated.

In a commercial and manufacturing country, such as ours, where almost all the labour is sold, and there are very few who apply the produce of their exertions entirely to their own domestic uses, the means by which labour is set agoing is capital—a subject which has been considered in another chapter. The extent to which this impulse is in existence, will materially affect the extent to which labour can be made use of. If we presume that it is unlimited—that is to say, that wherever there is an opening for its application, it is forthcoming, then the relative amount which the different kinds of labourers will receive in wages, will depend on two circumstances—the extent to which the species of labour they are able and willing to execute is in demand, and the number of individuals who are prepared to supply that demand. When the demand is great, and the number prepared to supply it small, wages are high; and when these circumstances are reversed, they are low. It is a common fallacy to overlook these regulating circumstances, and to consider the amount of wages as regulated by the price of the necessaries of life—to say that wages will be high when food is dear, and that they will be low when food is cheap. Wages can only be regulated by the price of the necessaries of life in one particular case, which is, fortunately, of very rare and limited occurrence; it is that where the labourer, instead of disposing of his labour as a trader, is merely kept in existence by his employer like a domestic animal, for the sake of the work that may be obtained from him. Matters can only be in this state when labourers are so numerous in comparison with the demand for labour, that, from their underbidding each other, the employer could hire them at less than what would support life, were it not that then they could not labour. In this case, and this alone, the wages given will depend on the price of necessaries, for of these the labourer must have a certain quantity, otherwise the employer loses his labour. When provisions are lowered in price, the employer can lower his wages, because the competition being for bare subsistence, he knows that if those who have hitherto worked for him decline to do so, others will be glad to take their place. In the case, however, where wages, depending on the number of individuals capable of meeting the demand, are beyond what is barely enough for subsistence, both parties are in a state of competition; and if the labourers be underbidding each other, the employers

Digitized by Google

are overbidding. It were an idle use of words to tell an artificer, whose labour is in demand, that he must work for less, because bread is cheap. If wages, indeed, were thus measured by the means of subsistence, there are circumstances necessary for the continuance of the species, which would of themselves make marked distinctions in the rate of wages. They would have to be increased or decreased, according to the largeness or smallness of a family; whereas, in practice, the question whether a labourer is a bachelor in lodgings, or the parent of twelve children, is one which the employer has no occasion to ask.

As there are great varieties in the amount of wages for different kinds of labour, so are there of the intensity of the labour given in return. The smaller the number who are capable of performing the sort of labour wanted, in comparison with the demand, the greater, as has been before remarked, is the amount of wages given. Incidental circumstances apart, then, the reason why the number is smaller will be because the labour is more difficult. Adventitious circumstances, the most material of which is education, will have, in many cases, the effect of giving the few their superiority over the many; but in more instances than are generally imagined, native energy and intenseness of exertion accomplish the distinction. The unskilled labourer, working on small wages, looks frequently to the wealth of the busy member of a higher profession, as one incidentally favoured through unequal fortune, without reflecting that the labour by which it is bought is fully as much greater than his own, as the lot of the possessor is more felicitous. The qualities by which great things are accomplished, are firm endurance, the exertion of much thought and calculation, and the resignation of immediate gratifications for future advantages. These qualities are comparatively rare, and it is because they are so that they generally bring in the end great worldly advantages to those who exercise them. The labourer, who sluggishly gives forth his daily amount of physical strength to satisfy the cravings of nature, is apt to view the results with envy, and but seldom reflects that the reason why he himself does not attain them is, because he is either unable or unwilling to support the continuous and calculated exertion and the sacrifice of ease by which they are purchased.

The amount of wages that can be procured by a man in any particular line, constitutes almost the only means we possess of estimating the extent of the labour he incurs, because the greater the extent of the labour (in other words, the difficulty of performing the work required) the fewer are the persons who will be capable and willing to undertake it, and these fewer, before they consent to relinquish the comparative ease enjoyed by the followers of less difficult pursuits, must be bribed by a higher rate of remuneration. Incidental circumstances, however, tend so far to disturb this measure, that in particular cases it is frequently not to be trusted to. Ambition will prompt many a man to undertake very intense labour for a small remuneration—hence, where the labour is equal, the less honourable the trade the better it is paid, unless it be so far degrading that none but vicious characters will engage in it. We can often then pronounce one trade to be more laborious than another, independently of the wages in each; if it so happened, for instance, that a skilful watch-maker received no more than a hand-loom weaver, we should undoubtedly say either that the former was under, or the latter overpaid, owing to the operation of some circumstance tending to disturb the course of the labour market. It so happens that an incidental circumstance at the present moment depresses the wages of the hand-loom weaver, to an extent which has created a vast amount of misery. The circumstance in question is the introduction of the power-loom. The effect of this has doubtless been very great; but in looking to the misery of that unfortunate class, too much perhaps has been attributed to the introduction of machinery. Hand-loom weaving happens to be a very easy trade—perhaps the easiest in which any considerable number of men has in later times been employed—and the indolent and unenterprising are loath to abandon it. During the rapid progress of the cotton manufacture, there was a demand for this description of work, which raised the remuneration for it above its natural scale, when compared with other kinds of labour; and a class of men were thus brought into existence, who, accustomed to gain their bread by a small amount of exertion, were peculiarly unfitted to be turned adrift to choose a new profession. Circumstances thus tended in the first instance to elevate this pursuit above, and afterwards to depress it below, its natural level. Still greater revulsions have occasionally taken place on a smaller scale. On some occasions, during the progress of the war, gun-lock makers have been known to be paid a guinea a-day. Such high remuneration prompted many to follow the trade, who, on the return of peace, found that it sunk below the average of other handicraft occupations.

The proper price of labour may be disturbed by a monopoly, whether occasioned by the operation of law, or by voluntary combination. In the former case, the responsibility generally lies, not with the individual labourer, but with the legislator; in the latter, it is solely at the door of the labourer, who thus sacrifices others to the desire of obtaining money without working for it. Presuming a certain sum of money to be the amount which the community is able and disposed to expend on some branch of labour, a combination among the individuals who practise it may assume either of two forms. They may limit their number, and thus compel the sum to be spent in such a manner that each of them shall obtain more wages, and that the amount of labour executed shall be less than would have been the case had there been free competition; or, secondly, if their numbers amount to or exceed that which free competition would produce, they may insist on working only to a limited extent, and thus obtaining more wages for their work than they would have procured in a free market. In either case, the wrong done is this, that the labourer obtains money for work which he has not done. In the one case, he is paid as if he had performed a more difficult kind of labour than he has done; in the other, he is paid for little labour as if he had given much. The question is—who are injured? It is not the capitalist, for what he has to look to is merely the profit of so much outlay; and if the public have a certain sum to give him for what he produces, it is of no consequence to him whether it be given for much or for little of the commodity. By bringing the capitalists of other nations to compete with him, to be sure it *may* affect him; but this is a separate question, in which, as shown in another paper, the workman is more concerned than his master. The person, then, on whom the overcharge of the labourer falls, is the consumer; and it is of importance that we should know on which class of consumers it falls most heavily. The answer is easily given—it is on the poorest class. The poor spend nearly their whole income on the produce of labour; the rich only spend part of theirs; and if they procured but half the quantity of commodities they do, they would not be great losers, while the poor are materially benefited or injured by a slight increase or decrease. Horses, dogs, works of art, and an array of servants—articles in which the wages of ordinary labour are but a partial ingredient—form the principal subjects of the rich man's expenditure. As to his bread and linen, it would not materially affect him if they cost double what they do; while an increase of five per cent. on these articles would be materially felt by the poor man. Before the late improvements in the cotton manufacture, calicoes were a coveted and admired dress among the higher classes, because they cost six times their present price. If we could imagine combination existing to such an extent as to restore them to their old cost, the rich would resume them with the same pride as before; but how great would be the loss to the family of the poor man? Let it not be lost sight of, that every combination to raise wages, creates a distinct and palpable loss, nearly the whole of which falls on the working classes.

AILEEN A-ROON,*

A LEGEND OF IRELAND.

THERE was preparation for a great festival in the halls of Kavanagh. On the morrow, the young heiress of that ancient house, a princely one in the elder days of Ireland's history, and still distinguished and wealthy, was to be wedded to a neighbouring chieftain and relative, her equal in rank and fortune. Great was the joy of the father and kin of the maiden on this occasion. But what were the feelings of the principal party concerned? On the evening preceding the day appointed for her nuptials, Aileen Kavanagh sat in her chamber, weeping bitterly. She had given her consent to the ceremony which was to take place, but that consent had been wrung from her by ways and means of which she was now suspicious. She had been told that the youth to whom she had long since given up the whole treasure of her affections, was false to her, and had wedded another. Carol O'Daly, brother of Donogh More, the chief of one of the most ancient families of Connaught, had been the lover of Aileen. He was one who had no equal among the youths of Connaught, as regarded either personal qualities or mental accomplishments, to which latter possession, indeed, comparatively few even of the noble and wealthy could lay any strong claim, in the days to which our story refers. Carol O'Daly had never met his superior in feats of arms, yet his own tastes were peaceful, and he cultivated all the elegant arts of the time with such assiduity, that, had experience not taught them to speak prudently when they mentioned the name of Carol, the rude chieftains of Connaught would have called his likings feminine and unbecoming. As it was, O'Daly became renowned for his skill on the harp, and no professional minstrel of the country would have dared to compete with him. When Aileen Kavanagh was just blooming into womanhood, Carol was a friend of her father, and a visiter at his castle. It may be imagined how brightly he shone in her eyes, when contrasted with the less polished chieftains around. She was herself passionately fond of music, and he taught her so to touch the harp, that she became, to use his own words, "the only rival of whom he was afraid." The pair loved each other, and at this moment every thing smiled on their love. But the Kavanaghs quarrelled with Donogh More O'Daly, and, though no actual contests followed between them, an enduring coldness took place of their past friendship. Carol was frowned away from the castle of Kavanagh, though he left it not till he had won a pledge of faith from Aileen, and had in turn vowed to her enduring constancy.

To clear his brother from unjust charges which had caused the English viceroy to outlaw the whole name and clan, and to while away the interval till better days might come, Carol O'Daly left his native district to visit the court of the viceroy. It was at this time that the father of Aileen pressed her to give her hand to a relative, whom he wished to make the supporter of his house and family. The maiden confessed, and pled in excuse, her affection for Carol O'Daly, and her engagement with him. After a short interval, finding her inclinations not to be otherwise overcome, her father informed her that her lover was false, and produced witnesses, who so far gained on the credulity of Aileen, as to cause her hastily to assent to the union proposed by her father. But all her lover's truth and nobleness of nature rushed afterwards upon her recollection, and she became miserable at the thought of what she had done. As the time fixed for the nuptials approached, that misery increased to excess. On the day, however, which preceded the fatal one, an event occurred which admitted a ray of hope into her mind. An old attendant, who had been the confidant of her former engagement, brought her a letter from Carol O'Daly. He had heard of her intended nuptials, and of the calumnies invented against him; and he besought her to grant him an interview, and allow him to clear himself in her eyes before it was too late. The night preceding the nuptial morn was the earliest on which he could arrive, and even then it would be only by the utmost speed of his good horse that he could accomplish the journey.

Hour after hour passed away on that night, and Aileen, who had entreated to be left alone, sat in her chamber weeping, for Carol did not arrive. Her old attendant, who filled to her the place of a mother, and who was the only person beside her, in vain strove to cheer her sinking heart. The night was a dark and stormy one of winter, but in spite of its inclemency, Aileen was ever and anon at the window looking out. From this vain task, she turned always to her harp, a memorial of her lover, which was at the present moment unusually dear to her. Midnight came and went by. The heart of the maiden grew heavier and heavier, and her lamenting found voice in song.

AILEEN'S SONG.

The night is dark, the wind is high,
And fiercely drives the sleet:
It seems as all had vow'd that I
And Carol should not meet.
Yet well I know his dauntless heart,
And well I know his faith;
But one thing will his purpose thwart—
And that one thing is Death.

They said that he was false to me,
That he had bow'd to gold,
And, where his heart could never be,
His hand had basely sold:
I did a while believe their guile,
But soon I felt and knew,
That Carol's love as heaven above,
As truth itself was true.

More wild and loud the storm has grown,
And darker is the night:
Unmindful of a maiden's moan,
The moon withholds her light.
Oh! what if Carol lose the way,
Or perish in the flood!
The thought forbids my heart to play,
And curdles all my blood!

Look out, ye pitying stars above,
Look out, thou gentle moon!
Give light and guidance to my love,
And bring him to me soon.
Of all my earthly hopes and fears
This night it bears the sum:
But wherefore blind myself with tears?
Oh, surely he will come!

The hours of night ran on, and still no signal of the lover's arrival was heard under the window of the unhappy Aileen. Again and again did she send her aged nurse to the private postern by which they expected to receive Carol, and of which the attendant had taken care to secure the key. But the wished-for visiter was not to be seen. Anxiety about her own fate was now mingled, in the mind of Aileen, with fears for the safety of her lover on a night so dark and stormy. She prayed for the appearance of the moon, with a fervour only to be conceived in such a case as hers. At length, she was conscious of a light breaking slowly into her apartment. She started up, and rushed to the casement, only to sink back in deeper distress than ever, for it was the light of dawn.

But for the prayers and entreaties of her attendant, the despairing Aileen would have left the castle, and sought, in the tender mercies of the storm, that refuge and relief which seemed denied to her from all other sources. The anxious and attached nurse, however, poured out assurances that Carol would never desert her, but would yet find means to save her from the fate she dreaded; and the heart of the maiden derived some little encouragement from these assertions. The day was spent by Aileen in mingled agonies of fear and hope. She kept her chamber under plea of preparation for the ceremony, but all the preparation requisite was made, not by her, but by her attendants. The evening came, with a speed which seemed to her unnaturally great; and the castle was filled with the kin of the Kavanaghs, prepared to hold joyous festival. Aileen, though sick to death at heart, was compelled to grace with her presence the reception of the visiters, to whom, notwithstanding the languor of her move-

* Aileen a-Roon. "Aileen (or Eilen) the *secret treasure of my heart.*"

Digitized by Google

ments, she seemed the fairest of human beings. Happily, the youth to whom she was immediately to be wedded was not of ungentle nature, and seconded her wish, which she was at length compelled to express, for leave to compose herself by a short retirement. She had passed to a corner of the hall for this purpose, when, rising gently amid the other music, the sounds of a single harp arrested her ear. The air it played was new to her, but of surpassing sweetness, and thrilled her very heart. She looked to the spot where the harper sat, and saw a figure, with snowy hair, and bent seemingly with the load of many years. She drew nigh, as if attracted involuntarily, to the secluded place which the harper occupied, and heard him pour forth the following words, in unison with his music, and in tones so low that the crowd heeded them not. But the ears of Aileen caught the sounds as fully as if they had been uttered by a thousand voices.

THE HARPER'S SONG.

Here is thy home to be,
Aileen a-Roon?
Or wilt thou go with me,
Aileen a-Roon?
Far on the mountain side,
Wilt thou become my bride?
Or wilt thou here abide,
Aileen a-Roon?

Think of the happy hours,
Aileen a-Roon,
Wait us among the flowers,
Aileen a-Roon:
None whom you here may see,
Ever can love like me—
None else would *die* for thee,
Aileen a-Roon!

Think of my breaking heart,
Aileen a-Roon!
Oh are we thus to part,
Aileen a-Roon?
Here then amid my foes,
Come I my life to close—
Welcome the grave's repose,
Aileen a-Roon!

Blow never fell on me,
Aileen a-Roon,
But was repaid with three,
Aileen a-Roon:
Yet on thy kin my arm
Ne'er shall alight in harm—
Fatal but strong thy charm,
Aileen a-Roon!

Oh think how fond our love,
Aileen a-Roon!
All other loves above,
Aileen a-Roon!
Ne'er did the tribes of air
Number a truer pair—
Oh must I now despair,
Aileen a-Roon!

The agitated maiden knew that Carol was before her, and hope and terror contended so strongly in her breast, that she would have fallen to the ground, had not her nurse, who, having introduced the harper, had been watching the scene, passed quickly to her side and supported her. Aileen took advantage of the permission to retire formerly given her by her father, and moved with her attendant from the apartment, only whispering tremulously in passing her lover, "Thine—thine only!" By this time, however, her stay had been noticed, and some of the visiters were attracted towards the strange harper. Carol broke out into a verse which seemed as a common harper's welcome to a bride, but which bore a different meaning to the ears of the retiring maiden herself:—

Cead mille failte,
Aileen a-Roon,
Cead mille failte,
Aileen a-Roon.

When the harper had thus sung a "*hundred thousand welcomes to Aileen, the treasure of his heart,*" he was silent, and the attention of the company was soon diverted from him. Seeing this, he rose slowly, and, with the step of apparent age, left the hall. In a few instants, knowing the castle well, he had made his way to the apartments of Aileen, and had folded her in his arms. "Aileen, beloved!" he cried; "I am come!" "Oh save me—save me!" was her reply. "I will; I can!" he returned. "Horses wait us but a short way hence; and there, too, is Donogh More, and my brave brothers, with many a good arm besides, to guard and rescue thee! They would have stormed the castle, Aileen, before the betrothed of Carol O'Daly should have been lost; but I would not shed blood akin to thine! Come, thou shalt be saved without blood! Come, my beloved!"

In those rude feudal days, when matches were seldom made upon the fair principle of mutual liking, an escape such as that proposed to Aileen by her lover was not so apt to shock the better feelings of a well-disposed maiden as it might now be. Aileen fled with Carol O'Daly, and fled safely. The Kavanaghs soon discovered their loss, and, suspecting the truth, pursued the fugitives, but in vain. A deadly feud was like to have followed, but Donogh More O'Daly, who was restored to peace with the ruling powers chiefly through the impression made by his brother at the viceroy's court, gratefully defended the fugitives, in such a way as to show the father of Aileen the prudence of coming to terms. A joyous event this was to the bride of Carol O'Daly, and not unimportant to the welfare long afterwards of their children and children's children.

The air which Carol O'Daly played in the castle of Kavanagh, and which had sprung up in his mind while musing sadly upon Aileen and journeying to her rescue, is known in Ireland by the name of Aileen a-Roon; and the words which he sung are also extant, though we shall not say that those given here contain any thing more than a partial glimpse of some of the ideas expressed in the original. The incidents now related are familiar to this hour to the common people in Ireland, and the expression "Cead mille failte," first used by Carol O'Daly, has become a byword among them. Scotland has sometimes put in a claim for Carol O'Daly's beautiful composition, which also bears the name of Robin Adair, but there can be no doubt entertained that its origin is Irish. Handel is said to have declared that he would rather be the author of Aileen a-Roon than of all the great works he had executed.

OCCASIONAL NOTES.

INTERESTING ANECDOTE OF EMANCIPATED NEGROES.

A FRIEND, residing in Scotland, has communicated to us the following most interesting anecdote, of the truth of which our readers may rest fully assured:—

"Alexander Finlay, a native of Edinburgh, was, at an early period of life, sent out to Jamaica, and took his post as a book-keeper on a plantation, where he rose to be an overseer, and is now an attorney, having the charge of several estates. If I may judge from the good feeling and good sense which appear in his conversation, he must have been a favourite with the negroes, and acquired a thorough knowledge of their character and habits.

The average produce of one estate, put under his charge (I believe, though I am not quite sure, the very estate on which he had been educated), was, during the last twenty years of slavery, sixty-seven hogsheads of sugar, and the expense of management some hundreds of pounds per annum. As soon as the term of apprenticeship commenced, he, then the attorney for owners at home on whose confidence he could rely, paid off all the European officers, and gave the charge of the negroes and the labour to negroes whom he thought qualified for the duty, not by their education, for they could neither read nor write,* but by their character and habits. The produce rose to ninety-seven hogsheads, and is now *one hundred and five*, and the expenses of management do not exceed L.50 per annum, chiefly gratuities to the black men, who do the duty of book-keepers and overseers.

This is the account given to me by Mr Finlay. He is a plain man, without any affectation. I have confidence in all he says; and it is confirmed by the overflowing gratitude of his owners, ladies, who are surprised to find themselves so rich.

The greatest of his difficulties, when he set about the work, was the violence of opinion against him amongst the white public."

THE POLITICAL PREPOSSESSIONS OF ROBERT BURNS.

The general impression respecting the political feelings of Burns, is that they were of the liberal stamp. They certainly were so, and to an ultra extent, in his latter days; but this is far from being true of the earlier period of his life. In the year 1825, two gentlemen having had a dispute and a bet on this subject, one of them wrote to Sir Walter Scott, to request that he would, if possible, decide the question for them, when the author of Waverley replied in the following terms:—"There is not the smallest question that Burns, when he first came to Edinburgh, was a keen Pittite, and a Jacobite to boot. The latter feeling, he somewhere says, was a matter of sentiment rather than reason, but he was quite serious in his approbation of Pitt's administration. The whole ballad beginning

'When Guildford good our pilot stood,'

is an eulogy on the prime minister, and a very warm one, and he is mentioned as a subject of panegyric in his Ode to the King on the Birth day. After Burns went to Dumfriesshire, and the French Revolution broke out, he adopted other views in politics of a more popular nature, and of course the minister sunk in his estimation; but down to that period he was an admirer of Mr Pitt. (Signed) WALTER SCOTT.

Edinburgh, 21st February, 1825."†

Sir Walter, also, in a note communicated to Mr Lockhart, and printed in his Life by that gentleman, alludes to some "passing stupid verses in the papers, attacking and defending his [Burns's] satire on a certain preacher, whom he termed 'an unco calf.' In one of them," adds Sir Walter, "occurred these lines in vituperation of the adversary—

'A whig, I guess. But Rab's a tory,
And gies us mony a funny story.'

This was in 1787."

These dicta of Sir Walter Scott appear quite true. The Jacobite feeling was certainly the predominant one in the poet's earlier years, and down to about 1790; but such other political bias as he acknowledged at that time, appears to have been in favour of the ministry of Mr Pitt. He seems to have been prepossessed in favour of this statesman from the first, in consequence of his admiration of the gigantic genius of Chatham. "Will's a true gude fellow's gett [child]," he says, in his Dream for the king's birthday. Again, in his Earnest Cry and Prayer respecting the troubles of the distillers, he says, "Tell yon gude blude o' auld Boconnock's," meaning Mr Pitt, whose illustrious sire was second son to Robert Pitt of Boconnock, in the county of Cornwall. In another place the poet says, quite seriously, "A garter gie to Willie Pitt." The three last verses of the ballad on the American war form the most decisive proof of the poet's predilection for the "heaven-born minister." They are a stormy burst of triumph on his overcoming the Coalition.

"The Saxon lads, wi' loud placads,
On Chatham's boy did cry, man;
And Scotland drew her pipe, and blew,
'Up, Willie, waur them a', man,'" &c.

At the same time, it must be kept in view that the regard which the poet entertained for the minister was but in small measure extended to the existing occupant of the throne.

At the general election of 1790, the contest between Sir James Johnstone of Westerhall and Captain Miller, for the Dumfries burghs, was celebrated by Burns in three ballads, in which he evidently leans to the former candidate, who was the tory. In one of these, he makes a bitter allusion to the conduct of the whig party on the regency question. After this period, Burns began to be affected by the principles which led to the French Revolution, when, of course, as Sir Walter Scott has remarked, the government of the day sunk in his estimation.

BENNETT'S WHALING VOYAGE ROUND THE GLOBE.

THE ship Tuscan, of 300 tons burden, T. R. Stavers commander, sailed from London in October 1833, on a whaling voyage to the Pacific Ocean, having on board Mr F. D. Bennett, whose object was to investigate the anatomy and habits of southern whales, and the mode of conducting the Sperm Whale Fishery (a subject then untouched by the literature of any country), and to make as many observations on the state of the Polynesian, or other lands he might visit, and to collect as many facts and examples in natural history, as opportunities might offer. The ship had a prosperous voyage round Cape Horn and into the Pacific Ocean, where she made an extensive excursion by the Society and Sandwich Isles, to a point near Nootka Sound; thence southward to the Society Isles again, and from that point straight westward to the Indian archipelago, and so homewards, returning to Britain in November 1836, without having lost one man by disease or accident. Of this voyage we are now presented by Mr Bennett with a very agreeable narrative,* to which are added distinct sections on the southern whales and whale fishery, and on the general natural history of the countries visited. It is scarcely necessary to remark, that, in the present state of the North Sea whale fishery, a satisfactory account of the southern whales, and of the best modes of taking them, is of great importance in a commercial point of view, to say nothing of its completing a department of natural history over which, till now, much obscurity has rested.

The cachalot, or sperm whale, peculiar to the southern seas, is about sixty feet long, and is chiefly distinguished in external figure from the Greenland whale by the great bulk of its head, upon the fore part of which, external to the skull, is a huge mass of fat, sometimes producing several tons of oil. The animal is gregarious, and usually occurs in small parties, which the sailors call schools, or pods; but sometimes a number, "exceeding all reasonable conception," is assembled, and the sea for miles around appears "a succession of spouts." "A large party of cachalots, gambolling on the surface of the ocean, is one of the most curious and imposing spectacles a whaling voyage affords; the huge size and uncouth agility of the monsters exhibiting a strange combination of the grand and ridiculous. On such occasions it is not unusual to observe a whale of the largest size leap from the water with the activity of a salmon, display the entire of its gigantic frame, suspended at the height of several feet in the air, and again plunge into the sea with a helpless and tremendous fall, which causes the surrounding waters to shoot up in broad and lofty columns capped with foam; whilst others of the school leap, or 'breach,' in a less degree; sportively brandish their broad and fan-shaped flukes in the air, or protrude their heads perpendicularly above the waves like columns of black rock."

The general process of attacking the sperm whale so much resembles that of attacking the Greenland, which has been already described in this work, that we shall not present any summary of it. But there are some features of the adventure, of a peculiar nature, arising from the particular character of the animal, which may be adverted to. While the nature of the Greenland whale is of a pacific and gentle character, the cachalot has a considerable inclination to offensive warfare. If allowed time to rally after being first harpooned, he often becomes a wary and mischievous adversary. An old female and a half-grown male are considered the most troublesome to encoun

ter, from their active and combative temper. Mr Bennett considers these dangers as sufficient to counterbalance the advantage of the agreeable climate in which the southern whale fishery is pursued. He says—"Some of these whales, when attacked, will retreat but little from the spot on which they are harpooned; but rather lie, and fight with their jaws and tail until life is extinct. Others, without being themselves injured, will aid an attacked companion, and from the circumstance of their actions being less watched, often succeed in doing serious injury to the boats, whilst some few individuals make wilful, deliberate, and even judicious, attempts to crush a boat with their jaws, and, unless avoided or killed, will repeat their efforts until they succeed in their object.

An 'under clip,' or blow received from a whale's flukes near the surface of the water, may shatter and overturn a boat, or injure the crew by the force of the concussion alone; but human life is chiefly endangered when the tail of the animal is swept rapidly through the air, and either descends upon the boat, cutting it down to the water's edge, or encounters in its *trajet* some of the crew standing up, as the headsman or harpooner, who are destroyed and carried away by the blow; and this last is the most common, as well as the most sudden and awful calamity recorded in the fishery.

It was by a melancholy accident of this kind that an experienced and enterprising whaler, the father of our commander, lost his life when in command of the ship Perseverance, and outward bound on a voyage to the Pacific Ocean. He was engaged in destroying a cachalot on the Brazil Bank, when a rapid and inevitable blow from the flukes of the animal struck him out of the boat; his body floated on the water, and was immediately rescued and conveyed to the ship; but although no external marks of injury were any where visible, all attempts to restore animation were of no avail, for life was totally extinct. One of the crew, pulling an oar in the same boat, was also killed by the same blow. The whale, after thus dealing destruction amongst its pursuers, effected an escape; but there is reason to suppose, from the clue of marked harpoons left in its body, that it was subsequently destroyed by an American whale-ship.

Captain T. Stavers, of the Tuscan, when cruising in the North Pacific, during the season of 1831, had the misfortune to lose his chief mate, Mr Young, under circumstances very similar to the preceding. On the morning of the 30th of August, a small party, or 'pod,' of sperm whales was noticed from the ship, and the commander and second-mate lowered their boats in pursuit, leaving Mr Young on board in charge of the vessel. While engaged in destroying a large whale, the boat of the second-mate was so severely shattered that the consort boat was compelled to receive both the wrecked crew and the harpoon-line. The chief mate, on observing this dilemma, lowered his boat and came to their assistance. The harpooned whale was then spouting blood and much exhausted, while a loose cachalot, of equal size, remained in its vicinity, striking at the boats with his flukes, with the evident intention of assisting his wounded comrade. The boats were close together, and Captain Stavers had but just remarked to his mate, that as the whale was nearly dead, he would leave him to complete its destruction, whilst he harpooned the loose cachalot, when the tail of the latter passed, with the rapidity of lightning, over and in front of his boat, and simultaneously, Mr Young, though a large and strong man, was seen flying through the air at a considerable height, and to the distance of nearly forty yards from the boat, ere he fell into the water, where he remained floating motionless on the surface for a few moments, then sank, and was seen no more. There can be no doubt that his death was instantaneous. A native of the Society Islands plunged into the water immediately the accident occurred, and endeavoured to save the body of his unfortunate officer, but it had sunk before he could swim to the spot where it fell. No injury was sustained by any other person in the boat, nor was the boat itself injured, beyond a portion of the bow being broken off, and the thigh-board, which was torn from its place and accompanied the body of the unfortunate mate, so powerful was the impulse it had received. As is customary in cases of serious accident, the line was cut from the whale, that the boats might be at liberty to render every assistance; but when it was found that no human aid could avail in this instance, the boats renewed their attack on the harpooned whale, which was soon after killed and taken to the ship, whilst the mischievous cachalot made off, after he had been pierced with many lance-wounds. The chief mate of the British South-Seaman Lyra, when in the cruising ground off Japan in 1832, was also swept from his boat and destroyed by a blow from a whale; and similar casualties are too numerous and uniform in their results to permit a more particular notice.

Some sperm whales appear reluctant to employ their tail when attacked, but prove active and dangerous with their jaws. Such individuals often rather seek than avoid the attacking boats, and, rushing upon them with open mouth, employ every possible art to crush them with their teeth, and, if successful, will sometimes continue in the neighbourhood, biting the wreck and oars into small fragments. When thus threatening a boat, the whale usually turns and swims upon its back, and will sometimes act in a very sluggish and unaccountable manner, keeping its formidable lower jaw suspended for some moments over the boat in a threatening attitude, but ultimately rolling to one side, and closing its mouth harmlessly; nor is it rare to observe this whale, when pursued and attacked, retain its mouth in an expanded state for some minutes together. Such threatening demonstrations of the jaw, as well as some others with the flukes, occasionally compel a boat's crew to leap into the water, and support themselves by swimming or clinging to oars until the danger is past.

A highly tragical instance of the power and ferocity occasionally displayed by the sperm whale, is recorded in the fate of the American South-Seaman Essex, Captain G. Pollard. This vessel, when cruising in the Pacific Ocean, in the year 1820, was wrecked by a whale under the following extraordinary circumstances. The boats had been lowered in pursuit of a school of whales, and the ship was attending them to windward. The master and second-mate were engaged with whales they had harpooned, in the midst of the school, and the chief mate had returned on board to equip a spare boat, in lieu of his own, which had been broken and rendered unserviceable. While the crew were thus occupied, the look-out at the mast-head reported that a large whale was coming rapidly down upon the ship, and the mate hastened his task, in the hope that he might be ready in time to attack it.

The cachalot, which was of the largest size, consequently a male, and probably the guardian of the school, in the meanwhile approached the ship so closely, that although the helm was put up to avoid the contact, he struck her a severe blow, which broke off a portion of her keel. The enraged animal was then observed to retire to some distance, and again rush upon the ship with extreme velocity. His enormous head struck the starboard bow, beating in a corresponding portion of the planks, and the people on board had barely time to take to their boat, before the ship filled with water, and fell over on her side. She did not sink, however, for some hours; and the crew in the boats continued near the wreck until they had obtained a small supply of provisions, when they shaped a course for land; but here, it is to be regretted, they made a fatal error. At the time the accident happened, they were cruising on the equator, in the longitude of about 118 degrees west, with the Marquesan and Society Islands on their lee, and might have sailed in their boats to either of these groups in a comparatively short time. Under an erroneous impression, however, that all those lands were inhabited by an inhospitable race of people, they preferred pulling to windward for the coast of Peru, and in the attempt were exposed for a lengthened period to extreme privations.

The few of the crew who survived their complicated disasters first made the land at Elizabeth, or Henderson's Island, a small and uninhabited spot in the South Pacific, and which until then had never been visited by Europeans. After a short continuance here, part of the survivors again put to sea in search of inhabited land, and ultimately reached the coast of South America; when an English South-Seaman sailed from Valparaiso, and rescued those of the sufferers who had been left to support a precarious existence on Elizabeth Island. By a strange fatality, Captain Pollard, who was amongst the number of survivors, had the misfortune to lose the ship he next commanded, by running her upon a coral reef (then but little known) in the North Pacific. He returned to the United States, dispirited by his ill fortune, and, engaging in agricultural pursuits, ceased to tempt any further the perils of the deep.

A few cachalots have been noted individually as animals dangerous to attack. One was thus distinguished on the cruising ground off the coast of New Zealand, and was long known to whalers by the name of 'New Zealand Tom.' He is said to have been of great size; conspicuously distinguished by a white hump; and famous for the havoc he had made amongst the boats and gear of ships attempting his destruction. A second example, of similar celebrity, was known to whalers in the Straits of Timor. He had so often succeeded in repelling the attacks of his foes as to be considered invincible, but was at length dispatched by a whaler, who, forewarned of his combative temper, adopted the expedient of floating a cask on the sea, to withdraw his attention from the boats; but notwithstanding this *ruse*, the animal was not destroyed without much hard fighting, nor until the bow of one of the boats had been nipped off by his jaws."

The oil of the sperm whale is the purest of all the animal oils employed in commerce. In its original state, it contains a variable proportion of spermaceti and other gross matters. Of spermaceti we may only remark that, though formerly held as the most certain cure for an inward bruise, its chief use in modern times is as a substitute for wax in the manufacture of candles. The most rare and costly product of the sperm whale is *ambergris*, which is not found in any other of the whale family. Mr Bennett gives us the following account of this substance: "For many years after the civilised world became acquainted with this drug, its origin and composition remained involved in great obscurity. It was usually found floating on the seas of warm climates, and was generally considered to be of a resinous or bituminous nature: and when subsequently detected in the intestines of the cachalot, a doubt was still entertained of its true character, and whether it had not been swallowed by the animal, rather than produced within its body. Of late years, chemical investigations, and a more extended prosecution of the sperm fishery, have satisfactorily solved this problem, and determined that ambergris is a morbid concretion in the intestines of the cachalot, deriving its origin either from the stomach or biliary ducts, and allied in its nature to gall-stones, or to the bezoars of herbivorous animals; while the masses found floating on the sea, are those that have been voided by the whale, or liberated from the dead animal by the process of putrefaction.

It is not common for the whaler to find ambergris in the cachalots he destroys; nor does he, indeed, make a very rigid scrutiny of the intestines in search of it, unless a suspicion of its presence be excited by some marked peculiarity in the whale. Some years ago the whale-ship Mary, of London, discovered a dead cachalot floating on the ocean, and as there were no injuries on its body to account for death, that event was attributed to disease; consequently, the whale was strictly searched for ambergris, and the captors were gratified by finding a very large quantity of that valuable drug impacted in its bowels.

Concretions of ambergris are either black, grey, yellow, or ash-colour mottled with yellow and black. They occur of various sizes, and their maximum weight would appear to be thirty or forty pounds; but it is recorded that a mass of prodigious size, weighing 182 pounds, was carried to Ireland in the year 1694. An entire concretion, which had been recently taken from a cachalot destroyed by the South-Seaman Hoffly, and which was shown to me by her commander, when we spoke that vessel in 1835, did not exceed four ounces in weight. It was in the state as removed from the whale; of an oval form, and pointed at each extremity; of a dull-black colour; smooth on the surface; resembled soap in texture and consistence; and was similarly unctuous to the touch. Its odour was slight and peculiar, but not decidedly fragrant, unless heat was applied.

The only use made of ambergris in this country is as a perfume, and for this purpose it is chiefly prepared in the form of an alcoholic solution, or essence. It possesses a peculiar property of increasing the power of other perfumes to which it may be added, and when combined with musk, has a remarkable effect in softening the odour of that drug, and rendering it more agreeable. The retail price it bears in London is about one guinea the ounce—a value which invites to its frequent adulteration. The best tests of its purity are the oily appearance it assumes, and the odour it emits, upon the application of heat; and its perfect solubility in hot alcohol.

Some medical virtues have been attributed to this odoriferous substance, but they are all doubtful and unimportant. It is said to be tonic, aphrodisiac, and antispasmodic; it is certainly an aperient."

BIOGRAPHIC SKETCHES.

DR DENMAN.

THE amusing work entitled "Physic and Physicians," recently published, contains an autobiographical memoir of Dr Denman, extracted from his "Introduction to the Practice of Midwifery," and which gives an interesting account of the difficulties he had to meet and overcome before attaining the eminence in his profession to which his talents and high accomplishments entitled him. As this memoir seems worthy of being extensively read, we present it to our readers in the abridged form in which we find it in the new work above mentioned. It must be premised that Denman was born and educated in the country, and came to London in 1754, for further information and improvement. "'The money,' he says, 'with which I was supplied for this purpose, amounted to L.75; L.50 bequeathed by my grandfather, and L.25 as my share of what my father was supposed to be worth at the time of his death.

As I am now,' he continues, 'entering upon the details of my own life, I may be permitted to speak of myself. I had been educated at the free-school at Bakewell, in such sort of knowledge as my old master Mr Hudson was capable of teaching. I understood a little Greek, I was tolerably well informed in the Latin language, and I wrote a good hand.

I had not been instructed in any of those accomplishments which serve to show inferior capacities to advantage, nor had I seen much company, having never been from home a week at any time of my life.

It might be truly said that I was 'home-bred;' but I had an excellent constitution, having been accustomed to live on the most homely diet, and I had hardly ever been out of bed at ten o'clock at night. In short, I was a meagre, hungry, sharp-set lad. Though my education was very incomplete, I had a very competent knowledge of pharmacy, and knew as much of disease as the frequent reading of Dr Sydenham's works and a few other books could give me. I had a common understanding, and some ambition to succeed in the world, though I was ignorant of the means of procuring success; but I had been trained in habits of industry, frugality, and civility or respect to those with whom I had been connected.

Digitized by Google

When I arrived in town, I was recommended to Mr Hunt, a hairdresser in Dean Street, with whom my brother had lodged and boarded. I paid him ten shillings and sixpence a-week, and a bad bargain he had. The money I brought with me to London was intended for the purpose of enabling me to attend St George's Hospital, and two courses of anatomical lectures; but in six months it was wholly expended. I knew little of economy, for having never been accustomed to the management or disposal of money, I acted as a child in this respect, contriving how to spend it as soon as it was received. This was rather a misfortune than a fault; but it is amazing to me, when I recollect how many years I lived in the world without changing this disposition, and how many inconveniences it caused me in the course of my life. My money being gone, there was a necessity of seeking some employment for immediate support. Many were thought of, but none seemed so agreeable to myself or friends as going to sea in the king's service. I applied to the Navy Board for an order to be examined at Surgeons' Hall; and, very much to my own astonishment, I passed as surgeon to a ship of sixth rate, April 3, 1755. The ship to which I was appointed lay at Blackstairs, but I had no money to prepare for the voyage, or to bear my expenses to the ship. I pawned my watch, and set off with about forty shillings in my pocket, to enter among strangers upon a way of life of which I had no more idea than of the Mogul's court.'

After Dr Denman's return from sea, he was recommended by his friends to settle at Winchester. At this time he had saved up L.500. After residing at Winchester for some time, he says in his journal, 'I soon became impatient of waiting, and began to blame myself and others for having undertaken a matter of so much importance without more deliberation. I fretted, made myself less likely to succeed by uneasiness and solicitude, and after teasing myself and my friends for about four months, I determined to quit Winchester, having thrown away, since my arrival in England, nearly two hundred pounds.'

Dr Denman left Winchester for the great metropolis; and after attending a course of anatomical lectures and dissections, on the recommendation of Drs Kelly and Kirkpatrick he obtained his degree of M.D. from the University of Aberdeen.

Dr Denman received forty pounds in fees the first year; but this sum, he says, 'though not adequate to pay my expenses, gave me some encouragement.' He then published an essay on puerperal fever, which gained him some credit and increased his practice. He also published a letter to Dr Hirch, on the construction and use of vapour baths; but this, the author says, 'scarcely produced so much as to pay the expense of printing it.'

The doctor, finding it difficult to support himself from the proceeds of his practice, applied to be appointed surgeon to one of the king's yachts. He received the appointment, which was worth L.70 a-year to him; but in 1777 he was obliged to resign the situation, as the yacht was ordered upon service, and the attendance would have been incompatible with his London business. But to continue the doctor's autobiography:—'The whole savings,' he says, 'of the nine years I had been at sea, were now entirely expended, and I had with great difficulty kept myself out of debt; the thoughts of which hurting my pride, and giving me very mortifying reflections, I began to be very circumspect about my expenses. However, on the strength of the yacht, I had taken a small house in Oxendon Street, but I furnished only one parlour, thinking to complete it gradually, as I was able; and I hired a maid-servant, who cheated me very much. When I went into this house, excepting my furniture, I had but twenty-four shillings in the world, but I was out of debt. My business increased every year, and in the third year after I had taken my house, I had two hundred and fifty pounds, which, together with the profits for the yacht, prevented all present inconvenience, and gave me better hopes for the future.

About this time died Dr Cooper, a teacher of midwifery, of no great reputation. Mr Osborn, who had attended St George's Hospital when I did, and who was pretty much in the same predicament with respect to fortune as myself, agreed to give lectures with me. We purchased Dr Cooper's apparatus for L.120, and great difficulty we had to raise the money between us. We began to read lectures in the year 1770, awkwardly enough, and with little encouragement, as I suppose most people do at first; but it is probable that we improved, for in a short time the lectures flourished, and with them my business, and I believe my credit also.

Dr Cooper had likewise been man-midwife to the Middlesex Hospital; I offered myself as a candidate to succeed him; and after a very hard contest, some expense, and endless trouble, I was elected jointly with Dr Krohn.

I was now surgeon to the William and Mary yacht, I was teacher of midwifery, I was man-midwife to the Middlesex Hospital, I had published two pamphlets, which had at least acquired me a character for industry and common abilities, and I got upwards of L.300 a-year by my business. I was in the thirty-seventh year of my age, and I determined to marry; and becoming acquainted with the family of Mr Brodie, a respectable army linen-draper, I chose Elizabeth, his youngest daughter, then in the twenty-fourth year of her age. I received no money as a dowry, but two leasehold houses in Vine Street, Piccadilly, which produced L.80 a-year, clear of all deductions.

It was impossible to have chosen a wife more suitable to my disposition and circumstances; her manners were amiable, her disposition gentle, her understanding naturally good, and improved by reading and the conversation of reasonable people, and she had that regard for truth and propriety, that I was firmly persuaded no human consideration could induce her to depart from them. She was frugal without meanness, temperate, and cheerful; and it was impossible for any two people to have lived together with more perfect harmony than we did for nine years.

My assiduity increased with my family, so that in the very year we were married, we saved L.200, and have continued to do so every year since. About two years after our marriage, I thought it necessary to take a larger house, partly for appearance and partly for convenience, that in which we lived being too small. In the year 1772, I therefore removed into Queen Street, Golden Square, which I thought would be a good situation for lectures and for business, and I soon after purchased the lease of this house for L.1200. Three hundred pounds of this money I had saved, and for the rest I paid interest about four years, when the whole purchase was completed. I had now a large house; my business brought me in about L.400 a-year, the lectures L.100, the houses in Vine Street L.80, the yacht L.70, and I lived rent free. My business was chiefly among the lower class of people, but I never lost sight of the possibility of getting business among a higher rank; and I had struggled through so many difficulties, that my mind became seasoned against common accidents, and I was better qualified to conduct myself in the more intricate parts of the business of life. My friends have for some years given me credit for being remarkably steady; but I may assure the reader of this, whether it be my wife, or my daughters, or my son, that if I have steadiness, it is all acquired, my natural disposition being impetuous. I always thought steadiness worth every other quality, either in man or woman, and it has been the business of my life to acquire it.

About this time I took courage, and kept a chariot in the winter;* but the advantages which might result from it were rather expected than realised. My business, however, both increased and improved, though slowly; but in the year 1778 it amounted to L.600, and the profits of the lectures to L.150; and then I built a new chariot. In the year 1777, I purchased two pieces of land near Lynn, in Norfolk, for which I paid down L.350, and was to pay L.500 more. This land was to bring me in four per cent. for my money, or L.34 a-year; but I was unfortunate in my bargain, the value of money increasing immediately after I had made it; first, by the failure of Mr Fordyce the banker, which put almost an instant stop to all credit; and, secondly, by the French and American war, which occasioned a real scarcity of money.

With my new chariot I had a coachman in a handsome livery, and a servant behind, which were beyond my wish and inclination, but I thought them due to my present reputation, as well as to my future prospects; and I hoped that I had secured my family from distress, if I were to die before I had an opportunity of making any farther addition to my fortune. We observed the most strict frugality in all other respects. On February 23, 1779, I was made happy by the birth of my son, which was an unexpected blessing, as I had given up all hopes of having any more children, my daughters being at that time more than seven years of age. I shall not fail to do all in my power to provide for them, consistently with those rules of probity and integrity which I have always established as guides of my conduct, and from which, when they are capable of judging, they will be glad that I have never swerved. If the property I may leave behind me should not be so much as they expect, or as I wish, they will see the reason in this narrative. Whatever it may be, it ought to wear well, because it has been honestly gained. They will see an example of the good which attends industry and fair intentions, even when counteracted by errors and indiscretion.

The continuation of this memoir must be left to some future period, and it concludes for the present on the 5th of August 1779.'

Thus concludes the deeply interesting autobiography of Dr Denman. It appears that, after having written the above account of his early life, he found that his business did not increase as rapidly as he anticipated, and he was compelled to take pupils, three of whom attained considerable eminence in the profession, namely, Dr Parry, of Bath; Mr Chesshen, of Hinckley; and Philip Martineau, Esq., of Norwich.

In 1781, his house was burned down, which involved him in considerable pecuniary difficulties. On the death of Dr Hunter, Denman rose rapidly in practice, and was placed at the head of his profession. Upon removing his residence to Old Burlington Street, he was called to attend the late Duchess of Devonshire—a circumstance particularly gratifying to him, as, from the impression of his early life, he always felt strongly attached to that noble family.

Dr Denman now finding the duties of his profession too laborious for him, he gradually introduced his son-in-law, Mr Croft, who had chosen the same branch of the profession, and who attended to the more arduous duties of the practice, until the doctor finally retired from the field. Dr Denman died in the year 1815."

*[The keeping of a carriage is indispensable to success in the practice of London physicians. No man who walks on foot is supposed to possess any ability.—Ed.]

CONTRABAND MUSEUM IN PARIS.

I had caught a bad cold, and just as I lifted up my head to sneeze, I saw through one of the windows of the mayor's office, in the twelfth *arrondissement*, the body of a negro hanging by the neck. At the first glance, and even at the second, I took it for a human being whom disappointed love, or perhaps an expeditious justice, had disposed of so suddenly; but I soon ascertained that the ebony gentleman in question was only a kind of doll as large as life. What to think of this I did not know; so I asked the doorkeeper the meaning of it.

"This is the contraband museum," was the answer; and, on my showing a curiosity to examine it, he was kind enough to act as my *cicerone*.

In a huge dusty room are scattered over the floor, on the walls, and along the ceiling, all the inventions of roguery which have been confiscated from time to time by those guardians of the law, the revenue officers. It is a complete arsenal of the weapons of smuggling: all unfortunately in complete confusion. Look before you; there is a hogshead dressed up as a nurse, with a child that holds just two quarts and a half. On the other side are logs, hollow as the Trojan horse, and filled with whole armies of cigars. On the floor lies a huge boa constrictor, gorged with China silks; and just beyond it a pile of coal, curiously perforated with spools of cotton. The coloured gentleman who had excited my sympathy so much at first, met with his fate under the following circumstances:—He was built of tin, painted black, and stood like a heyduck or Ethiopian *chasseur*, on the footboard of a carriage, fastened by the feet and hands. He had frequently passed through the gates, and was well known by sight to the soldiers, who noticed that he was always showing his teeth, which they supposed to be the custom of his country. One day the carriage he belonged to was stopped by a crowd at the gate. There was, as usual, a grand chorus of oaths and yells, the vocal part being performed by the drivers and cartmen, and the instrumental by their whips. The negro, however, never spoke a word. His good behaviour delighted the soldiers, who held him up as an example to the crowd. "Look at the black fellow," they cried; "see how well *he* behaves! Bravo, nigger, bravo!" He showed a perfect indifference to their applause. "My friend," said a clerk at the barrier, jumping up on the footboard, and slapping our sable friend on the shoulder, "we are really very much obliged to you!" Oh, surprise! the shoulders rattled. The officer was bewildered: he sounded the footman all over, and found he was a man of metal, and as full as his skin would hold of the very best contraband liquor. The juicy mortal was seized at once, and carried off in triumph. The first night the revenue people drank up one of his shoulders, and he was soon bled to death. It is now six years since he lost all the moisture in his system, and was reduced to a dry skeleton.

How many strange stories these inventions of roguery might tell! Only ask that empty mattrass that lies there by the stove. That mattrass came from Valenciennes. One morning, two citizens left the town, with swords in hand, and seconds by their side. The solemn mournful gait of their companions indicated clearly the deadly character of the promenade, which took place before the eyes of the revenue officers. The angry principals were so anxious to get to work, that they drew almost as soon as they were beyond the walls. The crossing of their blades, and the clatter of the duel, would easily be noticed from the guard-house. After a desperate contest, the noise ceased. A cry of distress was heard; and if both the contending parties had preserved their honour untouched, the person of one of them could not boast of the same immunity. A wide wound across the forehead, and a scientific thrust into the region of the sternum, which bled profusely, were easily seen. In a moment, a hand-barrow, with the aforesaid mattrass upon it, were transformed into a litter, and the procession re-entered the town by the same gate, amidst the sympathies of the guards.

It happened that one of the soldiers had dabbled a little in medicine, and been surgeon's mate in a regiment. He took pity on the wounded man, and followed him home, to offer him his services. This generous behaviour won him all hearts in Valenciennes, except those of the seconds, who were at a loss how to get rid of a benefactor whose presence would be so fatal to the success of their daring fraud. At last, the most ingenious of them took the soldier aside, and begged him to wait a few moments in another room, till he got the sick man ready to receive his disinterested physician. The surgeon-soldier readily agreed to this; the friend availed himself of the interval, and whispered in the patient's ear, as he lay on the mattrass, "We are lost!"

"*Sabrebleu!* and why?" asked the wounded man.

"Speak lower! one of the custom-house guards wants to dress your wounds."

"My wounds? he shant do it—I want to keep them as they are, and you go and tell him so."

"He wont believe it," was the answer.

"But suppose I dont want to be cured? I presume I am my own master, and besides, I have a reason for it."

"I know that, but the fool will insist on it."

"He may go to the d—l; I'll jump out of the window first."

"Why, you wretch, we shall be ruined."

"What of it? I wish I had really been badly wounded, I give you my word for it."

"Alas! I'm afraid it's the only way to get out of this scrape."

Digitized by Google

"Much obliged to you."

"If you only would" ——

"Well, what?"

"It's time enough yet, perhaps" ——

"Well?"

"The wife of Brutus, on a like occasion, inflicted a desperate wound on herself."

"What have I get to do with that?"

"Don't you understand, my dear friend?"

"Ah, horrible! I shudder at the thought. You are so fond of me, that you are very willing to shed *my* blood"—and the frightened patient raised himself up in bed.

"Come, come, try to be reasonable."

"You are troublesome: do you think I'm going to throw away my life to serve you—think of something else. I should like very much to oblige you—but in such a way—never! I'd die first."

"Only think what it is you object to—only two little wounds—if they only look natural, it's all sufficient. Come, my dear fellow, say you agree to it."

"I tell you again and again, I wont."

"Come, now, be clever, I've an easy hand; and the surgeon will be tired waiting."

"I suppose you think it will be fine fun for me."

"Oh what a fuss you make about a couple of little scratches! If kindness and friendship cannot touch your obstinate heart, let's see what force will do." And thereupon the friend seized his sword; the patient dodged the first blow, leaped to his feet, snatched up the other weapon, and attacked his aggressor furiously. The soldier, hearing the scuffle, rushed into the room, and succeeded, not without trouble, in separating the combatants, when he found, to his great surprise, that it was not the sham patient that needed help, but his friend, till now safe and sound, whom the dying man had pinked just below the thorax.

"I thought," said the soldier, "that these gentlemen were too polite to give me all the trouble of coming for nothing."

The wounded man was soon cured, and the mattrass, stuffed full of English goods, well repaid the soldier for his medical services.—*From the French, in the New York Mirror.*

ALCOHOL.

Alcohol was so denominated, by an Arabian physician who discovered it, from a fine impalpable powder with which the ladies of Barbary were accustomed to tinge the hair and edges of the eyelids—the word being thus anatomised: *Al*, the, and *Kahol*, powder of lead ore.

There is a prevalent notion, which has been of some use in resistance to the maxims of temperance, that, alcohol being a direct product of nature, it ought to be esteemed as a gift of Providence, and received and enjoyed as such. We find this view controverted in a work recently published under the title of "Bacchus, being an Essay on the Nature, Causes, Effects, and Cure of Intemperance," by Mr Grindrod of Manchester. It is there represented that alcohol is a thing of considerably different character, and that of course all such arguments for its use as an intoxicating fluid must fall to the ground.

When vegetables cease to live, they, like animals under the same circumstances, hasten to a complete dissolution or decomposition, so as to become once more inorganic matter. Very soon after they have ceased to live, if steeped in water, at a temperature o about 60 degrees of Fahrenheit, they begin to undergo a process called *fermentation*. Of this process there are three stages, each, however, only to be realised under certain conditions. For the first, or *vinous* stage, the above temperature is necessary; for the second, the *acetous* stage, a temperature of 70 degrees is required; the third, or *putrefactive* stage, has also conditions peculiar to itself.

The first stage in fermentation is named the *vinous*, because at that stage is developed the spirit of wine, or alcohol. The second is named *acetous*, because in like manner vinegar is then produced. It is by arresting the process at these respective stages, and subjecting the fermenting matter to distillation, that human ingenuity obtains alcohol and vinegar, neither of which is ever found, in any form or combination whatever, as the effect of any living process, but only as arising "out of the decay, the dissolution, and the wreck, of organised matter." The constituent elements of alcohol are, nevertheless, the same as those of all living vegetable substances, namely, *carbon*, *hydrogen*, and *oxygen*; the first being, out of 100 parts, as 52, the second as 13, and the third as 35. These statements will serve to introduce the following remarks of Mr Grindrod:—

"On the supposition that the formation of alcohol is the result of natural laws, it may pertinently be inquired, why man interferes with and disturbs the operations of nature, at a particular period, that is, exactly at the commencement of her object, and thus prevents that ultimate action which otherwise would inevitably take place. The answer is simple and decisive. He arrests the operations of nature exactly at that period when he can supply himself with a product calculated to gratify his depraved and vitiated appetites. Hence the multifarious and complicated inventions of the wine-maker and brewer.

This branch of our inquiry may be better understood by a slight review of the active laws of animate vegetable creation, so far at least as they have connexion with the present object of our investigation. The constituent principles of vegetables consist of carbon, oxygen, and hydrogen. The poisonous upas, and the nutritious grape; the fragrant rose, and the nauseous assafœtida; the refreshing foliage, and the delicate tints of the vast arcana of vegetable nature, each owes its peculiar quality to these simple substances. So wonderful, indeed, is the laboratory of nature, that even from the same trunk, and from a mass of sap, apparently homogeneous in its character, substances of a very opposite nature are produced. An oil, bland as that of the olive, is eliminated from the poppy. In some parts of the globe it is extensively employed for dietetic purposes. From the same plant is extracted the milky juice, from whose substance is produced the poisonous opium. The delicious pulp of the peach also is well known to enclose in its kernel a poison of a most deadly character. Olive oil is another instance in point. Its chemical constituents approach near to those of alcohol; how materially, however, do these substances differ in their operation on the human system! These facts are sufficient to convince us how profound, and yet how simple, are the operations of creation, and how boundless she is in her resources to supply the wants and to gratify the lawful pleasures of man.

The knowledge that the whole of this variety in vegetable creation is occasioned simply by a very slight variation in the combination of three simple substances, affords to us a distinct idea how the elementary principles of alcohol may exist in nature, without the actual existence of alcohol itself. No human investigation has as yet, nor indeed have we any reason to suppose it ever will, discover the slightest trace of native alcohol in any part of the creation of nature.

The application of this argument is familiar and clear. Many persons assert that alcohol is contained in grain and fruit, and in every part of vegetable creation, and that therefore it is intended by the Creator for the use of man. Such, however, is not the case. The elements of alcohol, indeed, are to be found throughout the whole of vegetable creation, and so are the elements of other deleterious substances, but not a particle of alcohol itself. So long as the chemistry of life retains its sway, will the constituent materials of vegetable matter hold together in the relation in which nature has placed them. Death, however, or, in other words, decomposition, subverts this natural arrangement, dissolves its connexions, and new and totally different combinations are thereby formed. So it is with alcohol. In wines, this poison undergoes evolution during the decay or decomposition of the juice of the grape; in malt liquors, man destroys the vital principle of the barley, by converting it into malt, and then subjects it to another artificial process, which produces results similar to those which take place in the production of wine.

By many it has been supposed that alcohol does not exist ready formed in fermented liquors, but that it is generated by the heat used in the process of distillation. The fallacy, however, of this view, is manifest from several considerations, and by none more than by the following decisive experiment made by Mr Brande, and subsequently confirmed by other distinguished philosophers. Add to wine a solution of the subacetate of lead, and the colouring and extractive matter will be precipitated. The further addition of a small portion of dry subcarbonate of potassa, separates the alcohol from the fluid, which floats on the surface, and will ignite on coming in contact with a lighted taper. By this means we decisively determine that distillation separates merely the alcohol, which had been previously evolved by the process of fermentation; its constituent parts being thereby extracted, in their elementary forms, from the saccharine juices of the grain or fruit, and combined under a new, a potent, and a deleterious form.

Arguments like these are interesting, and even necessary to remove such objections as are urged in proof that alcohol is a 'good creature of God.' The great point, however, to be ascertained, is, the effect of these liquors on the moral and physical powers of man. Let it be admitted, for the sake of argument, that alcohol is a creature of God, and no advantage will be derived by its advocates from the concession. Many of our most powerful poisons are the creatures of God. The poisonous upas, and the deadly hemlock, are each of them creatures of God; yet the Creator nowhere authorises his creatures to make use of them as habitual articles of diet. He has given to man the power of distinguishing between moral good and evil; and although the scientific knowledge of the precise character and quality of articles generally used for dietetic purposes may be limited in a great measure to professional men, yet it is every man's duty, as it is obviously his interest, to acquire by experience all the knowledge he can upon that important subject; and conscientiously to abstain from every indulgence which is calculated either to affect his moral character, or to injure the exquisite texture of his intellectual or corporeal frame."

We leave this train of reasoning to the best consideration of our readers, without pretending to pronounce decisively on a point which involves the whole question of providential design.

SURPRISING OF MILITARY POSTS.

About the same time, one of Hill's posts near the confluence of the Aron with the Adour, was surprised by some French companies, who remained in advance until fresh troops detached from Urt forced them to repass the river again. This affair was a retaliation for the surprise of a French post a few days before, by the sixth division, which was attended with some circumstances repugnant to the friendly habits long established between the French and British troops at the outposts. The value of such a generous intercourse old soldiers well understand, and some illustrations of it at this period may be quoted. On the 9th of December, the 43d were assembled in column on an open space, within twenty yards of the enemy's out-sentry; yet the latter continued to walk his beat for an hour without concert, relying so confidently on the customary system, that he placed his knapsack on the ground to ease his shoulders. When at last the order to advance was given, one of the British soldiers, stepping out, told him to go away, and helped him to replace his pack; the firing then commenced. The next morning the French, in like manner, warned a 43d sentry to retire. But the most remarkable instance happened on the occasion of Lord Wellington being desirous of getting to the top of a hill occupied by the enemy near Bayonne. He ordered the riflemen who escorted him to drive the French away, and seeing the former stealing up, as he thought, too near, called out to commence firing; with a loud voice one of those old soldiers replied, "No firing!" and then, holding up the butt of his rifle towards the French, tapped it in a peculiar way. At the well-understood signal, which meant, "We must have the hill for a short time," the French, who, though they could not maintain, would not have relinquished the post without a fight if they had been fired upon, quietly retired. And this signal would never have been made if the post had been one capable of a permanent defence, so well do veterans understand war and its proprieties.—*Napier's Peninsular War.*

ANECDOTE OF ACHILLE MURAT.

[The following curious anecdote is translated in the New York Mirror, from the *Courrier des Etats-Unis*, a French periodical which has been published for several years in the same city, and is now under the care of a gentleman named Gaillardet.]

We may mention the name of a prince as having been, for a time at least, connected with the New Orleans bar. M. Achille Murat, son of the ex-king of Naples, made his *début* as an advocate there, and showed himself a remarkable man, if not an orator. With a singularity, however, which belongs to his character, he never appeared at the bar a second time, and has since quitted the gown and the country. We may, however, mention an anecdote of his stay here, which rests on the authority of his mother, the Princess of Lipona.

While Italy was a province of the empire, a mutiny broke out in the garrison of Leghorn, of so serious a character as to excite in a high degree Napoleon's indignation. He was no friend of insubordination, and resolved to crush it in its bud, and make a terrible example of the culprits. Joachim Murat was charged with this painful duty, and set off for Leghorn without delay. When he arrived there, the insurrection had spent itself, and shame and remorse succeeded a temporary forgetfulness. However, the emperor's orders were strict, and punishment must be inflicted. Murat therefore called the soldiers together, and, after reproaching them bitterly for their offence, required that the ringleaders of the mutiny should be given up, otherwise ten men out of every battalion would be drawn by lot, and shot. The soldiers hung their heads, and professed themselves ready to submit to any punishment their emperor might inflict upon them, but begged the general not to force them to turn informers against their comrades. Murat would not yield, and the ten men, whose names were drawn, were about to be carried off, when three soldiers stepped to the front, and avowed themselves the instigators of the revolt. There was so much shame and contrition expressed by the *sieur moustaches*, that Murat was deeply moved. He stood silent a while, then ordered the three criminals to be taken to prison, to be shot the next morning. That same night, when every thing was quiet, except the measured step of the patrol, and the cry of the sentinels on the walls, Murat was seated in his apartment, while before him stood three grizzled veterans, cap in hand, weeping like children. It was not death that the heroes of Arcole and Marengo feared—it was to be disgraced to die the death of traitors; they wept, not for their fate, but for their crime!

"Listen!" said Murat. "I believe you are really sorry for what you have done, and I want to save your lives. To-morrow, at daybreak, you will be led out to execution, outside the city. I will take care there shall be no spectators. The platoon will fire on you with blank cartridges, and you must fall down, and remain motionless, till they march off the ground. A trusty man will be ready to put you into a close carriage; a vessel sails to-morrow for America, on board of which you will embark. Here is a purse of gold for each of you. Will you promise to behave yourselves?"

Every thing happened as he had arranged it; and Napoleon thanked Murat for having taken the lives of only three of his soldiers. The circumstances remained a secret till 1830, when Prince Achille Murat, walking one day in the suburbs of New Orleans, was caught in a shower. He sought shelter in the nearest house, a small and plain one; a man and wife, with their children, were the only inhabitants. The man had an austere, yet good-natured face, and that stiffish walk which an old soldier can never get rid of. The prince remarked that his host eyed him fixedly, and seemed strangely agitated. The prince, on the other hand, sitting by the humble hearth, cast his eyes round the room with the idle curiosity of a man who has nothing to do. He rose, for he saw on the walls some coarse engravings of Napoleon's generals and battles. Above them were placed, under a laurel crown, two portraits of Murat, as general, and as king. "Have you ever served France?" asked the prince. "Yes, sir," answered his host, not without embarrassment. "Where? and under whom?" "In Italy, under General Murat." The son of the soldier-king held out his hand to his father's old comrade. "Your name, my brave fellow?" "Claude Gérard; might I ask, sir, ——" "I am Achille Murat." "It is true, then, and my eyes did not deceive me! You are the son of my general, of my king, of my saviour! If I am now alive, if I have a wife and children, I owe it to him, and to

Digitized by Google

him alone;" and thereupon the old soldier told the story we have sketched down, often interrupting it with blessings and exclamations of gratitude.

The prince, whose singular character, and aversion to society, led him to avoid the city, and wander about in the country, never, while he remained in America, found any roof more welcome, and visited none oftener, than that which covered the poor and humble abode of his father's old companion in arms.

HUMOURS OF AN IRISH STUDENT.

Among the many peculiar tastes which distinguished Mr Francis Webber, was an extraordinary fancy for street begging; he had, over and over, won large sums upon his success in that difficult walk; and so perfect were his disguises, both of dress, voice, and manner, that he actually, at one time, succeeded in obtaining charity from his very opponent in the wager. He wrote ballads with the greatest facility, and sung them with infinite pathos and humour; and the old woman at the corner of College Green was certain of an audience, when the severity of the night would leave all other minstrelsy deserted. As these feats of *jonglerie* usually terminated in a row, it was a most amusing part of the transaction to see the singer's part taken by the mob against the college men, who, growing impatient to carry him off to supper somewhere, would invariably be obliged to have a fight for the booty.

Now, it chanced that a few evenings before, Mr Webber was returning with a pocket well lined with copper, from a musical *réunion* he had held at the corner of York Street, when the idea struck him to stop at the end of Grafton Street, where a huge stone grating at that time exhibited, perhaps it exhibits still, the descent to one of the great main sewers of the city.

The light was shining brightly from a pastry-cook's shop, and showed the large bars of stone, between which the muddy water was rushing rapidly down, and plashing in the torrent that ran boisterously several feet beneath.

To stop in the street of any crowded city is, under any circumstances, an invitation to others to do likewise, which is rarely unaccepted; but, when in addition to this, you stand fixedly in one spot, and regard with stern intensity any object near you, the chances are ten to one that you have several companions in your curiosity before a minute expires.

Now, Webber, who had at first stood still, without any particular thought in view, no sooner perceived that he was joined by others, than the idea of making something out of it immediately occurred to him.

"What is it, agra?" inquired an old woman, very much in his own style of dress, pulling at the hood of his cloak.

"And can't you see for yourself, darlin'?" replied he sharply, as he knelt down, and looked most intensely at the sewer.

"Are ye long there, avick?" inquired he of an imaginary individual below; and then waiting as if for a reply, said, "Two hours!" "Blessed Virgin! he's two hours in the drain!"

By this time the crowd had reached entirely across the street, and the crushing and squeezing, to get near the important spot, was awful.

"Where did he come from?" "Who is he?" "How did he get there?" were the questions on every side, and various surmises were afloat, till Webber, rising from his knees, said, in a mysterious whisper to those nearest him, "He's made his escape to-night out o' Newgate by the big drain, and lost his way; he was looking for the Liffey, and took the wrong turn."

To an Irish mob, what appeal could equal this? A culprit, at any time, has his claim upon their sympathy; but let him be caught in the very act of cheating the authorities, and evading the law, and his popularity knows no bounds. Webber knew this well; and, as the mob thickened around him, sustained an imaginary conversation that Savage Landor might have envied, imparting now and then such hints concerning the runaway, as raised their interest to the highest pitch, and fifty different versions were related on all sides—of the crime he was guilty—the sentence passed on him—and the day he was to suffer.

"Do ye see the light, dear," said Webber, as some ingeniously benevolent individual had lowered down a candle with a string; "do ye see the light; oh! he's fainted, the creature." A cry of horror from the crowd burst forth at these words, followed by an universal shout of "Break open the street."

Pick-axes, shovels, spades, and crow-bars, seemed absolutely the walking accompaniments of the crowd, so suddenly did they appear upon the field of action, and the work of exhumation was begun with a vigour that speedily covered nearly half of the street with mud and paving stones; parties relieved each other at the task, and, ere half an hour, a hole capable of containing a mail-coach, was yawning in one of the most frequented thoroughfares of Dublin. Meanwhile, as no appearance of the culprit could be had, dreadful conjectures as to his fate began to gain ground. By this time the authorities had received intimation of what was going forward, and attempted to disperse the crowd; but Webber, who still continued to conduct the prosecution, called on them to resist the police, and save the poor creature. And now began a most terrific fray; the stones forming a ready weapon, were hurled at the unprepared constables, who, on their side, fought manfully, but against superior numbers; so that, at last, it was only by the aid of a military force the mob could be dispersed, and a riot, which had assumed a very serious character, got under. Meanwhile, Webber had reached his chambers, and changed his costume, and was relating over a supper table the narrative of his philanthropy to a very admiring circle of his friends.—*Charles O'Malley, the Irish Dragoon.*

GREAT EVENTS FROM TRIFLING CAUSES.

There is a tradition in Scotland, that a dram of brandy produced the restoration of Charles II. A messenger from the Parliament of England had brought letters to General Monk whilst he remained in Edinburgh. This messenger was also intrusted with dispatches to the governor of Edinburgh Castle, a circumstance which he mentioned to one of Monk's servants while on his journey. The man (a sergeant) saw something unusual in this, and prevailed upon his fellow-traveller to drink a dram of brandy with him at a neighbouring ale-house, where the messenger became ultimately so drunk that the sergeant was enabled to take the papers from his custody without detection. This done, he posted to his general with the packet, who, on perusing its contents, found an order for his arrest and detention in the castle. Policy and resentment at once directed the eyes of Monk to Charles Stuart, and his restoration succeeded.

THE EGGS AND THE HORSES.

[The following version of a popular English story, of which an outline is given in Grose's Dictionary, was one of the "speeches" at St Saviour's Grammar School in November 1837. The youthful author has already given to the world an attractive volume of versified fables, under the title of "Old Friends in a New Dress."*]

John Dobbins was so captivated
By Mary Trueman's fortune, face, and cap,
(With near two thousand pounds the hook was baited)
That in he popp'd to matrimony's trap.

One small ingredient towards happiness,
It seems, ne'er occupied a single thought;
For his accomplish'd bride
Appearing well supplied
With the three charms of riches, beauty, dress,
He did not, as he ought,
Think of ought else; so no inquiry made he
As to the temper of the lady.

And here was certainly a great omission;
None should accept of Hymen's gentle fetter,
"For worse or better,"
Whatever be their prospect or condition,
Without acquaintance with each other's nature;
For many a mild and quiet creature
Of charming disposition,
Alas! by thoughtless marriage has destroy'd it.
So, take advice; let girls dress e'er so tastely,
Don't enter into wedlock hastily
Unless you can't avoid it.

Week follow'd week, and, it must be confest,
The bridegroom and the bride had both been blest:
Month after month had languidly transpired,
Both parties became tired:
Year after year dragg'd on;
Their happiness was gone.

Ah! foolish pair!
"Bear and forbear"
Should be the rule for married folks to take.
But blind mankind (poor discontented elves!)
Too often make
The misery of themselves.

At length the husband said, "This will not do!
Mary, I never will be ruled by you:
So, wife, d'ye see?
To live together as we can't agree,
Suppose we part!"
With woman's pride,
Mary replied
With all my heart!"

John Dobbins then to Mary's father goes,
And gives the list of his imagined woes.
"Dear son-in-law!" the father said, "I see
All is quite true that you've been telling me;
Yet there in marriage is such strange fatality,
That when as much of life
You will have seen
As it has been
My lot to see—I think you'll own your wife
As good or better than the generality.

An interest in your case I really take,
And therefore gladly this agreement make:
An hundred eggs within this basket lie,
With which your luck, to-morrow, you shall try;
Also my five best horses, with my cart;
And from the farm at dawn you shall depart.
All round the country go,
And be particular, I beg;
Where husbands rule—a horse bestow,
But where the wives—an egg.
And if the horses go before the eggs,
I'll ease you of your wife—I will—I fegs!"

Away the married man departed,
Brisk and light-hearted:
Not doubting that, of course,
The first five houses each would take a horse.
At the first house he knock'd,
He felt a little shock'd,
To hear a female voice, with angry roar,
Scream out—"Hullo!
Who's there below?
Why, husband, are you deaf? go to the door,
See who it is, I beg."
Our poor friend John
Trudged quickly on,
But first laid at the door an egg.

I will not, all his journey through,
The discontented traveller pursue;
Suffice it here to say
That when his first day's task was nearly done,
He'd seen an hundred husbands, minus one,
And eggs just ninety-nine had given away.
"Ha! there's a house where he I seek must dwell,"
At length cried John; "I'll go and ring the bell."

The servant came—John ask'd him, "Pray,
Friend, is your master in the way?"
"No," said the man, with smiling phiz,
"My master is not, but my mistress is;
Walk in that parlour, sir, my lady's in it;
Master will be himself there—in a minute."
The lady said her husband then was dressing,
And, if his business was not very pressing,
She would prefer that he should wait until
His toilet was completed;
Adding, "Pray, sir, be seated."
"Madam, I will."
Said John, with great politeness; "but I own
That you alone
Can tell me all I wish to know;
Will you do so?
Pardon my rudeness,
And just have the goodness
(A wager to decide) to tell me—do—
Who governs in this house—your spouse, or you?"
"Sir," said the lady, with a doubting nod,
"Your question's very odd:
But as, I think, none ought to be
Ashamed to do their duty (do you see?)
On that account I scruple not to say
It always is my pleasure to obey.
But here's my husband (always sad without me);
Take not my word, but ask him, if you doubt me."
"Sir," said the husband, "'tis most true;
I promise you,
A more obedient, kind, and gentle woman
Does not exist."
"Give us your fist,"
Said John, "and, as the case is something more than common,
Allow me to present you with a beast
Worth fifty guineas at the very least.
There's Smiler, sir, a beauty, you must own,
There's Prince, that handsome black,
Ball the grey mare, and Saladin the roan,
Besides old Dunn;
Come, sir, choose one;
But take advice from me,
Let Prince be he;
Why, sir, you'll look the hero on his back."
"I'll take the black, and thank you too."
"Nay, husband, that will never do;
You know, you've often heard me say
How much I long to have a grey;
And this one will exactly do for me."
"No, no," said he,
"Friend, take the four others back,
And only leave the black."
"Nay, husband, I declare
I must have the grey mare."
Adding (with gentle force)
"The grey mare is, I'm sure, the better horse."
"Well, if it must be so—good sir,
The grey mare we prefer:
So we accept your gift." John made a leg;
"Allow me to present you with an egg;
'Tis my last egg remaining
The cause of my regaining,
I trust, the fond affection of my wife,
Whom I will love the better all my life.
Home to content has her kind father brought me;
I thank him for the lesson he has taught me."

LORD ERSKINE'S LOVE OF ANIMALS.

"I dined to-day [a day in January 1808] at Lord Erskine's. It was what might be called a great opposition dinner. * * Among the light and trifling topics of conversation after dinner, it may be worth while to mention one, as it strongly characterises Lord Erskine. He has always expressed and felt a great sympathy for animals. He has talked for years of a bill he was to bring into parliament, to prevent cruelty towards them. He has always had several favourite animals to which he has been much attached, and of which all his acquaintance have a number of anecdotes to relate—a favourite dog, which he used to bring when he was at the bar, to all his consultations; another favourite dog, which, at the time when he was Lord Chancellor, he himself rescued in the street from some boys who were about to kill it, under pretence of its being mad; a favourite goose, which followed him wherever he walked about his grounds; a favourite macaw, and other dumb favourites without number. He told us now that he had got two favourite leeches. He had been blooded by them last autumn, when he had been taken dangerously ill at Portsmouth; they had saved his life, and he had brought them with him to town; had ever since kept them in a glass; had himself every day given them fresh water; and had formed a friendship with them. He said he was sure they both knew him, and were grateful to him. He had given them different names, Home and Cline (the names of two celebrated surgeons), their dispositions being quite different. After a good deal of conversation about them, he went himself, brought them out of his library, and placed them in their glass upon the table. It is impossible, however, without the vivacity, the tones, the details, and the gestures of Lord Erskine, to give an adequate idea of this singular scene."—*Sir Sam. Romilly's Memoirs.*

OLIVER CROMWELL.

His speech on dissolving parliament, April 20, 1653, is a burst of extraordinary eloquence:—"It is high time for me to put an end to your sitting in this place, which you have dishonoured by your contempt of all virtue, and defiled by your practice of every vice. You are a factious crew, and enemies to all good government. Ye are a pack of mercenary wretches, and would, like Esau, sell your country for a mess of pottage, and, like Judas, betray your God for a few pieces of money. Is there a single virtue now remaining amongst you? Is there one vice that you do not possess? You have no more religion than my horse: gold is your god. Which of you has not bartered away your conscience for bribes? Is there a man amongst you that has the least care for the good of the Commonwealth? Ye sordid profligates! have ye not defiled this sacred place, and turned the Lord's temple into a den of thieves, by your immoral principles and wicked practices? You, who were deputed here by the people to get grievances redressed, are yourselves become the greatest grievance. Your country, therefore, calls upon me to cleanse this Augean stable, by putting a final period to your iniquitous proceedings in this house: and which, by God's help and the strength he has given, I am now come to do. I command you, therefore, upon the peril of your lives, to depart immediately out of this place. Go! get ye out; make haste. Ye venal slaves, begone! So! take away that shining bauble (the mace) there, and look up the doors."

London: Published, with permission of the proprietors, by W. & R. Chambers, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

A FEW WEEKS FROM HOME.

THE RAILWAYS.

WHEN a person, in travelling southwards, reaches the neighbourhood of Newcastle, he finds himself suddenly transported into the region of railways, in which not only a new kind of locomotion, but a new order of things generally, may be said to prevail. A railway region is a very different thing from a district of country still lying in its primitive simplicity of common roads and common means of transport. The change from the one condition of things to the other is very striking, and is attended with both ludicrous and melancholy effects. As I performed a journey of several hundred miles by railways in different directions, I beg to offer a few words on this rather interesting matter.

At present, England is in the course of being cut, bored, bridged, and banked, in nearly all directions by prospective railways, so that in a few years we shall be able to make excursions to the most remote quarters of the country with the greatest ease and expedition. Already I have spoken of the railway across the island from Carlisle, and this is the first which we stumble upon in going south. Adjacent to Newcastle there are several lines in operation, among which are one to Tynemouth, one to Sunderland, and a third which connects the Sunderland line with Durham. All these are, comparatively speaking, short railways. A line of grander character, called the North of England, is at present constructing from York northwards, and is designed to reach Newcastle; in a short time it will be opened as far as Darlington or Durham, and then, by means of the above-mentioned short railways, there will be an unbroken line of rails betwixt York and the Tyne. In travelling by coach southwards, we at different places see the line in active progress. Reaching York, a new railway awaits us, called the North Midland, which extends from that city to Derby, and is already opened at both ends, leaving about twenty miles in the centre in a state of forwardness. Proceeding by this line, and having arrived at Derby, we are next carried forward by the Birmingham and Derby Junction to a point on the London and Birmingham line, at a place called Hampton, and are thence sent directly onwards to London. We have, therefore, already, by these different lines, which, as may be supposed, are the property of different companies, an almost complete railroad from York to London, and soon another hundred miles will be added as far north as Newcastle, which, from certain ill-judged contentions of competing companies, must remain the limit in this direction for a number of years. Little doubt can be entertained that ultimately there will be a line from Newcastle to Edinburgh, either by the coast or through the interior; but before this, a railway from England will most likely have reached the west of Scotland.

In this rapid view of matters in the eastern and middle part of the country, I have only mentioned the great line, or, as it may be styled, one of the main arteries of the railway system; it remains to be told that the principal thoroughfare receives branches, or pushes forth extensions, at different places in its course, not the least important being a cross branch from Manchester to Sheffield, not yet finished; a short branch in extension of this from Sheffield, now in operation, and bringing hundreds of passengers to the Derby Junction daily, the point of influx being at Rotherham; and a branch from Nottingham, which strikes the line at Derby. The North Midland, likewise, is extended to Leeds; and when this portion is opened, as well as the above side branches, a prodigious increase will take place in the traffic by this great line of route.* The towns either actually upon the line or within a very short distance from it, are Leeds, Wakefield, Barnsley, Rotherham, Sheffield, Chesterfield, Belper, and Derby; and at the distance of a few miles are also the towns of Pontefract, Doncaster, Bawtry, Worksop, Mansfield, Bakewell, Matlock, Wirksworth, and Ashbourne. The North Midland Railway performs the important office of connecting the populous and wealthy districts employed in the woollen, the linen, and the cutlery manufactures of Yorkshire, and the hosiery, lace, and porcelain manufactures of Derby; and also, by means of the other railways joining it, will connect with the hardware manufactures of Birmingham, the hosiery and lace manufactures of Nottingham and Leicester, and the wool-growing districts of Leicestershire, Northamptonshire, and Warwickshire—all which places will have the most rapid and easy communication with London and the south and west of England. The entire length of the North Midland Railway from Leeds to Derby is seventy-two and a half miles.

So much for the eastern and midland division of the north of England. As is well known, the line from London to Birmingham, and the Grand Junction extended from it to Manchester, have been some time in effective operation, and these, with the railway from Manchester to Liverpool, may be called old-established concerns. Latterly, the Grand Junction, which strikes the Manchester and Liverpool at Warrington, has been extended by the addition of the North Union to Preston, passing Wigan in its course; and in a few months a new line will in addition be opened as far as Lancaster. Till the present time, the chief communication from the north with London takes place through this commodious channel. Reaching Preston by coach, the traveller is fairly embarked on the railway trains, and in ten hours reaches the metropolis, whence he may be transferred by other railways to different parts of the country.

It has been projected to carry a line of railroad from London to Cambridge, and so on in a straight course by Lincoln to York, where it will join the North of England, and thus form a distinct and great artery of communication northwards. But there is little chance of this being speedily performed, and, for a number of years to come, the entire transit from the metropolis in a northerly direction will be first by the London and Birmingham, and then by its two great tributaries—one from Derby, York, and Newcastle, and the other from Manchester, Preston, and Lancaster. This last mentioned will finally bring up the great bulk of the Scotch traffic from Dumfries, Paisley, Glasgow, and other western parts of the kingdom; and when this consummation is effected, the transit along the London and Birmingham, terminating at Euston Square on the northern side of the metropolis, will probably be augmented fourfold.

To give an idea of the effect of these inpourings of tributary branches, I may state what came under my observation in travelling southwards. The train with which I started from Sheffield, at about nine in the morning, consisted of six carriages, a number which was increased to eight at Rotherham, where the union with the Derby Junction takes place; at the town of Derby, the large station enclosure yielded a contribution of other five carriages, making up the number to thirteen. These were now rapidly whirled along through a fine piece of country, receiving an accession of passengers at every stopping place, till we reached Hampton on the London line. Here the train paused for about twenty minutes, till the train from Birmingham arrived, consisting of seventeen vehicles, exclusive of several trucks, bearing gentlemen's carriages and horses. A union of trains now took place, and produced a row of *thirty carriages* with trucks, resembling the side of a street in motion, and carrying along, as I calculated, from six to seven hundred passengers. This enormous mass, which was dragged along at the rate of at least twenty-three miles an hour by two locomotives, received accessions at some other stations on its way, and, finally, on reaching London, the debouche of passengers on the quay of the railway resembled the emptying of a crowded church. Nine trains go *down*, and nine *up* daily; and though seldom so large as this, the number of carriages being usually ten or twelve, yet the quantity of traffic, and interchange of passengers, between different parts of the country along the great line and its tributaries, are immense, and can be but faintly understood by those at a distance from the scene of action. The money drawn for passengers by the large train in which I reached London, could not be less than six hundred pounds. The weekly revenue of the London and Birmingham, alone, is upwards of L.16,000, and of the Grand Junction, L.9000. Five-and-twenty thousand pounds, weekly, on one extended thoroughfare! The fact is startling.

South and west from London various railways have been projected, and some are opened for short distances in their proposed course. Only one important line has been opened throughout its entire length, being that which extends from the vicinity of Vauxhall, near London, to Southampton, a distance of seventy-seven miles. This is a well-designed and well-constructed railway. It pursues a curved line over the flat downs and moors of Surrey, and by several deep cuttings in the chalky eminences, reaches the rich agricultural plains of Hampshire, and finally terminates in the beautiful vale of the Itchin, close by Southampton and its navigable waters. As an independent line, with no towns of any consequence in its course, Winchester alone excepted, and depending only on its own traffic, it may be pronounced the boldest undertaking of the kind which has yet been completed. I am glad to learn that there is every prospect of the success of this line of railroad. I travelled several short stages upon it at different times, and made one entire journey to and from its southern extremity. There is an arrangement upon it worthy of imitation. Instead of only two kinds of trains, there are three, which differ considerably in character. One is called the Fast Train, which stops at but a few places, and consists only of first-class carriages, with a carriage for servants; it performs the journey in three hours—fare 20s. The next kind are Stopping Trains, which take up and let down passengers at twelve stations on the route, and consist of both first and second class carriages—fares 18s. and 12s. And the third kind is a train for goods, with uncovered carriages, the fare with which is only 7s.; the accommodation being nevertheless equal in all respects to that of the outside of a stage-coach. Both in my *down* and *up* journey by the first-mentioned of these trains, there was a string of ten or twelve carriages, each holding eighteen persons; and at some of the stations, such was the press of passengers, that several were in each case left behind for lack of accommodation—a circumstance, by the way, which I never saw occur on any other railway, there being apparently, in all cases, an abundance of carriages at command. Fully as much revenue is, I believe, expected to be ultimately realised by the transit of goods as passengers by this line of convey-

* We write this, June 20, and observe by a newspaper announcement that the North Midland is to be opened throughout from Leeds to Derby on the 1st of July.

ance. At Southampton, docks, and other accommodations for shipping, are in a state of active progress, and it is anticipated, that not only much of the trade of Portsmouth will centre here, but that many vessels from the Atlantic will prefer disloading at Southampton in preference to sailing up the Channel to the Thames, and that their cargoes will be sent overland by railway to London. I am not able to offer any definite opinion on this comprehensive scheme of operations, but it appears very evident, that unless Portsmouth protect itself by establishing an independent line of railroad to the metropolis, its aspiring neighbour, Southampton, will at no distant day sweep up a large share of its inland and external traffic. Already, as may be seen from public announcements, Southampton has become the chief centering point for intercourse with the Channel islands and with Havre, and when a railway from the last-mentioned place to Paris is completed, this must become a preferable route to France and the countries on the Mediterranean.

Of the short lines of railway connected with London, the principal is one of from four to five miles in length to Greenwich, and which appears about as visionary a speculation as can well be conceived, when put in competition with steam-boats, omnibuses, and other means of locomotion. It is laid entirely on brick arches, on a level with the tops of the adjacent houses, and must have cost much more money than sound prudence would have warranted. Yet this railway, after all, has its conveniences. The public have no reason to complain of it. From a motive of curiosity, I made a trip upon it last Whitmonday, which is a holiday of the working classes in London, and the occasion of a fair, or rather idle assemblage of people, in the town and park of Greenwich. It was computed that on this holiday occasion fifty thousand persons were carried by the different steam-boats to Greenwich from London; but this did not apparently diminish the vast crowds which pressed to the place of festivity by the railway. As a spectacle of a novel nature in connexion with the most wonderful improvement in the arts which has distinguished the present age, the scene of transit was of exceeding interest. For twelve or fourteen hours, a train was dispatched every fifteen minutes, returning as frequently; but for an hour or two at the period of greatest bustle, the dispatch was every five minutes. I happened to go in one of the five-minute trains. It consisted of fourteen carriages, each holding from thirty to forty persons, and was shot along its course, including a stoppage at the middle, in a quarter of an hour. The number of passengers by each train, of which this was a specimen, might be estimated at six hundred, yielding an aggregate fare of about five-and-twenty pounds. From morning to night, the entire number carried along and brought back could scarcely be fewer than fifty thousand, or equal to that carried by the boats. During the same day, there was a procession in carriages through the principal streets of London, of a much more agreeable kind—that of the members of the various temperance associations throughout the metropolis and its suburbs—and though this extended to several miles in length, and was composed of a vast multitude of well-dressed men and women, it did not seem to lessen the efflux towards the festivities at Greenwich.

The Greenwich railway affords a share of its terminus at London Bridge to a railroad which is designed to be carried to Brighton, but which in the mean time is opened only as far as Croydon. On the opposite or Middlesex side of the Thames, a short railway has been constructed between Blackwall and the city at a prodigious expense, through much valuable property. Another line, called the Eastern Counties, intended to proceed to Yarmouth, has been opened as far as Romford, where it is likely to stop for some time.

None of these lines of railroad is of such prospective importance as that which leaves the outskirts of the metropolis at Paddington, and is designed to reach across the country to Bristol; at present it is opened for only about thirty miles. The Great Western, as this line is termed, is one of the greatest and most expensive undertakings as yet set on foot. It pursues a course by Reading and Windsor to Bath, and so on to Bristol, forming a line of 117½ miles in length, and, with one or two tributaries, opening up the whole west of England from Glo'ster southwards to Exeter. I have heard it mentioned that the Great Western line alone will cost five millions of pounds; and on seeing the works, and learning the history of the concern, this sum appears by no means unreasonable. Whether from a crotchet, or the sound judgment of the engineer, the width between the rails has been made seven feet, while on all other railways in this country the width is between four and five feet; the carriages, therefore, which run upon the Great Western must be necessarily confined to itself. The main object contemplated in this extreme width was the laying on of a more powerful class of locomotives, and this has been so far accomplished; but it is extremely doubtful if the unwieldy size of the vehicles and other circumstances, do not form a drawback which will more than compensate the anticipated advantages. The rails by this line are not laid, as is usually the case, on transverse blocks of wood or masses of stone, but, like those of the Newcastle and Shields line, are placed on squared longitudinal beams of timber, secured at intervals by cross rivets of the same material. The motion is, nevertheless, from what cause I know not, only a little more rapid though not more easy than on the ordinary lines. The only difference in the carriages is, that four instead of three passengers sit in the breadth.

The speed at which the quickest-going trains on the various railways usually proceed, varies from twenty to thirty miles, but is sometimes as much as forty miles, per hour. Even in the most favourable instance, the rate of locomotion is greatly below what is possible. It is generally understood, that unless for stoppages, which cause a great slackening of speed, both in approaching and leaving stations, the rate of motion could be very easily sustained at fifty miles per hour. I have no doubt whatever that fast trains, which do not profess to stop on their journey excepting once in every thirty or forty miles for water, will ultimately, and if the public require it, proceed at a rate of sixty miles per hour. When this is accomplished, trains will regularly perform the journey from London to Edinburgh, all necessary stoppages included, in probably eight hours. According to the present comparatively slow rate of progression, the distance from London to Birmingham, which a year or two ago required twelve or fourteen hours by coach, is now performed in four hours and a half, and with perfect ease to the passengers.

The London and Birmingham line, which was the first completed after that of Manchester and Liverpool, has always appeared to me to be among the best managed of the various railways, as well as the most complete in all its arrangements. There are accommodations on this line which I have seen on no other. On all the lines there are waiting-rooms both for ladies and gentlemen at the different stations; but exclusively of these on this line, there is a large and commodious house of entertainment at the Birmingham terminus, where meals stand ready prepared for the passengers. At a place half way from the metropolis, and where the train stops ten minutes, there is likewise a large establishment in the form of an open booth or shop, where tea, coffee, or viands of a more substantial kind, with different liquors, are sold on the instant to those who require refreshment. It would be well if every long railway in the country had similar establishments at convenient distances.

Passengers who make the journey for the first time by the mail train, will be amused by observing a travelling post-office in the string of carriages. This "Grand Northern Railway Post-Office," as the inscription on its side denotes, is a carriage consisting of two small apartments, one of which is appropriated to the guard whose duty is to exchange the bags, and the other is fitted up with a table for sorting letters, and holes round the walls for their reception. The manner in which the duties of the clerk and guard are performed in this flying post-office, is strikingly significant of the new order of things introduced by the railway system. Outside the vehicle a species of net is extended by a hoop, and into this the letter-bags are dropped as the train sweeps onward in its course, the bags which are to be left being at the same time tossed from the window by the guard. The fresh bag of letters being received, it is speedily opened, its contents re-arranged, and a new bag for next town being made up, it is projected as before at the place of its destination. By this means a letter may be written, sent through the post-office, and delivered at the distance of twenty miles in the space of a single hour.

There are certain excellencies in the arrangements of all the railways which deserve to be mentioned. Each line, being the property of a private association, is secluded from one end to the other from the intrusion of the public, and therefore no jostling or confusion takes place either upon entering or leaving the carriages. The rails of one line, likewise, join those of another, by which means carriages generally proceed onwards without changing passengers or luggage. A carriage in which we took our seats at London carried us straight on to Preston—that is, along the lines of three companies. The extraordinary magnitude of the railway undertakings has enabled the directors to organise rules which could never be enforced in the irregular scramble of stage-coaching. It is customary to dress the subordinate functionaries on all the lines in a uniform resembling that of the London police—each man having his number inscribed in figures on some part of his dress; so that, if any one be guilty of incivility or inattention, he can be easily reported to his superiors. There is one delightful peculiarity in the arrangements, which is entitled to the highest commendation: it is the rule that no officer shall on any account take a fee from passengers, on pain of instant dismissal. Those who imagine that fees to guards, coachmen, or waiters, are requisite to ensure civility, will be surprised to find that railway attendants are infinitely more polite and attentive than their brethren of the coach conveyances. This, in itself, gives travelling by railway a great superiority over all other modes of public conveyance.

Talking of coachmen, reminds me of the wonderful change which has taken place in the fortunes of these personages near the great lines of railway in England. I heard of a town through which eighty stage-coaches used to pass daily to and from London: now there are only two. What a falling off for coaches! The men had ample reason to foresee the coming day of distress, but they made no provision against it. In the town just mentioned, a company of fifty guards and coachmen have adopted the expedient of public begging. They go about in a band, with trumpets and other instruments, like a knot of showmen or frozen-out gardeners, picking up a few odd pence and shillings. We may pity these men, but we should at the same time remember that their system was a demoralising one to a great degree, as, indeed, this resorting to mendicancy helps to prove. Their gains were in general much above the value of their services, and were realised in a degrading way. Hence, while many, no doubt, were decent and worthy men, many others were unsteady, and some acted in a manner absolutely ridiculous. I remember one personage who was afflicted with such a plethora of wealth, that all the buttons on his clothes were half-crowns, shillings, and sixpences. But there was another, equally rich, who did things more genteely. On arriving at his destination, he threw down the reins with the air of a prince, touched his hat all round to the passengers, and having pocketed his contributions, took his place in a gig with a liveried servant, who was waiting for his arrival.

Many stories, equally deplorable, are told of the ruination of inns on the formerly leading lines of road. Some "houses" are entirely shut up, and others continue a feeble existence. One inn at W———, perhaps the largest and oldest-established in England, is at present about to be abandoned by its proprietor. Previous to the establishment of the adjoining railway, it maintained in daily use thirty pairs of post-horses, and now it scarcely gives employment to two. But these are a hundred such cases, as every traveller by the old lines of road can readily testify. If, however, there be some individual losses, there are evidently great public advantages from the railway establishments. Every where along the lines, and particularly at the stopping stations, improvements are less or more perceptible, and in some instances entirely new towns are rising into existence on the verge of the newly created thoroughfares. Trade, promoted by rapid personal transit and a cheap means of literary correspondence, is likewise acknowledged to be on the increase in every newly opened-up district. As yet, indeed, the great railway organisation in England, wonderful as is its extent and capacity, is only in its infancy, and a few years will necessarily be required for its perfection. When this period arrives, social improvement, in despite of every opposing principle, will be developed beyond the most sanguine expectations of its advocates.

A STORY OF THE VENDEAN REIGN OF TERROR.*

WHILE residing at Nantes, I had repeatedly heard of a person, usually called the Wild Man of the Rocks, who had taken up his abode in a secluded cave, and had there passed many years, only issuing forth now and then by night to receive the means of sustaining life from the charity of the neighbouring villagers. It was well known that he had been a physician in Bretagne, at the era of the first Revolution, and that he had escaped in some extraordinary manner from the proscriptions of the terrible Carrier, one of the worst of the many wretches whom the agitations of that time raised to note and power, and who made the city of Nantes the scene of calamities far exceeding those of even Paris itself. But no one knew the particulars of the history of Lormet, as the old hermit was named. I was seized with a curiosity to see him, and, after some difficulty, not only accomplished my wish, but prevailed upon him to relate to me the events which had affected him so deeply as to cause his voluntary separation from the society of his fellow-creatures.

"I was thirty years old," said Lormet, whom I found to be no maniac, as some supposed, but a calm and thoughtful old man, "and was engaged in the exercise of my profession in that part of Bretagne called *La Vendée*, when the civil troubles began to desolate our unhappy province. A principal part of my employment consisted in my attendance upon the distinguished families of Josselin and Rochemaure, the existing members of which honoured me with their warmest friendship. These houses, connected by frequent former alliances, were about to be still more closely united by the projected marriage of Isidor de Josselin and Hortense de Rochemaure, the heirs of their respective families. The end of the year 1792 had been fixed upon for this union. Isidor, the eldest of three sons, was at this time only twenty-two years of age; but he had already given such indications of talent, and had exhibited so many virtues, as to be looked upon by the whole province as one destined to high distinction among his countrymen. Hortense was an orphan. She had reached the age of seventeen years, and lived with the Marquis de Rochemaure, her grandfather, by whom she was almost idolised; and if beauty and amiability of character could excuse a feeling so strong, Hortense was one well worthy of it. The betrothed pair had been fondly attached to one another from childhood, and every thing was full of smiling promise for their future happiness.

Such was the state of the two families when the standard of civil war was raised in the provinces, and a proclamation addressed to the gentry of Bretagne, calling upon them to take part with the *republic*. In the absence of her husband, who had gone abroad at the first outbreak of the Revolution, Madame Josselin repaired

* This tale is abridged from a French work, entitled "The Hermit in the Provinces," the production of M. E. Jouy, a well-known traveller in his native land.

Digitized by Google

with her three sons to the chateau de Rochemaure, to take counsel with the old marquis as to the steps proper for herself and her family to adopt in the existing conjuncture. I was present (continued Lormet) at that consultation. The marquis advised Madame de Josselin herself to join her husband without delay. 'As to your sons,' said the marquis, 'they should remember the Athenian law, which condemned to death every citizen who did not take *one* side or another in times of civil trouble. They held it base in any one to wait till he saw what would be his interest, before declaring what his course was to be. Your sons are now old enough to judge of their duty, and they should follow it. For me, I am too old to bear arms in any cause, or to seek an asylum in a foreign land, and it is my resolve to wait here the issue of events in quietness, so long as I am permitted to enjoy it. But the issue, I fear, will be dark and calamitous to all France.'

Madame de Josselin adopted the counsel of the marquis, and left the country with her youngest son. Her two elder children, notwithstanding the prejudices of birth, had long been alive to the wrongs inflicted on the people of France by their superiors, and they gave in their adherence, accordingly, to the popular cause. Isidor was immediately named commandant of a volunteer battalion of the Loire, and at the head of it was sent to Mayence to join General Kleber. But the hope which the young man had entertained of being appointed to combat with his country's foreign enemies, was suddenly brought to an end. The garrison of Mayence, of which he formed a part, was ordered to La Vendée, the very province of his birth, and the abode of his Hortense. Against it was he to go as an enemy, and there to engage in mortal contest with his countrymen and friends. So deeply did this idea distress him, that, on reaching La Vendée with General Kleber, whose favour he had completely gained, Isidor made an appeal to his commander to be permitted temporarily to quit the army. But this appeal was met by a hint of the reflections which might be thrown out against him by others, especially as a battle was hourly expected; and Isidor at once saw that, at the moment at least, he could not honourably be relieved from his painful situation. He remained, was present at the engagement of Torfou, and had the honour of being advanced to the rank of chief-of-brigade by Kleber, for his conduct on the field. But Kleber was immediately called to the army of the north, and the subsequent disposition of things compelled Isidor to remain behind with his battalion. His entreaties procured a promise, however, that the general would send for him to the north within a month afterwards.

The inquiries of Isidor procured him intelligence respecting Hortense and her grandfather, that at once pleased and vexed him. He learnt that the neutrality preserved by the marquis had not saved him from suspicion, and that he had been compelled to quit his chateau, but had escaped with his grandaughter to some place not known. Trusting that they were in safety, the young soldier longed for the summons of Kleber, to take him from a scene where the fulfilment of his duty was so painful. But at this time Carrier, the execrable Carrier, came to Nantes. With the eagerness of a bloodhound, this man caused the republican soldiers to scour the country incessantly in search of prey. Isidor was forced to act under his orders for a few days, and was sent with his battalion to take the Castle of Clisson, where several Vendean chiefs, it was known, were accustomed to meet. When in action, Isidor forgot all but his immediate duty, and on this occasion he speedily made his way, at the head of a few of his men, into the castle. In a lower hall, he found five or six wounded Vendean officers. 'Surrender, gentlemen,' cried Isidor, 'and I pledge my word for the safety of your lives!' His men echoed the pledge. 'You promise more than you can perform,' replied an old Vendean officer, calmly. 'Once taken prisoners, we are in the hands of Carrier, not yours; and we must certainly perish on the scaffold. Permit us to go,' continued he after a pause, 'and we shall yield our arms, and engage never more to bear them against the republic.' This was all that Isidor desired from those whom he opposed in this civil struggle, and he consulted his comrades with the view of gaining their consent. Guided by him, they gave it at once, and the officers were told that they were at liberty to depart. Before going, however, the old officer again spoke. 'I have another prayer to make,' said he. 'Do not burn the castle. It was the cradle of a brave man, and such an edifice should be sacred.' Having said these words, he turned to Isidor, and whispered a brief sentence in his ear, after which he departed with his friends.

That whisper affected Isidor most painfully. He became deadly pale, and staggered back, as if struck by a cannon-shot. The sound of fire-arms recalled him to activity, if not to composure, and he rushed out to discover the cause. Alas! the poor Vendeans had been observed by others of the investing band, and, before a word of explanation could pass, had been shot on the spot. Immediately afterwards, the whole of the soldiers entered the castle, and a search commenced, in which the young commander, contrary to his usual custom, appeared to take the most active share. Under the plea of anxiety to fulfil his duty, he allowed no one to search but with himself. The task at length was finished, and then the troop, according to their usual custom, proceeded to set the place on fire. Isidor addressed them in opposition to this design. He called to their recollection its founder, Oliver de Clisson, the terror of the Flemings, and scourge of the English; and concluded by saying, that, in any case, they ought not to destroy the castle except by express orders, especially as he had proposed to occupy it as a favourable station for continuing the war. This little harangue had the desired effect. The castle was evacuated, and Isidor made all possible haste to report the issue of the expedition to the officer above him in command, who, at the young soldier's own suggestion, sent him back with a single picquet of cavalry, to occupy Clisson and its neighbourhood. Isidor established his men in a building at the end of the park, and then took an opportunity of entering alone the deserted castle.

The scene which then took place is not to be described. There Isidor, as he had been warned by the Vendean chief, found his beloved Hortense and her grandfather, concealed in the secret chamber where the family papers were kept. It may be imagined with what terror the proposal to burn the castle inspired him. The secreted pair, he found, had been prepared to fly in the garb of peasants towards Paris, just before the castle was taken. Now, the scheme was renewed. Isidor, over whose mind the remembrance of the terrible Carrier threw an inexpressible degree of alarm, counselled flight on the following day. This being arranged, he tore himself from them, to avoid raising suspicion. An awful shock awaited him on rejoining his men. A paper was handed to him, containing these words:—'By order of the representatives of the people, Carrier and Francastel, the chief-of-battalion, Josselin, will instantly arrest and conduct towards Nantes, the rebel Rochemaure, whom he will find concealed in the Castle of Clisson,' &c. The unhappy young officer, as soon as night fell, returned to the castle, and without being able to articulate a word, placed the order in the hands of M. de Rochemaure. 'I expected it,' said the old man, calmly. Hortense saw by the looks of her lover that something alarming had occurred. 'Tell me, Isidor, what has happened! Tell me, I conjure you!' The youth turned away his head, but the marquis answered for him. 'It would be of no avail to conceal it. The poor boy has received orders, my child, to arrest me.' Hortense gave a cry of poignant distress, and threw her arms around her grandsire. 'We must all fly instantly,' cried Isidor, starting as if from stupor; 'the park adjoins a forest, which I have well examined. We can find temporary safety there, at least, and may afterwards reach the hamlet beyond.' 'That is what I was about to propose,' said the old marquis. 'You have no other way, Isidor, of saving your wife—yes, your *wife*; for, from this moment, Hortense is yours, and you must answer for her protection before heaven and before men!' Such a thought was capable of giving pleasure to the unfortunate pair, even in that hour of distress; and they kneeled down to receive the old man's blessing. Having given this with tears, the marquis continued to enjoin the necessity of flight. 'My father,' exclaimed Hortense, 'you do not speak of yourself.' The marquis now pointed out the necessity of their separation. He said that his age and infirmities would but impede their flight, and render it vain; and that he himself would even be safer alone. To all this Hortense had but one reply, 'No, no, I will never quit you! never!'

An hour was spent by the marquis in endeavouring to combat this resolve of his grandchild. The period of safety was fast passing by, for Isidor had been informed that Carrier's detestable body-guard were to come at morning to meet him and receive his prisoners. At length, finding Hortense still resolute, the marquis arose, and, saying solemnly, 'Isidor, remember your duty to your wife,' went into a little side apartment. In an instant, the sound of a pistol indicated that the old man had sacrificed himself to terminate the scruples of his grandchild, and enable her to be saved!

It was with great difficulty, and only after a long delay, that Isidor could separate Hortense from the body of her unfortunate parent. But he finally prevailed upon her to quit the castle. The pair entered the forest, and after walking till dawn, reached the banks of the Loire at the village of Broussards. They had the hope, if they could procure a boat to convey them across the river, that they would then be in comparative safety; and they were on the point of entering one, when some soldiers, belonging to one of the roving bands of the republican army, were drawn to the spot. The extraordinary beauty of Hortense attracted the admiration of these ruffians, and they attempted to stop the embarkation. Isidor ordered them to desist, announcing himself as the commandant of Clisson; but his words only bred suspicion, and he was compelled to draw his sword and repel them by force. More of the wretches came to the spot, however, and the unhappy lovers were both seized and hurried off to Nantes, which was close by, for examination. The anxiety of any person to escape was in these times fit cause for apprehension and execution.

On that day (continued Lormet) I myself had been thrown into prison. I was seated on a bench amid a crowd of other unfortunates, not one of whom had even a hope of life, when my attention was attracted by a conversation close behind me. 'We shall at least die together, Isidor,' said a low female voice. 'No, no, you shall not die, Hortense!' was the reply; 'so much youth, and beauty, and innocence, must find grace even with these monsters.' 'If you love me, Isidor, do not even wish such a thing! I have seen my father expire, and death awaits my husband—yes, my husband, Isidor, and no power shall prevent me sharing his fate.' The two speakers wept for a time in each other's embrace. 'But what a death, Hortense!—oh, you know not all its horrors!' 'We may escape, Isidor,' said she, in a whisper almost of exultation; 'we are not without the *means*.' I turned round as she spoke, and saw that her features bore the marks of the deepest despair.

It was now that I spoke to the ill-fated lovers, and that the deed was consummated which has made me spend my days in solitary prayer far from the dwellings of men. Isidor and Hortense knew me instantly, and, in the contemplation of my misfortunes, forgot their own for a moment. But this forgetfulness could not last long. I told them I had overheard all, and Isidor, with indescribable eagerness, besought me, if I could, to rescue Hortense from the horrible indignities of a death such as Carrier gave his victims. I understood him too well. About my person I had a small quantity of poison—the necessity was dreadful. Why linger on the issue? Believing that I was conferring a benefit, and indeed feeling that I was making a great personal sacrifice, I gave it to the unhappy pair. It saved them from all sense of the barbarities that followed in a few hours, when one hundred and twenty-five unfortunates, men, women, and children, were taken on board a boat, tied together by pairs, and drowned in the Loire, in presence of Carrier and his band. The accompanying brutalities of the scene are not to be told. These were the too famous *Noyades* (drownings) of La Vendée!

I saw (concluded Lormet) the bodies of Isidor and Hortense committed to the waters of the Loire. I myself underwent the same doom, but by a train of accidental circumstances, which have no particular interest, found myself rescued from death. For all that has happened to myself, I might still be among men, but I prefer to remain in solitude, and feed my thoughts with the remembrance of the unhappy pair with whose fate I was connected—a pair such, in person and mind, as heaven has seldom lent to earth."

MEMOIRS OF A RUSSIAN LADY OF HONOUR.*

The Princess Daschkaw was the intimate friend of one of the most remarkable personages of modern history, Catherine II., Empress of Russia. The vices which stained the character of Catherine as a woman, cannot prevent the world from taking a strong interest in her as the able and successful ruler of a great empire; and hence we peruse these volumes with no slight degree of curiosity.

The Princess Daschkaw was of the Worontzow family, one highly distinguished in the Russian annals, and several members of which were in office under the Empress Elizabeth, at the period of our heroine's birth, which took place in 1744. She was therefore much about the court even from her infancy. When little more than fifteen, she was married to her countryman, Prince Daschkaw, to whom she was ever fondly attached. A story is told by her, which gives a striking proof of her conjugal affection in the early years of her wedded life. After a temporary absence from Moscow, where his family then lived, the prince returned to it in a state of ill health; and being unwilling to alarm the princess, at that time in a situation requiring such caution, drove first to his aunt's house. A giddy servant girl informed the poor young wife of his illness and secret return, and her fears magnified the danger so greatly, that, in spite of her condition, she left her chamber, and rushed through the streets to the house where the prince was. "I know not (she says) how I scrambled up a high flight of steps which led to my husband's apartment. All I can tell is, that, on entering, I saw him pale and extended on his bed. I caught but a momentary glimpse, and fell lifeless on the floor, and in this state was conveyed home in a litter." Prince Daschkaw believed at first that he had seen a vision, but he followed her home instantly. His complaint being infectious, he was not allowed to see his wife, and the pair had to content themselves with writing to each other hourly. Happily, both of them recovered. After "forty long years of sorrow" for her husband's loss, the princess remembered these things, she says, with profound pleasure; and we confess to have been also pleased, as well as prepossessed in her favour, by finding, on the threshold of her memoirs, this strong, though certainly very foolish, proof of her affectionate disposition and conjugal tenderness.

Catherine, afterwards Empress of Russia, was at this time grand-duchess, being wife to Peter, nephew and heir-apparent of the reigning sovereign Elizabeth. The circumstance which first drew the notice of Catherine to the Princess Daschkaw is worthy of notice. "At the period of which I am speaking, there were not two women in the empire, excepting the grand-duchess and myself, who occupied themselves at all in serious reading; here was a point of mutual attraction." The grand-duchess had abundance of time to devote to the amusement, for she was hated and deserted by her husband, a person described by the princess, and with justice, as an annoying blockhead. The two principal features in his character

were, a strong love of all things military, and an intense admiration of the Prussians, whose sovereign he actually termed "the King my Master." He was perpetually surrounded by a band of officers, "who had been for the most part *corporals* or sergeants in the Prussian service, the truant sons of German shoemakers, and such as had risen from the very dregs of the people." With these personages, "over punch, tea, and tobacco," and engaged in ridiculous games, the grand-duke passed his whole time. The Princess Daschkaw was compelled to be sometimes present at these entertainments, and was so little able to conceal her contempt for the entertainer, as to give him replies now and then that caused his very familiars to stare, and exclaim, "What a spirit that woman has!" When the Empress Elizabeth was on her death-bed, the prospect of danger to the grand-duchess Catherine, from the accession of her husband to power, greatly alarmed the Princess Daschkaw. The revolution that overturned the government of a great empire, was concocted by this active and energetic woman, who, on hearing that the empress was certainly dying, proceeded, in the middle of a winter night, to the palace of the grand-duchess. The latter was in bed. "'My dearest princess,' said she, 'before you tell me what brings you out at such an extraordinary hour, endeavour to warm yourself; you are, indeed, too negligent of your health, which is so precious to us all.' She then bade me get into the bed, and having well muffled up my feet, she at length allowed me to speak." In this somewhat odd position, these two women first openly spoke of overthrowing the succession to the throne of Russia.

Peter, however, at first obtained the sceptre peaceably. Immediately afterwards, he began to annoy and disgust every body. His passion for military parade proved ludicrously troublesome to various respectable old gentlemen who had all their days been peaceful civilians. "I could not help smiling when I perceived the old prince Troubetskoy, who was at least seventy years of age, suddenly metamorphosed into a military character, and now, for the first time in his life, arrayed in full uniform, braced tight as a drum, booted and spurred, and prepared for desperate combat. This fearful vision was one of the dauntless warriors of the court of Peter." These and many worse propensities of the czar offended and alarmed the country, and paved the way for the revolution. This event was finally effected by a dashing stroke of the Princess Daschkaw. Having sounded the Ismaeloffsky guards, and found their disposition favourable, she boldly ordered them out to receive the empress-consort, on her entering the capital from Peterhoff. The guards obeyed; they received Catherine with shouts, and, being joined by the people, at once proclaimed her the head of the empire. Peter was thrown into confinement, and was soon after most barbarously murdered. The princess assuredly had nothing to do with this matter, and she also declares the empress entirely innocent of all share in it. Such may be the case, but it is undeniable that the Orloffs, on whom the princess lays the guilt, were both before and afterwards the unworthy favourites of the empress. In whatever manner it may be palliated, the murder of Peter reflects indelible disgrace on Catherine.

We have perhaps spent too much time upon this matter, but our excuse is, that the compassing of this revolution, by which Russia was saved from a probably long career of gross tyranny, was the great event of the Princess Daschkaw's life. She lost her husband early, and in 1769 made a journey through Europe, which she repeated a few years afterwards, chiefly for the benefit of her children's health and education. She visited France, and became intimate with many distinguished persons, among others Diderot and Voltaire. On being first introduced to the latter, she found him in very bad health. "He was supported into the room by his valet-de-chambre, and placed on his *knees* in a great chair, over the back of which he leant, and continued opposite to me in this uneasy posture during the whole of supper-time. This sort of constraint, perhaps, disappointed a good deal the expectations I had formed from this visit." On first hearing the princess speak, he behaved most characteristically. "He disconcerted me excessively by raising up his arm in a theatrical manner, and with a tone of astonishment exclaiming, 'What is this I hear! even her very voice is the voice of an angel!' As I came only to admire *him*, to be flattered so extravagantly was certainly the last thing in my thoughts —and so I believe I told him." Voltaire, she also tells us, was much afraid of the ingenious trickery of a neighbour, M. Hubert, "who had a little favourite dog with which he used to divert himself at the other's expense by making him snap at a piece of cheese, which, after two or three twists in his mouth, turned out so exact a likeness of Voltaire, that one would have said it was a miniature copy of the famous bust of Pigal."

Another incident of her travels, of a still more diverting description, may here be cited:—"At Dantzig, where we were to remain a couple of nights, we lodged at the Russian hotel, the most considerable in the place. On being shown into the large eating-room, I was struck with two pictures, the subjects of which were battles lost by the Russian troops, who were represented in groups of dead and dying, or on their knees, supplicating mercy of the victorious Prussians. I was so scandalised at the figure my countrymen here made, in the sight of travellers of all nations who frequented this hotel, that I seriously set about upbraiding M. Rebender, our chargé d'affaires, for allowing such an abominable monument of our disgrace to exist. He gravely replied that it was quite out of his province to repress grievances of such a nature; 'but, madam,' said he, 'you are not the only one whom these battles have offended: Alexis Orloff, when he passed through Dantzig some time ago, was at this same hotel, and was no less indignant at the pictures than yourself.' 'Why did he not, then, buy them,' said I, 'at any price, and throw them into the fire? Were I a twentieth part as rich, I would do so in a moment; but, as that is not the case, I must have recourse to a plan which will, perhaps, answer as well.' As soon as our resident left us, I commissioned two gentlemen, MM. Woltchkoff and Schtellin—both belonging to our embassy at Berlin, whither they afterwards accompanied us—to buy me some oil colours, blue, green, red, and white; and as soon as supper was over, and we had well barricaded the doors, these gentlemen, who knew how to handle a pencil, assisted me in regaining these lost battles, by changing the blue and white of the conquering Prussians into the green and red uniforms of our Russian heroes. It cost us the whole night to achieve this twofold victory; and it must have occasioned no little surprise and curiosity among the good people of the house, to find that three of our party were thus locked up together, and their dull room, hitherto the refuse of the yawning traveller, lighted up all night, and suddenly become the theatre of some mysterious mirth. For my part, the idea so enchanted me, that I was like a truant child, both fearful and triumphant at the frolic. The next day, I had my trunks unpacked in this same field of battle, as the only excuse I could offer for keeping every one out of it but those of our party and the two companions of my prowess."

The princess visited Scotland in 1778, and placed her son for a time at the University of Edinburgh, under the charge of Principal Robertson. "The very names (says she) of Robertson, Blair, Adam Smith, and Ferguson, are sufficient to denote the privilege and pleasure I enjoyed in their society." She herself was universally admired, alike for her wit and extensive intelligence, as for her qualities of heart, her uprightness, and her benevolence. On returning to Russia, she received many marks of favour from Catherine, and at last that all-powerful personage, having the belief, not unsupported by personal experience, that women could manage all sorts of affairs as well as men, actually named the princess "Director of the Academy of Arts and Sciences!" To do the princess justice, she obstinately resisted this nomination. "Appoint me (said she) directress of your majesty's washerwomen, and you shall see with what zeal I am capable of serving you." But the empress was peremptory, and the princess was obliged to succumb. Once satisfied of the necessity for assuming the office, she turned to the duties of it with her usual promptitude and good sense. Accompanied by the illustrious Euler, she took her place at the head of the Academy, and addressed them in a harangue full of point and force. The Academy was then in a state at once of decay and corruption. "I am resolved to allow not the smallest peculation (said she) in the offices." The academy was in debt, and that deeply, and its publications had been stopped. The princess again published the Transactions of the body, and, in order to pay the debt, "had recourse to the expedient of offering those books for sale which were issued from the academic press, at thirty per cent. lower than the established prices. From this source I had soon the means of paying these debts, of raising the stipends of all the professors, and also of establishing three new courses of lectures in mathematics, geometry, and natural history, which were delivered gratuitously." In short, the princess put the academy to rights in *one* year, without any external aid whatever. An extraordinary sight it must have been to see the ablest men in the country standing idly by, totally unable to help themselves, while this talented woman was actively and successfully labouring to relieve them.

The Princess Daschkaw survived her mistress, and was exiled under Paul, a doom from which she was freed by Alexander. She spent the greater part of her advanced life at Troitskoe, her estate near Moscow; and here she was living in 1803, when visited by Miss M. Wilmot (now Mrs W. Bradford) a young English lady whose relatives she knew, and who has acted as editor of these Memoirs, intrusted to her for the purpose by the princess. The following excellent sketch of the latter in her advanced days, is from the pen of Miss Wilmot's sister:—"I wish you were to see the princess go out to take a walk, or rather to look over her subjects. An old brown greatcoat, and a silk handkerchief about her neck worn to rags, is her dress; and well it may be worn to rags, for she has worn it eighteen years, and will continue to wear it as long as she lives, because it belonged to her friend Mrs Hamilton. There is an originality in her appearance, in her manner of speaking, in her doing every description of thing, which distinguishes her from every creature I ever knew or heard of. She helps the masons to build walls, she assists with her own hands in making the roads, she feeds the cows, she composes music, she writes for the press; she talks out loud in the church, and corrects the priest if he is not devout; she talks out loud at her little theatre, and puts in the performers when they are out in their parts; she is a doctor, an apothecary, a surgeon, a farrier, a carpenter, a magistrate, a lawyer—in short, she daily practises every species of incongruity; corresponds with her brother, who holds the first post in the empire; with authors, with philosophers, with Jews, with poets, with her son, with all her relatives; and yet appears as if she had her time a burden on her hands. She gives me continually the idea of her being a fairy; and I protest it is not jokingly that I say so, for the impression never quits me for a moment."

The princess died in 1810. To the memoir of her life, there is appended a considerable amount of correspondence, and also an interesting narrative of the editor's own stay in Russia. Were it but for this narrative alone, the work would be well worthy of the public notice. We conclude with an extract illustrative of Russian despotism:—"It is well known that, during the reign of Peter I., it was the custom of that tyrant to punish those nobles who offended him, by an imperial order that they should become *fools*; from which moment, the unfortunate victim, however endowed with intellect, instantly became the laughing-stock of the whole court; he had the privilege of saying every thing he chose, at the peril, however, of being kicked or horsewhipped, without daring to offer any sort of retaliation; every thing he did was ridiculed, his complaints treated as jests, and his sarcasms sneered at, and commented on, as marvellous proofs of understanding in a fool. The Empress Anne surpassed this abominable cruelty, but sometimes mingled in her practices so much of oddity, that it was impossible not to be entertained. Once she decreed that a certain Prince G—— should become *a hen*, to punish him for some trifling misdemeanour; and for this purpose, she ordered a large basket, stuffed with straw, and hollowed into a nest, with a quantity of eggs inside, to be placed conspicuously in one of the principal rooms at court. The prince was condemned, on pain of death, to sit upon this nest, and render himself to the last degree ridiculous, by imitating the cackling of a hen. This same empress was very fond of the Countess Tchernicheff, and frequently ordered her into her presence, to divert her by her amusing conversation. This poor lady became, however, exceedingly unwell, and her legs swelled so violently, as to make it quite a martyrdom for her to stand. The empress, never conceiving the possibility of a subject being tired in the presence of her sovereign, and not wishing to deprive herself of the entertainment she experienced in her society, for a long time saw her suffering before her eyes, without offering the slightest relief. One day, however, perceiving her ready to faint, and vainly trying to support herself, first on one foot and then on the other, yet still forcing her spirits into gaiety, the empress took compassion on her poor favourite, and said, 'Thou mayest lean upon that table, and Anna Ivanovna (her majesty's chief attendant) shall stand before thee, and screen thee from me, so that I may not see thy attitude.' With this anecdote of a female despot, we close these entertaining memoirs.

POETRY OF GEORGE BUCHANAN.

The scholarship, integrity, and general talent of George Buchanan, are universally acknowledged; but few persons are aware that his character had its soft as well as its stern features, and that he was a dramatic and lyrical poet whose strains must have still been familiar to his countrymen, if they had chanced to be expressed in a language readily and generally intelligible. He had studied the Greek and Roman poets, not as a pedagogue, but as a man of poetic feeling and power, and it was rather his misfortune than his choice that, neglecting his own homely vernacular, he composed his verses in Latin. We propose to introduce, in this place, a few specimens of his poetic talents, in an English dress, that our readers may form some acquaintance with those portions of his character which we have remarked to be at present generally unknown. Here, of course, we must fail in a great measure to convey a due impression of the exquisite felicity of his language; but it may be possible to give some notion of the style of his ideas.

He has many sprightly and graceful lyrics addressed "to Neæra," some of them in a strain only too voluptuous for modern taste. Whether this was a creature of his imagination or the object of a real passion, his biographers do not inform us; but assuredly the latter case seems the more probable one, when we consider the earnestness with which he addresses her. In one, of which we give a translation by the late Mr Robert Hogg of Peeblesshire, there is, it is true, some trace of the conceit of the Cowley school, but it is elegant and playful conceit:—

My wreck of mind, and all my woes,
And all my ills, that day arose,
When on the fair Neæra's eyes,
Like stars that shine,
At first, in hapless fond surprise,
I gazed with mine.

When my glance met her searching glance
A shivering o'er my body burst,
As light leaves in the green woods dance,
When western breezes stir them first;
My heart forth from my breast to go,
And mix with hers, already wanting,
Now beat, now trembled to and fro,
With eager fondness leaping, panting.

Just as a boy, whose nourice woos him,
Folding his young limbs in her bosom,
Heeds not caresses from another,
But turns his eyes still to his mother,

Digitized by Google

When she may once regard him watches,
And forth his little fond arms stretches;
Just as a bird within the nest
That cannot fly, yet constant trying,
Its weak wings on its tender breast
Beats with the vain desire of flying.

Thou, wary mind, thyself preparing
To live at peace from all ensnaring,
That thou might'st never mischief catch,
Placed'st you, unhappy eyes, to watch
With vigilance that knew no rest,
Beside the gateways of the breast;
But you, induced by dalliance deep,
Or guile, or overcome with sleep,
Or else have, of your own accord,
Consented to betray your lord;
Both heart and soul then fled and left
Me spiritless, of mind bereft.

Then cease to weep; use is there none,
To think by weeping to atone;
Since heart and spirit from me fled,
You move not by the tears you shed;
But go to her, entreat, obtain:
If you do not entreat and gain,
Then will I ever make you gaze
Upon her, till in dark amaze
You sightless in your sockets roll,
Extinguish'd by her eyes' bright blaze,
As I have been deprived of heart and soul.

It is not unworthy of remark, that Milton alludes to this heroine of Buchanan in the well-known passage—

"To sport with Amaryllis in the shade,
Or with the tangles of Neæra's hair."

The Ode on the First of May is one of the most poetical of the productions of Buchanan. It has been beautifully translated by Archdeacon Wrangham, as follows:—

Hail! sacred thou to sacred joy,
To mirth and wine, sweet First of May!
To sports, which no grave cares alloy,
The sprightly dance, the festive play!

Hail! thou, of ever-circling time
That gracest still the ceaseless flow!
Bright blossom of the season's prime,
Aye hastening on to winter's snow!

When first young Spring his angel face
On earth unveil'd, and years of gold
Gilt with pure ray man's guileless race,
By law's stern terrors uncontroll'd:

Such was the soft and genial breeze,
Mild Zephyr breathed on all around;
With grateful glee, to airs like these
Yielded its wealth th' unlabour'd ground.

So fresh, so fragrant is the gale,
Which o'er the Islands of the Blest
Sweeps; where nor aches the limbs assail,
Nor age's peevish pains infest.

Where thy hush'd groves, Elysium, sleep,
Such winds with whisper'd murmurs blow;
So, where dull Lethe's waters creep,
They heave, scarce heave, the cypress-bough.

And such, when heaven with penal flame
Shall purge the globe, that golden day
Restoring, o'er man's brighten'd frame
Haply such gale again shall play.

Hail, thou, the fleet year's pride and prime!
Hail, day which Fame should bid to bloom!
Hail, image of primeval time!
Hail, sample of a world to come!

Buchanan also wrote a longer and more elaborate poem on May-day, which has never, as far as we know, been published in an English form. Of this poem the late Professor Christison of the University of Edinburgh was an enthusiastic admirer: he used to recite portions of it to his class, at the same time pointing out its many beauties. From a manuscript translation by Mr Hogg, we present a few of the descriptive passages:—

Now sports invite, and with them move along
The freakish dance, and soothing love and song,
And joy, which not its usual check restrains,
In riotous indulgence boundless reigns. * *
The stormy clouds float now in fleecy wreaths,
Among the leaves a breeze more gentle breathes;
Robes of a lovelier green the earth array
More plenteous foliage the woods display,
And o'er gay fields are cattle sporting gay;
The horse, from toil set free, upon the plain
Gambols, and tosses oft his flowing mane. * *
Now in the shade, the shepherd, stretch'd along,
Dispels solicitude with artless song,
Or lists its murmurs as the streams flows by,
Or sleep invites 'mong fragrant grass to lie.
The angler, sitting by the placid brook,
Watches his slender tremulous line; his hook,
That tells its errand, lingers to repair,
Or loosens ravell'd lines with cautious care.

To the tree planted near, the vine-twig cleaves,
And clothes its naked trunk with borrow'd leaves;
The apple blossoms paint the grove; the vine
Prepares its clusters; rich in prospect shine
The sunny fields, and Tityrus prepares
For you white lilies, Thestylis, and bears
Fruits of a mingled gold and purple hue,
In basket wove of shrubs on which they grew;
The swallow and the nightingale he brings,
And pigeons with their young beneath their wings. * *

One of the dramas of Buchanan is formed upon the death of the Baptist, which our poet represents as chiefly brought about by two priests of the temple. In these personages there can be no doubt that Buchanan described bigots of his own age and of the faith which he had himself deserted; that he thus made a shrewd guess at the characters of the persecutors of an earlier day, no reader of the present age can doubt, for characters absolutely identical are every where seen around us. The tragedy of "Jephthah," as might be expected from the subject, is of tenderer interest, and presents many eloquent passages. The following extract contains perhaps one of the most beautiful—a lamentation over the fallen state of Israel, by a band of Hebrew maidens, who serve in this play the purpose of the chorus in the Greek drama:—

Oh! river Jordan, whose clear wave
Our vales of beauty waters,
Hear those who now an answer crave,
A choir of Judah's daughters:
And thou, whose leaf-enshrouded peak
With snows is never hoary,
From out thy palmy forests speak,
Oh Sion, mount of glory!
Shall ever our tear-laden eyes
Behold that blissful morrow,
Which frees our land from foreign ties,
And breaks her bonds of sorrow?
The noble race of Israel pines,
By base oppressors wounded,
And *they* who spurn'd proud Pharaoh's lines
Of chariots, spear-surrounded—
Who passed the Red Sea's stormy crowd
Of billows, deep-divided,
And 'mid the desert sands unplough'd
Without dismay abided—
Who bore without alarm the sight
Of monstrous giant races—
They of the timid Ammonite
Now drag the chariot-traces!
No greater shame than this, the base
To serve with tame devotion!
But Thou, great Sire, whose voice allays
The dark and troubled ocean,
Or can from slumbering calm upraise
Its waves to wild commotion—
Who shak'st the firm and stable land
Down to its deep foundations,
And of the mobile, starry band
Controllest the mutations—
Oh, let the ills thy people bear
Avert thine angry glances,
And free us, by thy helping care,
From all our sad mischances.

We propose to add but one other specimen: it is a description, by a messenger, of the conduct of the Hebrew maid, when, in accordance with her father's vow, she prepares to die at the altar. The translation of the above and of the following piece is from a manuscript by Mr Thomas Smibert:—

When the doom'd maid before the altar stood,
Her cheek, unused to meet the common eye,
Was deeply mantled o'er with modest blood,
Like Indian ivory stain'd with purple dye,
Or roses mingled with the lily's snow;
But on her face, along with this chaste glow,
An air of dauntless resolution shone,
And while all wept, she tearless stood alone;
With downward gaze, prepared to meet her fate,
While all the people mourn'd her sad estate.
Some there recall'd the father's recent deed,
Through which the land from bondage had been freed,
Then thought how dark would be his home, and lone,
With that bright flower, its pride, for ever gone!
Some mourn'd the dark vicissitudes of fate,
Which makes awhile the heart of man elate,
Then tempers all his hopes with sharp annoy,
And clouds with years of grief his day of joy.
Others bewail'd the victim's piteous case—
Thought of her youthful loveliness and grace,
Her starlike eyes and flowing hair of gold,
And heart above a woman's nature bold.
It seem'd, indeed, as Heaven had deign'd to shed,
In that last hour, new charms around her head;
As the sun's splendour deepens, when he laves
His burnish'd tresses in the western waves;
Or as the rose, when days of flowers are o'er,
Seems to the sense still sweeter than before.
So, standing thus upon the verge of death,
Prepared and willing to resign her breath,
Untouch'd by fear, she drew the awe-struck gaze,
And solemn silence fell on all, and deep amaze. * *
Lifting her eyes to heaven, the high-soul'd maid
With holy lips, and steady accents, pray'd:
"Eternal Sire, and Architect of all,
Incline an ear unto thy servant's call;
Look down in pity on this erring race,
And let my spirit meet a Father's grace.
Oh! if thine ire still unappeased remain,
Whate'er the doom reserved to cleanse the stain
Of leaving thee for gods of stone and clay,
May this my blood the hand of justice stay!
Oh! that not once alone the stream could flow!—
If Judah's land may buy redemption so,
Let all thy anger, Lord, descend on me,
Although a thousand deaths the price should be!"
Then cried she to the priest, who shook with fear,
"Approach! there is no cause for terror here!
Throw ope the gates that shut the soul in clay,
And let my spirit leave this earthly day,
That so my parent's vow from all may pass away!"

DESCRIPTION OF ENGLAND.

The following very luminous "Description and History of England," was lately written as a school essay by a young lady in London, of eleven years of age:—

"The chief town of England is London. It is a merry, busy place. There are a great many people in it. It is very sooty. There are no fields in London, but it is full of houses; and there are several parks and squares for the people to walk in. The country is quite different from London. It is full of fields, which are divided by hedges. There are four seasons in England: spring, summer, autumn, and winter. In spring, the leaves of the trees become green, and there are buds to the flowers. In summer, the flowers are in blossom, the birds sing, and the fruit, which was green in spring, gets quite ripe. England has had thirty-two kings, besides three queens. The kings' names are William the First, who built the Tower of London, and made Doomsday-Book. He also made a law which divided the land between earldoms, knights, and baronets. William the Second was killed by an arrow whilst he was hunting in the New Forest. He built Westminster Abbey for his dining-room, which was two hundred feet long. He reigned thirteen years. He was the brother of three other boys, the youngest of whom died young. His father ascended the throne in 1066. Henry the First reigned twenty-one years. Oliver Cromwell had a son. The queen who is now reigning is named Victoria. Nothing has yet happened in her reign but the rebellion of Canada. Viscount Lord Melbourne is her favourite minister.—F. J."

A WORD OF ADVICE TO YOUNG LADIES.

[We find the following admirable paper in the New York Mirror, April 18, 1840, in which it is stated to be a selection from a popular work by Mrs Farrar. It abounds in good sense, and we recommend it to the careful perusal of our young female readers.]

WHAT a pity it is that the thousandth chance of a gentleman's becoming your lover should deprive you of the pleasure of a free, unembarrassed, intellectual intercourse with all the single men of your acquaintance! Yet such is too commonly the case with young ladies who have read a great many novels and romances, and whose heads are always running on love and lovers.

Some one has said, that "matrimony is with women the great business of life, whereas with men it is only an incident"—an important one, to be sure, but only one among many to which their attention is directed, and often kept entirely out of view during several years of their early life. Now, this difference gives the other sex a great advantage over you; and the best way to equalise your lot, and become as wise as they are, is to think as little about it as they do.

The less your mind dwells upon lovers and matrimony, the more agreeable and profitable will be your intercourse with gentlemen. If you regard men as intellectual beings, who have access to certain sources of knowledge of which you are deprived, and seek to derive all the benefit you can from their peculiar attainments and experience—if you talk to them as one rational being should with another, and never remind them that you are candidates for matrimony—you will enjoy far more than you can by regarding them under that one aspect of possible future admirers and lovers. When that is the ruling and absorbing thought, you have not the proper use of your faculties; your manners are constrained and awkward, you are easily embarrassed, and made to say what is ill-judged, silly, and out of place; and you defeat your own views by appearing to a great disadvantage.

However secret you may be in these speculations, if you are continually thinking of them, and attaching undue importance to the acquaintance of gentlemen, it will most certainly show itself in your manners and conversation, and will betray a weakness that is held in especial contempt by the stronger sex.

Since the customs of society have awarded to man the privilege of making the first advance towards matrimony, it is the safest and happiest way for woman to leave the matter entirely in his hands. She should be so educated as to consider that the great end of existence—preparation for eternity—may be equally attained in married or single life, and that no union but the most perfect one is at all desirable. Matrimony should be considered as an incident in life, which, if it come at all, must come without any contrivance of yours, and therefore you may safely put aside all thoughts of it till some one forces the subject upon your notice by professions of a particular interest in you.

Lively, ingenuous, conversable, and charming little girls, are often spoiled into dull, bashful, silent young ladies, and all because their heads are full of nonsense about beaux and lovers. They have a thousand thoughts and feelings which they would be ashamed to confess, though not ashamed to entertain; and their pre-occupation with a subject which they had better let entirely alone, prevents their being the agreeable and rational companions of the gentlemen of their acquaintance which they were designed to be.

Girls get into all sorts of scrapes by this undue preoccupation of mind; they misconstrue the commonest attentions into marks of particular regard, and thus nourish a fancy for a person who has never once thought of them but as an agreeable acquaintance. They lose the enjoyment of a party, if certain beaux are not there whom they expected to meet; they become jealous of their best friends, if the beaux are there, and do not talk to them as much as they wish; every trifle is magnified into something of importance—a fruitful source of misery—and things of real importance are neglected for chimeras. And all this gratuitous pains-taking defeats its own ends! The labour is all in vain; such girls are not the most popular; and those who seem never to have thought about matrimony at all, are sought and preferred before them.

We have been shown, in the most striking manner, by Miss Edgeworth, how "manœuvring" to get husbands defeats its own aims in the old country; and its want of success here is even more complete. Where there is a fair chance of every woman's being married who wishes it, the more things are left to their natural course the better. Where girls are brought up to be good daughters and sisters, to consider the developement of their own intellectual and moral natures as the great business of life, and to view matrimony as a good, only when it comes unsought, and marked by such a fitness of things, inward and outward, as shows it to be one of the appointments of God, they will fully enjoy their years of single life, free from all anxiety about being established, and will generally be the first sought in marriage by the wise and good of the other sex; whereas those who are brought up to think the great business of life is to get married, and who spend their lives in plans and manœuvres to bring it about,

are the very ones who remain single, or, what is worse, make unhappy matches. * * * *

How strange a thing it is, in the constitution of English and American society, that the subject, of all others the most important and the most delicate, should be that on which every body is most given to joke and banter their friends. Much mischief has been done by this coarse interference of the world in what ought to be the most private and sacred of our earthly concerns; and every refined, delicate, and high-minded girl, should set her face against it, and, by scrupulously refraining from such jokes herself, give no one a right to indulge in them at her expense.

Well-educated girls have a wide range of topics, which afford plenty of agreeable and useful discussion between them and their gentlemen friends; and it is much better to talk with them, and with your female friends, of things and of people—of books, pictures, and the beauties and wonders of nature—than of Miss A——'s spoiled complexion, or Mr B——'s broken engagement, or the quarrel between C—— and D——. If you are familiar with the works of great minds, and spend much time in reading them, or if you love nature and scientific researches, you need not be told to avoid gossip, you will have no relish for it. If not possessed of much mental cultivation, you may yet find topics enough without talking of people; and it is so difficult to do that, without sinning against truth or charity, that it is best to avoid it whenever you can.

SKETCHES OF SUPERSTITIONS.

WITCHCRAFT IN SCOTLAND.

The mania respecting witchcraft—for such it might be called—which sprang up into vigour throughout southern Europe in consequence of the edicts of Innocent and Leo, spread in time to Scotland, and acquired strong possession of the public mind during the reign of Queen Mary. At that period, an act was passed by the Scottish parliament for the suppression and punishment of witchcraft; but this only served, as the papal bulls had done, to confirm the people in their maniacal credulity, and to countenance and propagate the general delusion. In terms of these ill-judged statutes, great numbers of persons, male as well as female, were charged with having intercourse with the devil, convicted, and burned on the Castlehill of Edinburgh and elsewhere. This continued during the earlier part of the reign of James VI., whose mind, unfortunately for the more aged of the female part of his subjects, was deeply impressed with the flagrant nature of the crime of witchcraft. In 1590, James, it is well known, made a voyage to Denmark to sea, marry, and conduct home in person, his appointed bride, the Princess Anne. Soon after his arrival, a tremendous witch conspiracy against the happy conclusion of his homeward voyage was discovered, in which the principal agents appeared to be persons considerably above the vulgar. One was Mrs Agnes Sampson, commonly called the *Wise Wife of Keith* (Keith being a village in East Lothian), who is described as "grave, matron-like, and settled in her answers." On this occasion, the king was induced by his peculiar tastes to engage personally in the business of judicial investigation. He had all the accused persons brought before himself for examination, and even superintended the tortures applied to them to induce confession. The statements made by these poor wretches form a singular tissue of the ludicrous and horrible in intimate union.

"The said Agnis Sampson was after brought again before the king's majestie and his councill, and being examined of the meetings and detestable dealings of those witches, she confessed, that upon the night of All-Hallow-even she was accompanied, as well with the persons aforesaid, as also with a great many other witches, to the number of two hundred, and that all they together went to sea, each one in a riddle, or sieve, and went in the same very substantially, with flaggons of wine, making merrie and drinking by the way in the same riddles, or sieves, to the Kirk of North-Berwick, in Lothian, and that after they had landed, took hands on the land, and danced this reil, or short daunce, singing all with one voice,

> 'Commer, goe ye before, commer, goe ye;
> Gif ye will not goe before, commer, let me.'

At which she confessed that Geillis Duncan did goe before them, playing this reil or dannce upon a small trump, called a Jew's harp, until they entered into the Kirk of North-Berwick. These made the king in a wonderful admiration, and he sent for the said Geillis Duncan, who upon the like trump did play the said daunce before the king's majestie, who, in respect of the strangeness of these matters, took great delight to be present at their examinations."

In the sequel of Agnes Sampson's confession we find some special reasons for the king's passionate liking for these exhibitions, in addition to the mere love of the marvellous. The witches pandered to his vanity on all occasions, probably in the vain hope of mitigating their own doom. Agnes Sampson declared that one great object with Satan and his agents was to destroy the king; that they had held the great North Berwick convention for no other end; and that they had endeavoured to effect their aim on many occasions, and particularly by raising a storm at sea when James came across from Denmark. "The witches demanded of the divell why he did beare such hatred to the king? who answered, by reason the king is the greatest enemie hee hath in the world." Such an eulogy, from such a quarter, could not but pamper the conceit of "the Scottish Solomon."

The following further points in the deposition of Agnes Sampson are worthy of notice. "*Item*, She went with the witch of Carrieburn, and other witches, to the kirk of Newton, and taking up dead folks and jointing them [cutting off fingers, &c.], made enchanted powders for witchcraft. *Item*, She went with other witches in a boat, the devil going before them like a rock of hay. *Item*, The devil, in the shape of a dog, gave her responses concerning her laird's recovery, and endeavoured to put awa ane of the ladies' daughters. *Item*, She raised a universal great storm in the sea when the queen was coming to Scotland, and *wrote a letter* to that effect to a witch in Leith. *Item*, She used this prayer in the healing of sickness:—

> All kinds of ill that ever may be, &c.

The repetition of these and such like verses by the confessing witches, has been matter of frequent surprise. But it must be remembered that a code of witchcraft, extensively known and accredited, existed at that day, regular forms and rules for its exercise having been laid down in the course of time. It must be recollected, also, that these poor creatures, though guiltless of all supernatural intercourse, had really pretended to the gift of healing by charms and incantations in many cases, and had to invent or learn formulas for the purpose. Besides, we find these doggrel scraps chiefly in the revelations of Agnes Sampson. She, it is stated, could write, and of course could read also; and hence she is to be regarded as a person who had had superior opportunities for acquiring a knowledge of the witchcraft code, as well as superior capabilities for filling up deficiencies on the spur of the moment. In her confession she implicated one Doctor Fian, otherwise called John Cunningham, master of the school at Saltpans, in Lothian, a man whose story may be noticed at some length, as one of the most curious and instructive in the whole annals of Scottish witchcraft.

Mrs Sampson deposed that Dr Fian was always a prominent person at the witch-meetings, and Geillis Duncan, the marvellous trump-player, confirmed this assertion. Whether made through heedlessness or malice, these averments decided Fian's fate. He was seized, and after being "used with the *accustomed paine* provided for those offences inflicted upon the rest, first, by *drawing of his head with a rope*, whereat he would confesse nothing;" and, secondly, being urged "by fair meanes to confesse his follies," which had as little effect; "lastly, hee was put to the most severe and cruell paine in the world, called the bootes, when, after he had received three strokes, being inquired if he would confesse his actes and wicked life, his tongue would not serve him to speake; in respect whereof, the rest of the witches willed to search his tongue, under which was founde two pinnes thrust up into the heade, whereupon the witches did say, now is the charme stinted, and shewed that those charmed pins were the cause he could not confesse any thing; then was he immediately released of the bootes, brought before the king, and his confession was taken." Appalled by the cruel tortures he had undergone, Fian seems now only to have thought how he could best get up a story that should bring him to a speedy death. He admitted himself to be the devil's "register," or clerk, who took the oaths from all witches at their initiation, and avowed his having bewitched various persons. In proof of the latter statement he instanced the case of a gentleman near Saltpans, whom he had so practised upon, he said, that the victim fell into fits at intervals. This person, who seems to have been either a lunatic or afflicted with St Vitus's dance, was sent for, and "being in his majestie's chamber, suddenly hee gave a great scritch, and fell into madnesse, sometimes bending himself, and sometimes casting so directly up, that his heade did touch the seeling of the chamber, to the great admiration of his majestie." On these and other accounts Dr Fian was sent to prison, but he contrived soon after to escape from it. "By meanes of a hot and harde pursuite," he was retaken, and brought before the king, to be examined anew. But the unfortunate man had had time to think, and, like Cranmer under somewhat similar circumstances, resolved to retract the admissions which the weakness of the body had drawn from him, and to suffer any thing rather than renew them. He boldly told this to the king; and James, whom these records make us regard with equal contempt and indignation, ordered the unfortunate man to be subjected to the following most horrible tortures. "His nailes upon all his fingers were riven and pulled off with an instrument called in Scottish a turkas, which in England are called a payre of pincers, and under everie nayle these was thrust in two needles over, even up to the heades; at all which tormentes, notwithstanding, the doctor never shrunk a whit, neither would he then confesse it the sooner for all the tortures inflicted on him. Then was hee, with all convenient speed, by commandement, convaied again to the torment of the bootes, wherein he continued a long time, and did abide so many blowes in them, that his legges were crusht and beaten together as small as might bee, whereby they were made unserviceable for ever." Notwithstanding all this, such was the strength of mind of the victim, or, as King James termed it, "so deeply had the devil entered into his heart," that he still denied all, and resolutely declared that "all he had done and said before was only done and said for fear of the paynes which he had endured." As, according to this fashion of justice, to confess or not to confess was quite the same thing, the poor schoolmaster of Saltpans was soon afterwards strangled, and then burned on the Castlehill of Edinburgh (January 1591).

Much about the same time that Agnes Sampson made her confessions, some cases occurred, showing that witchcraft was an art not confined to the vulgar. A woman of high rank and family, Catharine Ross, Lady Fowlis, was indicted at the instance of the king's advocate for the practice of witchcraft. On inquiry it was clearly proved that this lady had endeavoured, by the aid of witchcraft and poisons, to take away the lives of three or more persons who stood between her and an object she had at heart. She was desirous to make young Lady Fowlis possessor of the property of Fowlis, and to marry her to the laird of Balnagown. Before this could be effected, Lady Fowlis had to cut off her sons-in-law, Robert and Hector Munro, and the young wife of Balnagown, besides several others. Having consulted with witches, Lady Fowlis began her work by getting pictures of the intended victims made in clay, which she hung up, and shot at with arrows shod with flints of a particular kind, called elf-arrow heads. No effect being thus produced, this really abandoned woman took to poisoning ale and dishes, none of which cut off the proper persons, though others who accidentally tasted them lost their lives. By the confession of some of the assistant hags, the purposes of Lady Fowlis were discovered, and she was brought to trial; but a local or provincial jury of dependents acquitted her. One of her purposed victims, Hector Munro, was then tried in turn for conspiring with witches against the life of his brother George. It was proved that a curious ceremony had been practised to effect this end. Hector, being sick, was carried abroad in blankets, and laid in an open grave, on which his foster-mother ran the breadth of nine riggs, and, returning, was asked by the chief attendant witch, "which she chose should live, Hector or George?" She answered, "Hector." George Munro did die soon afterwards, and Hector recovered. The latter was also acquitted, by a provincial jury, on his trial.

These disgraceful proceedings were not without their parallel in other families of note of the day. Euphemia Macalzean, daughter of an eminent judge, Lord Cliftonhall, was burned at the stake in 1591, having been convicted, if not of witchcraft, at least of a long career of intercourse with pretenders to witchcraft, whom she employed to remove obnoxious persons out of her way—tasks which they accomplished by the very simple means of poisoning, where they did accomplish them at all. The jury found this violent and abandoned woman, for such she certainly was, guilty of participation in the murder of her own godfather, of her husband's nephew, and another individual. They also found her guilty of having been at the Wise Woman of Keith's great witch-convention of North Berwick; but every witch of the day was compelled to admit having been there, out of compliment to the king, to whom it was a source of agreeable terror to think himself of so much importance as to call for a solemn convocation of the powers of evil to overthrow him. Euphemia Macalzean was "burnt in assis, *quick*, to the death." This was a doom not assigned to the less guilty. Alluding to cases of this latter class, a writer (already quoted) in the Foreign Quarterly Review remarks, "In the trials of Bessie Roy, of James Reid, of Patrick Currie, of Isobel Grierson, and of Grisel Gardiner, the charges are principally of taking off and laying on diseases either on men or cattle; meetings with the devil in various shapes and places; raising and dismembering dead bodies for the purpose of enchantments; destroying crops; scaring honest persons in the shape of cats; taking away women's milk; committing housebreaking and theft by means of enchantments, and so on. South-running water, salt, rowan-tree, enchanted flints (probably elf-arrow heads), and doggrel verses, generally a translation of the creed or Lord's Prayer, were the means employed for effecting a cure." Diseases, again, were laid on by forming pictures of clay or wax; by placing a dead hand, or some mutilated member, in the house of the intended victim; or by throwing enchanted articles at his door. A good purpose did not save the witch; intercourse with spirits, in any shape, being the crime.

Of course, in the revelations of the various witches, inconsistencies were abundant, and even plain and evident impossibilities were frequently among the things averred. The sapient James, however, in place of being led by these things to doubt the whole, was only strengthened in his opinions, it being a maxim of his, that the witches were "all extreme lyars." Other persons came to different conclusions from the same premises, and before the close of James's reign, many men of sense began to weary of the torturings and incremations that took place almost *every day*, in town or country, and had done so for a period of thirty years (betwixt 1590 and 1620). Advocates now came forward to defend the accused, and in their pleadings ventured even to arraign some of the received axioms of "Daemonologie" laid down by the king himself, in a book bearing that name. The removal of James to England moderated, but did not altogether stop, the witch prosecutions. After his death they slackened

Digitized by Google

more considerably. Only eight witchcraft cases are on the Record as having occurred between 1625 and 1640 in Scotland, and in one of these cases, remarkable to tell, the accused escaped. The mania, as it appears, was beginning to wear itself out.

As the spirit of puritanism gained strength, however, which it gradually did during the latter part of the reign of Charles I., the partially cleared horizon became again overcast, and again was this owing to ill-judged edicts, which, by indicating the belief of the great and the educated in witchcraft, had the natural effect of reviving the frenzy among the flexible populace. The General Assembly was the body in fault on this occasion, and from this time forward the clergy were the great witch-hunters in Scotland. The Assembly passed condemnatory acts in 1640, 43, 44, 45, and 49, and with every successive act, the cases and convictions increased, with even a deeper degree of attendant horrors than at any previous time. "The old impossible and abominable fancies," says the review formerly quoted, "of the *Malleus* were revived. About thirty trials appear on the Record between 1649 and the Restoration, only one of which appears to have terminated in an acquittal; while at a single circuit, held at Glasgow, Stirling, and Ayr, in 1659, seventeen persons were convicted and burnt for this crime." But it must be remembered that the phrase "on the Record" alludes only to justiciary trials, which formed but a small proportion of the cases really tried. The justiciary lists take no note of the commissions perpetually given by the Privy-Council to resident gentlemen and clergymen to try and burn witches in their respective districts. These commissions executed people over the whole country in multitudes. Wodrow, Lamont, Mercer, and Whitelocke, prove this but too satisfactorily.

The clergy continued, after the Restoration, to pursue these imaginary criminals with a zeal altogether deplorable. The Justiciary Court condemned twenty persons in the first year of Charles II.'s reign (1661), and in one day of the same year the council issued fourteen new provincial commissions, the aggregate doings of which one shudders to guess at. To compute their condemnations would be impossible, for victim after victim perished at the stake, unnamed and unheard of. Morayshire became at this particular period the scene of a violent fit of the great moral frenzy, and some of the most remarkable examinations signalising the whole course of Scottish witchcraft took place in that county. The details, though occasionally ludicrous from their absurdity, are too horrible for narration in the present pages.

The popular frenzy seems to have exhausted itself by its own virulence in 1661–62, for an interval of six years subsequently elapsed without a single justiciary trial for the crime of witchcraft, and one fellow was actually whipped for charging some person with it. After this period, the dying embers of the delusion only burst out on occasions, here and there, into a momentary flame. In 1678, several women were condemned, "on their own confession," says the Register; but we suspect this only means, in reality, that one malicious being made voluntary admissions involving others, as must often have been the case, we fear, in these proceedings. Scattered cases took place near the beginning of the eighteenth century, such as those at Paisley in 1697, at Pittenweem in 1704, and at Spott about the same time. It is curious, that, as something like direct evidence became necessary for condemnation, that evidence presented itself, and in the shape of possessed or enchanted young persons, who were brought into court to play off their tricks. The most striking case of this nature was that of Christian Shaw, a girl about eleven years old, and the daughter of Mr Shaw of Bargarran, in Renfrewshire. This wretched girl, who seems to have been an accomplished hypocrite, young as she was, quarrelled with a maid-servant, and, to be revenged, fell into convulsions, saw spirits, and, in short, feigned herself bewitched. To sustain her story, she accused one person after another, till not less than twenty were implicated, some of them children of the ages of twelve and fourteen! They were tried on the evidence of the girl, and five human beings perished through her malicious impostures. It is remarkable that this very girl afterwards founded the thread manufacture in Renfrewshire. From a friend who had been in Holland, she learnt some secrets in spinning, and, putting them skilfully in practice, she led the way to the extensive operations carried on in that department of late years. She became the wife of the minister of Kilmaurs, and, it is to be hoped, had leisure and grace to repent of the wicked misapplication, in her youth, of those talents which she undoubtedly possessed.

The last justiciary trial for witchcraft in Scotland was in the case of Elspeth Rule, who was convicted in 1708, and—banished. The last regular execution for the crime is said to have taken place at Dornoch in 1722, when an old woman was condemned by David Ross, sheriff of Caithness. But we fear the provincial records of the north, if inquired into, would show later deaths on this score. However, here may be held to end the tragical part of the annals of Scottish witchcraft. The number of its victims, for reasons previously stated, it would be difficult accurately to compute, but the black scroll would include, according to those who have most attentively inquired into the subject, upwards of FOUR THOUSAND persons! And by what a fate they perished! Cruelly tortured while living, and dismissed from life by a living death amid the flames! And for what? For an impossible crime! And who were the victims, and who the executioners? The victims, in by far the majority of cases, were the aged, the weak, the deformed, the lame, and the blind; those to whom nature had been ungentle in her outward gifts, or whom years and infirmities had doomed to poverty and wretchedness; exactly that class of miserable beings, in short, for whom more enlightened times provide houses of refuge, and endow charitable institutions, aiming, in the spirit of true benevolence, to supply to them that attention and support which nature or circumstances have denied them the power of procuring for themselves. Often, too, was the victim a person distinguished by particular gifts and endowments; gifts bestowed by the Creator in kindness, but rendered fatal to the possessor by man. These were the victims of witchcraft. The executioners were the wisest and greatest of their time. Men distinguished above their fellows for knowledge and intelligence, ministers of religion and of the laws, kings, princes, and nobles—these and such as these judged of the crime, pronounced the doom, and sent the poor victims of delusion to the torture, the stake, and the scaffold.

VEGETABLE PHENOMENA.

THE following notice of a lecture on this interesting subject, delivered a short time ago by Mr Murray to the members of the Birmingham Athenæum, appears in a late Birmingham paper:—

After a brief recapitulation of his previous lecture, Mr Murray noticed some important advantages which had resulted to man from a close examination of the structure and physiology of the products of vegetation. Amongst other interesting facts, he stated that the peculiar form and shape of the trunk of the oak imparted to Smeaton the idea of his wonderful structure, the Eddystone Lighthouse. He also adverted to the structure of floating breakwaters, which were exact copies from nature, being constructed on the principle exhibited in the forms of the white water-lily. In noticing incidentally the great height and diameter which particular trees sometimes attained, Mr Murray adverted to the great sycamore, or mammoth tree, from Salt River, bordering on Kentucky and Indiana. The inner portion of this giant tree, which is supposed to be some thousand years old, had long since decayed, and there were large apertures in it which were used as doorways. Before cutting, it measured seventy-two feet in circumference near the base, and five or six years previously, when in a more perfect state, it measured considerably more. Amongst other extraordinary circumstances connected with the history of this tree, probably the largest ever grown on the American continent, it is stated that it frequently served as a shelter for parties of travellers with their teams, and that seventeen horses have been stabled in it at one time. Amongst examples of the opposite extreme exhibited in the productions of the vegetable kingdom, he noticed the cabbage palm of tropical climates, which sometimes reached an altitude of 200 feet, with a stem not exceeding four inches in circumference; while some pines had been found to attain a height of 400 feet. The lecturer next proceeded to describe that beautiful portion of the plant, the blossom, and the mechanism exhibited in the opening and shutting of flowers, in connection with the temperature and hygrometry of the atmosphere. Many flowers closed at the decline of day, and remained shut during night; while others changed their hues so rapidly, that the artist who attempted to make a copy from nature was obliged to wait the return of successive days, in order to depict a particular colour. The *hibiscus mutabilis* unfolded its blossoms green in the morning; they afterwards changed to white; about noon they became red; and in the evening they changed to a rose tint or a crimson. All these changes had been found to be connected with the varying temperature of the atmosphere. The distribution of colour would, therefore, be found to possess its geography on the surface of the globe. White and blue flowers prevailed as we advanced to the polar regions; "cloth of gold" arrayed temperate climes; and a vermilion livery clothed "the land of the sun" between the tropics. Each colour, too, had its particular season. White and blue prevailed in spring, scarlet in summer, and the autumn had its "sere and yellow leaf." The lecturer here incidentally adverted to the theory of some botanists who contended that flowers were merely metamorphosed leaves, observing, that the doctrine of "morphology," as it was called, was totally irreconcilable with sound logic or common sense. The independence of flowers and leaves could not be controverted. The aloe was a milk-white sheet of blossom before the leaves appeared, and the almond tree blossomed before the foliage expanded. The hazel, too, displayed the pendant ensigns of its catkins while the leaves yet remained rolled up in the cerements of the buds. The truth was, that the offices and functions of leaves were altogether different. In glancing at the interesting phenomenon, the chronometry of vegetation, or the opening and shutting of plants at particular hours, Mr Murray mentioned the case of the *ornithologalum umbellatum*, which expanded its flowers in Paris at eleven o'clock. The same interesting and curious phenomenon was also witnessed in the economy of the seed-vessels and the seeds, the circumstances connected with the ventilation, maturation, and preservation of which embraced a world of wonders in itself. Some fruits, seed-vessels, or cases, were of immense growth and weight, as an instance of which the lecturer mentioned that he had seen a mammoth gourd, which weighed 180 lbs. Some seeds were found to be enveloped in silk, others in cotton and down—protection from moisture, and insulation in reference to variable temperatures, appearing to be the design connected with these remarkable provisions. The seeds of particular plants were also provided with wonderful apparatus for conveying them to the locality congenial to their germination and growth; and for this purpose some were furnished with wings, which carried them through the air to a great distance. As an example of this description of seeds, it would be sufficient to mention those of the mahogany and *bignonia grandiflora*. Some seeds also possessed elastic balls, or balloons, to aid their transport through the air, and ensure their proper contact with the earth; the bladder nut was provided with two cells, one of which was inflated with air, while the other contained the seed, and by its weight descended on that side towards the earth. There were other plants which actually planted their own seeds, the tips of the branches to which the seed pods were attached gradually bending towards the earth, and forcing the seeds into the ground. The falling seeds of the "cannon-ball tree," which flourished in tropical climates, as they rebounded from the earth, sounded through the forest like the running fire of musketry; and the balls, which were perfectly spherical, presented the appearance as if military had bivouacked around the spot. In the seed-vessels of the *hermandia sonora*, there was a circular orifice below, and the seeds were disposed at intervals within, so that as the breeze whistled through spaces between the seeds, the tree became vocal, and was known to the negroes of the West India islands by the familiar name of "Jack in the Box." A friend of his had informed him that there was a valley in Barbadoes called, from the number of these trees which it contained, "The valley of Jack in the Box," and that he had often sat at its entrance listening with delight to these natural Æolian harps, strung among the branches, as the zephyrs flattered in the woods or swept between the hills.

VIEW OF A CLASSICAL SCHOOL.

THE extent to which classical education, as it is called, has long been carried in this country, to the almost entire exclusion of instruction of every other kind, has been more than once commented on in this periodical, and the injurious consequences of the practice pointed out. While admitting the standard writings of Greece and Rome to be fair adjuncts to an elegant education, or, in other words, to constitute an agreeable branch of the belles lettres, the custom of imbuing the mind of youth with that species of knowledge alone, and neglecting all those departments of it calculated to be of use in after-life, was reprobated as alike absurd and deleterious. If, in common with many able contemporaries, we held this opinion formerly, we must say, that something has recently fallen under our eye, which confirms it, and indeed doubles its strength. Lighting on a past number of the Quarterly Journal of Education, we there found a sketch of the daily and sessional business of one of the most ancient and distinguished schools of England. It was originally founded by a man of large property, whose purpose was to make it a free school, for the benefit of the youth of the parish in which it is situated; but the very liberality of the founder had the effect, in the course of time, of rendering the school a fashionable one, and unfitting it as a place of instruction for any but the children of the richer orders. Masters of the very highest eminence for scholarship were secured by the amplitude of the funds, and the consequence was the progressive influx of the children of the nobility and people of rank, whose attendance at the seminary was in a great measure incompatible with that of the poorer orders. The school, in short, is now almost exclusively one for the youth of the nobility and gentry of England.

And what *is* here taught to the youth of the English nobility and gentry—those to whom the country is to look for its legislators, rulers, peers, and prelates—those in whose hands is hereditarily vested the bulk of the soil of England, and who consequently have under their control the fortunes and comforts of a vast portion of their fellow-countrymen—what is taught, at the school in question, to this most important class? Do we find them imbued with a knowledge of the past history of their own country, and enlightened as to the modes of government which have injured or benefited it? Do we find them anxiously instructed in all that relates to its commerce, on which its welfare so largely depends? Do we find their attention called to those wonders of science, practical and speculative, which have raised it to the first place among the nations, and the farther development of which must exert so great an effect on its future interests? Do we find them, in short, trained in such a way as becomes those who are to be the first men in a great country, to be its legislators and guides in an age of knowledge and improvement, and to serve as the skilful guardians of its many interests?

For centuries, the course of education at this school has been, and at this day is, something very different indeed from the training to which these interrogatories point. By quoting the daily business of the *forms* or classes, we shall enable our readers to judge for themselves. Here is the weekly or six days' business of the sixth form, the highest or most advanced in the school. "MONDAY.—Repetition of Friday's *Horace*, Satires or Epistles, 50 lines; *Latin lyrics* or *Greek verse* of Thursday looked over—hour for this half-past 7 A.M. *Horace's odes*, 60 or 70 lines—hour 11 to 12. *Homer's Iliad*, 50 lines; rest of hour, *Euclid*—hour 3 to 4. *Roman history*, one page—hour 5 to 6. TUESDAY is a whole holiday as respects the school; but exercises and private reading with the assistant masters (all upon the same subjects) go on during the day. WEDNESDAY.—Repetition of Friday's *Greek play*, 30 lines; *verses* of Friday looked over—hour half-past 7. *Virgil's Æneid*, 50 lines—hour 11 to 12. *Euclid*, Vulgar Fractions, Decimals, or Logic

Digitized by Google

—hour 3 to 4. *Musa Græca* (Greek verse), 40 or 50 lines, according to author chosen; examination in a portion of *Greek* history which the boys have prepared —hour 5 to 6. THURSDAY.—Repetition of Monday's *Horace*, odes, 60 or 70 lines. Theme of Monday looked over—hour half past 7. *Thucydides*—hour 11 to 12. *Modern history*—hour half-past 12 to 1. FRIDAY.—Repetition of Wednesday's *Virgil*, 50 lines. *English essay* looked over—hour half-past 7. *Demosthenes*, alternating with *Philosophia Græca*—hour 11 to 12. *Greek play*, 50 lines—hour 3 to 4. *Horace*, Epistles or Satires. Examination in *Greek history*, as on Wednesday—hour 5 to 6. SATURDAY.—Part of a Gospel or Acts of Apostles. *Beausobre* on New Testament. General Scripture History—hour half-past 7. *Thucydides*, alternating with *Roman history*—hour 11 to 12."

This is the routine business of the school. Exercises are also set each day, and they are thus described in the work before us. "MONDAY.—*Latin Theme* or *Greek Prose* exercise. TUESDAY, ——. WEDNESDAY.—Translation from *Greek* or *Latin* prose into English, alternating with an *English Essay*. THURSDAY.—*Latin Lyrics*, alternating with *Greek verse*. FRIDAY.—*Latin verses*, hexameter, or hexameter and pentameter. SATURDAY, ——."

Thus, in the instructions given to the highest class in one of the most famous schools of Britain, we find but one *half hour* (Thursday) given to modern history! "One halfpenny worth of bread to all this intolerable deal of sack!" With the exception of a sprinkling of mathematics, all the rest is Latin and Greek, Greek and Latin, over and over again, without pause or change; for this one week, it must be remembered, is a fair specimen of the whole session. The religious reading included in the list has little other object than to teach the Latin and Greek scriptures. If an enlightened being from another sphere, with a mind totally unaffected by our historical partialities, were to step in amongst us, and examine the education given to the highest youth in the first country of the world, at an age the most improved in its annals, what would be his first feeling on observing the perpetual occupation of the pupils with Greek and Latin? Most certainly he would exclaim, "Ah! these languages must be very important in after-life, since so much time is expended in acquiring them. The power to talk them must be the great mean to honour and success in the world. There must be some great nations, with whom you have commercial intercourse, that speak these tongues?" "No," would be the reply; "the languages are disused at the present day; they are spoken by no people on the earth." "Indeed! then these tongues must contain immense stores of useful knowledge, accessible only by learning them." "No; all the knowledge they contain is of little or no value at this day, and, at all events, may be readily got at by translations. Besides, it is the poetry of these languages that is almost exclusively attended to at schools." "Poetry! all this time spent upon poetry! It at least must be of a very high order—must be full of fine morality, and inspire into the young mind such pure religious sentiments as will permanently improve the character, and so benefit society at large." "No; the poetry alluded to is filled with idolatrous absurdities, and stories of a most licentious character," &c.

This sort of questioning might go on to a great length, and we believe that the questioner would be foiled in every attempt to hit on any thing like a rational motive for the system of instruction pursued in our most approved seminaries for youth. We shall not, however, pursue the matter farther, but, in order to satisfy the reader that the specimen given of the routine business of the school in question is a fair one, we shall exhibit another form's weekly proceedings. "MONDAY.—Repetition of Greek and Latin Verse. Horace's Odes. Homer's Iliad. Roman History. TUESDAY, ——. WEDNESDAY.—Repetition.—Verses looked over. Virgil's Æneid. Greek Verse. Cornelius Nepos. THURSDAY.—Repetition. Theme looked over. Xenophon's Anabasis. FRIDAY.—Repetition and Translation looked over. Geography. Geography or Retranslation of Anabasis into Greek. Horace, Epistles or Satires. SATURDAY.—Repetition and Lyrics looked over. Greek Testament." The exercises for the same period are stated to be, "Latin Theme for Monday; English Translation from Latin for Wednesday; Latin Lyrics for Thursday; and Latin Verses, hexameters or elegiacs, for Friday."

Here again we find a little Geography on Friday to be really the only rational portion of instruction given to the pupils. Surely, this time-honoured folly must soon come to a close. Mankind have been so long blinded by habit, that they seem to have forgotten entirely for what end children are really sent to school, otherwise they never could suffer the instruction given to them to consist almost exclusively of things having no conceivable relation to the business of after-life, and conducing in not the slightest degree to their worldly success or happiness. In reality, however, light is now breaking in upon the subject, and we may ere long hope to see education assume universally a more rational character. The classical writings will take their due place as a branch, merely, of *elegant* education, and knowledge, truly practical and useful, be established in the position which they have so long been allowed to occupy.

As the account from which we have made the preceding extracts refers to the year 1831, the educational system of the school alluded to may have participated in the changes which have been spreading of late years among the seminaries of the country. We believe, that, to a certain extent, this has really been the case; but there are yet numberless other schools in Britain which pursue the old plan in all its pristine defectiveness.

PARKS—FIELDS.

IT is common to call a certain space of enclosed ground a *park*, but, properly speaking, this is wrong. An enclosure of ordinary dimensions, and possessing no royal privileges, is only a *field*. The words park and field are therefore as different in signification as village and city. The best explanation we can give of the true or legal meaning of the word *park*, is embraced in the following extract from Mr Wade's "Cabinet Lawyer." (Johnson, London, 1840.)

"Beside the absolute property, which the owner of the land possesses in right of the soil, a person may also have a qualified property in wild animals by grant of privilege; that is, he may have the privilege of taking or killing them in exclusion of other persons, in virtue of a franchise to have a forest, chase, warren, or park.

A *forest* is a royal domain for the preservation of the queen's beasts and fowls of forest, and is subject to its own laws, courts, and officers. Before the *Charta de Foresta*, the sovereign could make a forest of any extent over the lands of his subjects. It is the highest franchise relating to game; a free chase is the next in degree; a park the next; and the last a free warren. The number of forests is sixty-nine, of which the four principal are, New Forest on the Lea, Sherwood Forest on the Trent, Dean Forest on the Severn, and Windsor Forest on the Thames.

A *chase* is of a middle nature, between a forest and a park; it differs from the former in that it may be held by a subject, and is governed by the common, not the forest law; and from the latter, in that it is not enclosed. A man may have a chase over another's ground, with privilege to keep royal game therein, protected even from the owner of the land. It is said there are thirteen chases in England.

A *park* is an enclosed chase, extending only over a man's own land, privileged for wild beasts. There are only seven hundred and eighty parks; for it is not every field or common which a gentleman pleases to surround with a wall or paling, and to stock with a herd of deer, that is thereby made a *legal* park. To constitute it, three things are requisite. 1. A royal grant thereof. 2. Enclosure by pale, wall, or hedge. 3. Beasts of a park, such as the buck, doe, &c. And when all the deer are destroyed, it can no more be accounted a park: for a park consists of *vert*, *venison*, and *enclosure*; and if it is determined in any of them, it is a total disparking.

Free warren is a place privileged, by prescription or grant from the queen, for the keeping of beasts and fowls of the warren, which are hares and coneys, partridges, pheasants, and some add quails, woodcocks, and waterfowl. Twenty years undisturbed exercise of a claim of a warren or park, will afford presumptive evidence of right in the party so enjoying it. The owner of a warren may lawfully kill any dog which is used to hurt the warren.

The rights of any forest, chase, or warren, are not affected by the game act. All the franchises of the description mentioned above, having their origin in the crown, may be destroyed by a reversion to the crown, or by surrender, or forfeiture, in consequence of a breach of the trust upon which they were granted."

SPEAKING AND WRITING.

It frequently happens that what is a fault in a speaker, is a merit in a writer. If a speaker hesitates, and stops, and changes his constructions, and in the middle of a sentence breaks off to begin it again, because he sees a more forcible or happy mode of expression; or if he finds that the whole sentence is unnecessary, and that the meaning and force may be given better by a single word introduced in the former period, and therefore returns and repeats what he has just said, in order to interweave the additional word, he is condemned at once as a bad and repulsive speaker. In a writer, on the other hand, these qualities are equally valuable and rare. The celebrated German historian of Rome, Niebuhr, seldom attempted to speak extempore in public without breaking down in every other clause, and hesitating and repeating, as has been described. He rarely finished a sentence as he began it; he had no sooner uttered a clause, than he saw some better way of wording it, and this perplexed both himself and his hearers. The students would frequently laugh at him, and mock him for this peculiarity. Still he was eloquent: he excelled in the eloquence of particular words, of happy expressions, which were full of meaning. His style had all the pregnancy of Tacitus without his affectation. Although he restored antiquated words and forms of speech, he used them in their ordinary sense. His very *words* are *sententious*. It is said that he seldom sent a sentence to the press, which he had not altered three or four times.

BEING TAKEN UNAWARES.

A beggar who had tried many ways for increasing his finances, at last hit on the plan of pretending to be dumb. A gentleman who was passing by knew the beggar by sight, and going up to him, asked him promptly, "Pray, how long have you been dumb?" The beggar was taken unawares, and had no time to decide on not speaking, and answered quickly, "From my earliest youth." So, sudden or startling events seem to give the mind, as it were, a good shaking, and the truth comes out in spite of ourselves. We often say on the sudden a thing which, though perfectly true, nay, because of its truth perhaps, we should keep back, if we were at ease and not taken by surprise.

QUEBEC AND MONTREAL.

The signs of progression and of stationary habits are nowhere more strikingly conspicuous than at Quebec and Montreal; and nowhere, perhaps, are domestic contrasts of almost every kind exhibited in more varied shapes. Side by side are seen the modern commercial store and the ancient secluded convent. Here appears the harbour, enlivened by an array of British shipping; there, the lingering remnants of primitive inactive life. Jostling each other on the narrow causeway, or grouped in the wider square or market-place, are the red-coated soldier of England, and the cowled priest of France; the antiquated *habitant* of the country in his homespun suit of grey, and the spruce denizen of the town attired in the latest European fashion; the swarthy aborigine of the soil enveloped in his blanket, with his squaw carrying her *papoose* at her back (the little creature not *always* exhibiting in lineament a purity of race), and the British artisan or labourer in his peculiar garb; while, to crown the whole, the alternate sound of two conflicting languages breaking on your ear at every step you take, leaves you momentarily undecided as to whether you be not in some provincial town of France or England; the first impression, moreover, being strengthened by the general appearance of the streets and houses, and the last by the British designation of many of the thoroughfares, and the preponderance of British names along their line of frontage.—*Preston's Three Years in Canada.*

EARLY MARRIAGES.

Great as may be the inconveniences attending early marriages, they are not to be compared to those attending long engagements. The position of both parties is, in a manner, the reverse of that which they will respectively occupy in after-life. The lady commands, the gentleman obeys; and when this state of things has lasted for any length of time, it is no easy matter to restore them again to their natural state; for although no woman of sense, who respects her husband and herself, will ever wish to domineer, and no man of spirit would submit to it, yet the precise limits to which authority may fairly be extended on the one hand, and obedience expected on the other, are so ill-defined, that it requires very often great tact and management to adjust the balance; and this difficulty is naturally increased, when the parties have been for a long time playing directly contrary parts. Lovers, too, are naturally living in a state of complete deception and hypocrisy, in most cases probably quite unintentionally; but where there exists a strong desire to please, there must also necessarily exist a strong anxiety to keep one's faults in the background, and exhibit only the most pleasing part of one's character. Half the unhappiness that exists in married life is, I believe, to be attributed to the discoveries that are constantly making of the great difference of dispositions before and after marriage. Then come accusations of deception—very unfairly, for, as I before said, the fraud was an involuntary one, and inherent in human nature; accusations are followed by recriminations, and all the misery and bitterness of married strife, merely because the lovers expected to marry angels, and find out that they are united to human beings like themselves.—"*Arundel*," *by Sir Francis Vincent.*

ROBBERY BY A BIRD.

A respectable sheep-farmer near Fort Augustus, has sent to us a communication, of which the following is the substance. After a walk over his farm, at the beginning of this year's lambing season, and on a very warm morning, he had fallen asleep on a high hill. On awakening, he found that his broad blue bonnet, and a yellow silk handkerchief which he had placed beside him, were both amissing. At first he suspected that they had been taken away in sport by some person on the farm; but, on inquiry, every individual on the farm and neighbourhood, who could possibly have approached the spot, denied all knowledge of the missing articles. Some weeks thereafter, our correspondent and a party ascended a very steep and dangerous rock on the farm, to destroy the nest of a *glede*. Great was his amazement when the first article taken out of the nest was the missing yellow silk handkerchief; then the broad blue bonnet, with three eggs most comfortably ensconced in it; next appeared an old tartan waistcoat, with tobacco in one pocket, and Orr's Almanac for 1839 in the other (the almanac having the words, barely legible, "J. Fraser" written upon it); then came a flannel nightcap, marked with red worsted, "D. C. J."; a pair of old white mittens; a piece of a letter with green wax, and the Inverness post-mark; an old red and white cravat; and a miscellaneous assortment of remnants of cotton, paper, rope, &c. This bird must have been carrying on its larcenies on a large and miscellaneous scale. The affair rivals the maid and magpie of dramatic celebrity, and may be taken by some Sir Malachi Malagrowther as a link in the chain of evidence to prove the increase of crime in the Highlands, "consequent on the passing of the Reform Act." We may guard against depredators on foot; but how are we to protect ourselves against those on wing? We commit this delinquent and his species to the vigilant surveillance of the proposed new police constabulary force.—*Inverness Courier.*

A SOUND ADVICE.

It is certainly a great disparagement to virtue, and learning itself, that those very things which only make men useful in the world, should incline them to leave it. This ought never to be allowed to good men, unless the bad had the same moderation, and were willing to follow them into the wilderness. But if one shall contend to get out of employment, while the other strives to get into it, the affairs of mankind are like to be in so ill a posture, that even the good men themselves will hardly be able to enjoy their very retreat in security.—*Life of Cowley.*

NUMBER 443. SATURDAY, JULY 25, 1840. PRICE THREE HALFPENCE.

A FEW WEEKS FROM HOME.

THE ELECTRIC TELEGRAPH.

JUNE, in London, is the most fashionably busy season of the year. Every body is in town. The Houses are sitting. All the places of public amusement are open. Epsom races—that admirable national engine for improving the breed of horses and deteriorating the race of men—come on in all their glory. And now generally occur those meetings of an important nature which attract strangers from all quarters of the united kingdom. This, then, is one of the most agreeable months in the year for visiting the metropolis, and it was on one of its finest evenings that, having arrived from the north at the railway station in Euston Square, we were whirled in a cab through the dusty streets to the domicile hospitably opened for our reception.

The following sketches of what fell under my observation during a short stay in town, may perhaps serve to amuse a leisure hour of that class of readers who, by circumstances, are shut out from personally visiting the scenes of my inquiry.

One evening, shortly after my arrival in London, I had the pleasure of meeting Professor Wheatstone at the house of a mutual friend, along with fifteen or twenty other gentlemen, all in some manner distinguished by their scientific or literary abilities. I cannot say that I remember having ever spent a few hours more agreeably. The company, besides being eminent in their respective lines of pursuit, were all, less or more, the friends of an advancing intelligence, or at least did not belong to the formidable order of retarders. I was particularly delighted with the opportunity of knowing Professor Wheatstone personally, and of conversing with him on a subject of experimental philosophy in which he is known to be engaged, and which, indeed, he may be said to have already made his own; I allude to that very surprising result of human ingenuity operating on a mysterious principle in nature —the *electric telegraph*. With much kindness, the professor invited me to attend a private exhibition of the apparatus and its operations on the ensuing Saturday, at King's College. As may be supposed, I readily accepted the offer; and if the reader pleases, he shall accompany me along the Strand to the lecture-room on the day in question.

The professor was present, with an assistant, while the apparatus required in the experiments lay before and around him on tables, or hung on the wall at his side. The electric telegraph, it is essential to explain, is a means of transmitting any piece of intelligence, through the medium of wires, to any assignable distance, by night or by day, and in a moment of time. The wires do not move, or are in any way drawn, neither do they emit any sound. They lie perfectly still and quiescent, and the transmission is effected simply by electric or galvanic influence, passing along invisibly from one extremity to the other. The transmission of an electric shock through a wire, or any other metallic body, is well understood, and there must be few who are not acquainted with the instantaneous manner in which it acts; the only thing peculiar, therefore, in the present matter, is causing the shock to affect a moveable object at the extremity of the wire, and so produce a certain telegraphic sign. The production of signs by galvanic shocks, may on this account be defined as the principle on which this new species of communication is made to act.

The discovery of this kind of telegraphic action is by no means new. From a passage in Arthur Young's Travels in France, published in 1787, it appears to have been at that period known, and to some extent practised by a M. Lomond. But like many other remarkably ingenious devices—gas-lighting and steam-boating, for example—it was long in being heard of popularly after science had established its capabilities. Even now, it is one of those practical improvements which, to a certain extent, remain under public suspicion. Twelve years ago, Dr Ritchie made some attempts to complete the plan of an electric telegraph; Sir Humphry Davy and others also engaged in a similar undertaking. In 1837, the model of an apparatus for communicating by galvanic action, was exhibited by Mr Alexander before the Society of Arts in Edinburgh; and this, as far as I know, was the first time the thing was brought in a tangible form before the public. Mr Alexander's telegraph was in the form of a chest, containing thirty copper wires, answering to the twenty-six letters of the alphabet, three points, and an asterisk to denote the termination of a word. At one end, in connexion with the wires, were keys like those of a piano-forte, and underneath these were a pair of plates, zinc and copper, forming a galvanic trough: at the other extremity of the wires were thirty steel magnets, and, any one of these being affected by the electric agency produced by touching the key, it was turned to the right or left, and unveiled a particular letter. On removing the finger from the key, the magnet sprung back, and the letter was screened from observation. Thus any letter could be instantaneously exposed, or words spelled letter by letter, according to the will of the operator. As galvanism requires a complete circuit for its operation—that is, a wire must not only go from but return to the trough where it receives its influence—it might be supposed that a duplication of the thirty wires would have been necessary, but by a happy arrangement of Mr Alexander, with one return wire to serve for all, this encumbering of the apparatus was avoided.

Since this time, considerable improvements have been effected on the mechanism of electric telegraphs, chiefly by Professor Wheatstone, one material object having been the reduction of the number of wires, which has been effected with a surprising degree of skill. The professor has spent several laborious years, and, as is understood, some thousands of pounds, in perfecting the apparatus. In the early stage of the discovery, he effected a patent for a particular mode of operating, but that, though possessing very remarkable powers, he has some time ago superseded by one much more simple, and which I can see no reason for not immediately coming into general use.

On the occasion of my visit, to which I must now return, the professor showed two varieties of the apparatus, one being the latest invention, and the most deeply interesting from its simplicity. It may be briefly described as consisting of two small galvanic troughs or batteries; four lengths of copper wire; an object resembling a brass clock, with a small opening or dial on the surface sufficient to show a single letter at a time; close by this case of mechanism stood an upright pivot of brass about three inches high, having a circular top inscribed with the letters of the alphabet all round, and from each letter a spike pointing outwards like the spokes from a capstan. The whole stood on a table, except the wires, which, being four miles in length, and warped in numerous convolutions through the vaults of the college, were observable only at their extremities in connexion with the apparatus.

I need not confuse the reader by attempting an explanation of the principle of the process, which has been already adverted to; it will suffice to state, that the electricity or galvanic property generated in the batteries, was made to proceed along the wires, and in its passage to affect the mechanism in the case. In the construction of this mechanism, the great merit of the invention consists. It is a beautiful combination of brass wheels, and other details, the object of which is to produce a desired letter or figure at the exterior opening or dial. To bring any particular letter into view, the capstan is turned by the finger till the metal point projecting from a similar letter upon it, is made to touch a corresponding point near the side of the case. Thus, there is a sympathy, as I may call it, between the letters in the case and the letters on the capstan. A touch of the point opposite L, will bring L into view on the dial, and so on with any other letter. Nothing can be more perfect, or apparently simple. To appearance, the letters can be exposed at the rate of two in every moment of time. A lady, turning the capstan with her finger, brought into view the word London, in the time it could be uttered letter by letter, although the idea had to travel through four miles of wire.

In the transmission of the electric influence through the wires of this or any other apparatus, distance is of no consequence as respects time, for electricity is supposed, with some degree of probability, to travel with the velocity of light, or 192,000 miles in the space of a second. In point of fact, therefore, no longer time would be occupied in transmitting intelligence to the uttermost ends of the earth, than would be required for sending it across a room or a table. Distance is a matter for consideration only as regards expenditure of galvanic force. The electric agency has a tendency to weaken in its progress, according to circumstances, and this must necessarily be provided for by increasing the number of batteries to the desired amount and power. It has been supposed that the difficulty of perfectly isolating and preserving the wires from injury in their course, would be an insuperable bar to their establishment on an effective footing; but fears need be no longer entertained on this score. Each of the four wires in Professor Wheatstone's apparatus is wrapped round with a well-rosined thread, and the whole are then tied together with a cord possessing a similar coating, so as to present the appearance of a tightly-bound rope. This it is proposed to place in a small iron tube like that used for bringing gas into houses, and the tubes, united to any length, are laid below the ground, or in a wooden case on the surface, to preserve them from injury. Yet another difficulty here presents itself. What if the rope, or any particular wire, should be fractured somewhere in its course? How would the precise point of injury be discoverable? This the professor has likewise provided for, as far as it possibly can be. He proposes that there shall be a signal-case at an interval of every few miles along the whole line, and therefore should any injury be sustained by the wires, it will be speedily discovered in what portion it has taken place, and a new and complete section of rope inserted in connexion with the other pieces. To avoid a very remote chance of delay in the transmission of intelligence from this cause, it would be easy to lay two sets of wires, one of which could be employed while the other was in course of being repaired.

It was impossible to observe the beautifully rapid and exact process of communication effected by the apparatus before me, without entertaining the conviction that I saw the rudimentary working of an engine, which ere long must force itself on the attention of the world, and come into universal use. Whether in the form to which it has been brought by Mr Wheatstone, or in some other modification of the principle, it is indisputable that it possesses the power of an effectual, and at all times ready, mes-

Digitized by Google

senger of intelligence. Its capabilities have indeed been fully tested in a practical manner on the line of the Great Western Railway, to a distance, I believe, of fifteen miles; the apparatus employed being somewhat different from that which I have already described. Last September, when the wires of this electric telegraph were carried as far as West Drayton, the following account was given of it in one of the London papers:—

"The space occupied by the case containing the machinery (which simply stands upon a table, and can be removed at pleasure to any part of the room) is little more than that required for a gentleman's hat-box. The telegraph is worked by merely pressing small brass keys (similar to those of a keyed bugle), which, acting by means of galvanic power upon various hands placed upon a dial-plate at the other end of the telegraphic line, as far as now opened, point not only to each letter of the alphabet (as each key may be struck or pressed), but the numerals are indicated by the same means, as well as the various points, from a comma to a colon, with notes of admiration and interjection. There is likewise a cross (+) upon the dial, which indicates that where this key is struck, a mistake has been committed in some part of the sentence telegraphed, and that an erasure is intended. To a question—such, for instance, as the following: 'How many passengers started from Drayton by the ten o'clock train?'—the answer could be transmitted from the terminus to Drayton and back in less than two minutes. This was proved on Saturday. This mode of communication is only completed as far as West Drayton station, which is about 13½ miles from Paddington. There are wires (as may be imagined) communicating with each end, thus far completed, passing through a hollow iron tube, not more than an inch and a half in diameter, which is fixed about six inches above the ground parallel with the railway, and about two or three feet distant from it. It is the intention of the Great Western Railway Company to carry the tube along the line as fast as the completion of the rails takes place, and ultimately throughout the whole distance to Bristol. The machinery, and the mode of working it, are so exceedingly simple, that a child who could read would, after an hour or two's instruction, be enabled efficiently to transmit and receive information."

It being thus ascertained, by practical working, that the electric telegraph can perform all that its designers have proposed, it only remains that it should be spread in different directions over the country, or at the least laid in communication from London along the great lines of thoroughfare. The railways already formed and in course of construction, offer peculiarly eligible channels for the lines of wires. It is not to be expected, however, that any telegraph of this description is to be constructed at the public expense. It will require to be the private undertaking of a joint-stock company, and its services given at a price which would more than repay the outlay. The expense of tube, wires, and apparatus for a distance of four hundred miles, as from London to Edinburgh—provided a railway line were employed—would probably amount to L.25,000; and, once put in operation, the outlay is at an end, for the fresh supply of material for the batteries is almost too inconsiderable to be worthy of notice.

The method of working the apparatus will be readily understood. At each extremity of the line of rope—for it would work both ways—there would be an office for receiving and communicating intelligence, at a price conformable to the extent of the message. Being dispatched from one end, the communication would be instantaneously received at the other by an officiating clerk, and forthwith made known by a note to the party concerned. Thus, intelligence of the rise and fall of stocks, foreign news, orders for goods, or any other species of communication of an urgent nature, might, with the utmost facility, and at a trifling cost, be transmitted to any imaginable distance. To all merchants, capitalists, and, in particular, newspaper publishers, such a means of procuring intelligence would prove invaluable, and of course the benefit would be reflected on the public at large. The principle being placed beyond the reach of cavil, any attempt to put it in practice would depend exclusively on the question of expense and the necessity for its services. If it be reckoned of importance to possess speedy and correct intelligence on any given subject, here is the engine by which it can be attained. Do the people of Manchester, Liverpool, and other great seats of manufacture and commerce in the west and north of England, wish to possess the news of London as speedily as the people of London themselves, here is a means of indulging their wish ready to their hands. They have only to organise a very small establishment of officials, and expend a few thousands of pounds, and the matter is effectually accomplished.

Here I leave this extraordinary invention to the speculations of the reader. What may be its influence in aiding the progress of social improvement, uniting different nations in one common brotherhood, and extending the boundaries of knowledge, involves an inquiry too vast and intricate for solution in these pages.

THE CITY OF THE CALIPHS.*

The work to which is prefixed the title of the "City of the Caliphs," one captivating to the imagination from its association with youthful readings and recollections, is from the pen of the author of Travels in Arabia, published not long ago. The traveller, however, whose observations are chiefly recorded in the new volumes before us, was not Mr Wellsted, but his friend Lieutenant Ormsby of the Indian navy, who spent three years in various parts of the east. The former of these gentlemen had only the task of arranging and editing the materials given to him, verbally and otherwise, by his friend. The result is a work of much interest, from which we propose to select a few extracts, descriptive of the present condition of the old capital of Haroun Alraschid.

The city of Bagdat is situated on a low plain watered by the Tigris, at the distance of about four hundred miles from its influx into the Persian Gulf. The river divides the city into two portions, the larger being on the north-eastern bank. Founded in the eighth century, Bagdat became the capital of the Saracenic empire, and continued so for about five hundred years. It is now the metropolis of a pachalic or province of the Ottoman Porte, and the richest one, with the exception of Egypt, under its sway, being the most considerable place of trade in this portion of Asia, and the frontier of the Turkish empire against Persia. The pachalic includes the whole country from Busrah, or the Persian Gulf, on the south, to Mordeen on the north, and from Kurdistan and Persia on the east to Syria and Palestine on the west; but the Arabs, who constitute a large part of the population within these bounds, are nothing more than nominal subjects of the pacha of Bagdat. The city is walled and fortified, and is provided with lofty arched gates, some of them of great antiquity. Its appearance from a distance is thus described in the work before us:—"The sun rose, and Bagdat, although so many miles distant, was suspended as it were in mid-air before us; the rosy tints of morn illumined its gilded domes, its minarets, and other gorgeous signs of eastern dominion and magnificence. It was indeed a scene delightful to the eye." Mosques, caravanserais, colleges, baths, and the palace of the governors, form the chief public buildings in the city. The mosques, like the other houses, are of brick, and, in the year 1830, were numbered at a hundred; but none of them are very magnificent. A square building, surmounted by a dome, with a tank of water in a court in front, for ablutions after prayer, constitutes the usual style of the mosques. All of them are surmounted, however, by graceful spires or minarets, on the tops of which are placed small galleries, whence the muezzin sends forth the Moslem call to prayer. "Attached to each of the mosques, and supported by voluntary contributions, there is a school, in which boys are instructed, free of expense, in reading, writing, and in a knowledge of divinity and the Koran—the only education a Moslem cares to impart to his offspring." This last sentence recalls to one's mind the principle upon which the immediate successors of Mahomet destroyed the splendid ancient library of Alexandria. "If it contained any thing in opposition to the Koran," said they, "it deserved to be burned; if its contents were all in concurrence with the Koran, they were a superfluity, and not worth preserving." By this fanatical decision, we need scarcely remark, the world sustained an incalculable and irremediable loss.

Neither the governor's palace, nor the caravanserais, are worthy of notice as specimens of architecture. "The bazaars," says our author, "form to me the most interesting feature in an eastern city. Narrow streets are either arched over with brick, or a roof of grass, dried leaves, and battered canvass is supported by transverse beams extending from roof to roof." The heats of day keep the people within doors, but "at night the blaze of a hundred lights, either of lamps or torches, exchanged all into life and gaiety. The shops on either side are small rooms, about eight feet square, the front of which is open, and the owner seats himself, usually with a fan in his hand, on the floor, which is raised about three feet above the level of the street. Unless the arrangement is of great importance, or very lengthened, it is concluded without the purchaser leaving the street; but should it prove otherwise, he seats himself alongside the merchant, pipes and coffee are called for, and the weighty matter discussed in all its bearings. Perhaps the tradesmen at Bagdat are surpassed in address by none in the east, excepting possibly their neighbours the Persians; no one at a glance can better detect the 'weak points' of a customer." The different trades have separate bazaars. The most opulent in Bagdat is that of the clothier, where are to be found the costliest dresses of Surat muslin, shawls from Cashmere, sabres from Damascus, and carpets from Persia, all of magnificent appearance. Otto of roses, also, forms one of the most common articles of trade, being sold in the perfume bazaar, and often at five guineas an ounce.

As a whole, the city of Bagdat has an unpleasant appearance to the visiter residing in it, the streets being narrow, dirty, dark, and damp. But the uninviting aspect of the houses must not lead travellers to imagine that the inhabitants are poor or distressed. "It is with a despotic government a part of their system to avoid outward show. Within, the houses are not unfrequently furnished with much costliness. The walls are inlaid with mirrors, and fancifully decorated with mother-of-pearl." Carved wood-work, rich cushions of crimson velvet, beautiful carpets, and furs, are common additions to these internal ornaments. The inhabitants of Bagdat are all ostensibly industrious, either as tradesmen, merchants, or government officials. Such a thing as an idle "gentleman" is unknown. Yet the people are indolent enough in disposition. The most trifling amusements please them; coffee, pipes, drafts, chess, and the sight of professional dancing, are their favourite recreations in private. Though abstemious in company, in their solitary moments they indulge in wine, and they are also fond of opium, and of the seed of a species of hemp which has an inebriating effect. Robes of purple or scarlet silk, turbans of fine white muslin, and loose drawers, with socks of bright yellow leather, form the dress of the higher orders; while the poor wear merely a sort of shirt, confined by a girdle. This light dress is no disadvantage at times, for the desert winds frequently raise the thermometer to 124 degrees, and the people think it absolute bliss to get into underground chambers, where the thermometer is *only* at 90 degrees!

This description applies in a great measure to the Bagdat of 1840, as well as to the city in 1830, the year of Lieutenant Ormsby's first visit. But in other respects the city is greatly, lamentably changed. In 1830, Bagdat contained about 120,000 inhabitants.* Of these, two-thirds were composed of a mixed and fixed race of Persians, Turks, and Arabs. About 7000 of the remainder were Jews, and the rest Christians, chiefly of the Armenian persuasion. Toleration so far existed, and yet exists here, that both Jews and Christians frequently rise to seats in the divan, and to the highest offices of the state. The divan is a deliberative council, composed of selected inhabitants, who meet every Friday to consult on affairs of moment. The Pacha, however, who has been for centuries a member of the important body of the Mamelukes, has the real power in his hands. The trade of Bagdat consists chiefly in importations of sugar, muslin, coarse and fine cloths, and other articles from India, &c., which are brought up the Tigris in track-boats, and are extensively sold to the more inland people. The principal articles in return from Busrah (once called Balsora) are galls, copper, raw silks, and salt from the desert.

Having now given our readers, with the help of the work before us, a part-view of the modern state of things in the city of the Caliphs, we turn to a point which will probably prove more interesting to the reader, and which will explain the observation made respecting the lamentable change which has befallen Bagdat, and made it in some respects very different from what it was ten years ago. When Lieutenant Ormsby was at Bagdat, in April 1831, the plague visited the city. Before it arrived, the people were in a state of strange apathy. They heard of the terrible disease stalking from village to village in the vicinity, in the direction of their abode, yet they seemed eager to stifle the horrid conviction of danger. "But this could not last long; a feeling of alarm suddenly arose, and appeared as unaccountable and extraordinary as their former apathetic indifference. They now stared as awakening from a fearful dream. They must fly:—but whither! To the desert! The Bedouin was lurking at every avenue, to rob and spoil those who, with their valuables, attempted to quit the city. By the river! Every boat was crowded, and the disease followed them in their flight." The British residents and Armenian Christians shut themselves up in their houses, barred the doors and windows, and hoisted up by ropes any necessaries which had from time to time to be added to their stores. The majority of the Moslem population, with the apathy of fatalism, resigned themselves indolently to their fate. Very soon the ravages made by the plague in the city were dreadful in extent. "All distinctions of society, friends, or relations, had ceased; the finger of God seemed pointed to this devoted place. A thousand died a-day; the seats of justice were unoccupied; the wailing for the dead, which at first had incessantly filled the air, was now hushed to a silence and a calm more frightful; the dead lay unburied in every avenue. Then arose a number of ruffians, who, with a courage growing out of their fearful position, formed themselves into bands, under leaders more demoniac than them-

* Travels to the City of the Caliphs, &c. By J. R. Wellsted, Esq. London: Henry Colburn. 1840. Two vols.

* In one place, the work before us states the population of 1830 at 130,000, and in another at 150,000. We believe the first computation to approach nearest to the truth.

selves, and swept the streets. On one occasion I passed a group, who had collected in a low apartment, and were whetting and lashing themselves into a state which should fit them for further outrages; a wretched hag, her form almost bent double, was supplying them with a fiery spirit, and lumps of half-grilled meat; a few of their number, overpowered by the former, were lying senseless on the floor; others, cursing and howling like half-famished wolves, were, with utter disregard to the safety of their companions, brandishing about their daggers and sabres, or firing their matchlocks against the roof of the apartment. But amidst the clamour, the din, and the confusion of this pandemonium, the greater number sat silent at the board, their eyes gleaming with a maniac's wildness and ferocity, quaffing the spirits in almost incredible quantities, yet waiting their effect in producing a fit state of excitement for them again to sally forth." An Aga related the following instance of these men's conduct. The Aga was ill, and tended by his beautiful and beloved wife, when the ruffians burst into his chamber. "I read their purpose," said he, "in their looks; but I was stricken, and could not lift a finger to save her for whose life I would gladly have forfeited my own. A savage ruffian approached her; entreaties for life were unavailing; yet for an instant her extreme beauty arrested his arm—but it was only for an instant; his dagger again gleamed on high, and she sank a bleeding victim beside me. Cold, and apparently inanimate as I was, I felt her warm blood flowing past me, as with her life it ebbed rapidly away. My eyes must have been fixed with the vacant look of death: I even felt unmoved—as he bent down beside me, and with spider-like fingers stripped the jewels from my hand—the touch of that villain who had deprived me of all that which in life I valued. The figures of his companions, as they came to rifle the apartment, appeared to dilate before me, and their eyes to glare upon me, as they pointed, with fiend-like gestures and horrid laughter, to the bleeding innocent beside me. At length, a happy insensibility stole over me." The Aga was afterwards nursed and restored by the exertions of a faithful slave.

The effects of despair upon wrecked or endangered mariners have been frequently noticed. The case was much the same at this time in Bagdat. "Some took to drinking; others to praying; many, to make the most of their time, launched into every excess." Yet amid this general extinction of moral feeling, the best features of man's character were here and there displayed in force. An Italian, hearing that a friend was seized with the plague, and lying at the gate of the city, went for him, carried him home on his back, and tended him till he was well. Other similar traits of conduct occurred—noble ones, if we consider all the circumstances.

The city was in this dreadful condition, when a new calamity befell it, and one, too, of the most awful nature. "On the night of the 29th of April, the river, which had rapidly filled its bed (through rains), in one dreadful rush burst its banks, and overwhelmed the greater part of the city. *Fifteen thousand* people were summarily hurried to eternity! There were many who had survived those best beloved, and awaited their fate in silence, making scarcely an effort to escape. It was not till after the first burst of water had subsided, that the greater number of the houses fell, the foundations not being loosened till several hours afterwards. I was sleeping at the top of the house when the flood burst in upon us, and was awakened by the roar of the waters rushing past the hall. I remained perfectly quiet, convinced that no human exertions could avail me. No outcry accompanied the convulsions; I heard no shriek nor wail; but as I seated myself on the upper part of the wall, I could perceive several bodies, their white dresses gleaming amidst the turbid waters, silently sweeping by. Towards the morning, the flood became less rapid and deep; and at sunrise, finding that it was not a greater stream than I could wade through, I let myself down by a rope into the street. Hardly had my feet touched the ground, when, with a mighty crash, down came the house!"

This narrow escape made an impression on the mind of the writer greater than even the plague had done. He resolved to quit Bagdat, and soon after accomplished his purpose. In the following year he revisited it, and found the plague not yet extinct. In addition to this calamity, the pools of water left by the flood grew stagnant, and gave rise to a destructive fever. But this was not all. The army of the sultan, with whom the regnant pacha was at variance, invested the city as soon as the plague ceased, took it, and gave it up to plunder. In the course of two years, by these events, the population decreased to 20,000, five times that number having either perished or left the city, two-thirds of which were now in ruins. Our author found it an awful spectacle. "I strolled forth amidst the now desolate city to seek such of my friends as pestilence and the flood had spared. Alas! how small the number to receive my greeting!—whole streets were depopulated by the one calamity, and overthrown by the other." Since the date referred to, Bagdat has partly recovered its population and commerce; but a century will not entirely remove all traces of the mishaps which it suffered.

Though occupying a prominent place in the title-page of the volumes before us, the city of the caliphs forms the subject of but a small part of their contents. The shores of the Persian Gulf and Mediterranean, Arabia, and the isle of Socotra, were traversed and examined partly by Mr Wellsted, and partly by Lieutenant Ormsby, and we have much interesting matter regarding them here. The reader will find his attention and trouble amply rewarded, should he take up these volumes for perusal.

STORY OF URBAIN GRANDIER.*

THE recent papers upon witchcraft and superstitions in general, which have appeared in these pages, have presented some strong and melancholy cases of human delusion and consequent human suffering; but no single one of these cases can compare in interest with that now about to be laid before the reader, and which relates to a similar subject. Urbain Grandier was born at Rovère, near the town of Sablé, in the first years of the seventeenth century. He was the son of a respectable notary-royal, and, being intended for a clerical life, was sent to prosecute his studies at Bourdeaux. While there, he distinguished himself highly, and the fraternity of the Jesuits, under whom he studied, were so well pleased with his progress and capacity that they appointed him, while still very young, to the living of St Pierre, at Loudun in Poitou, which was in their gift. He was appointed, soon afterwards, a prebend in the Church of St Croix, in the town of Loudun. This double appointment, conferred on a youth and a stranger, excited much envy; and this circumstance, conjoined with others, led to deplorable consequences.

Urbain Grandier was a man of remarkable beauty, both as regarded countenance and figure. An air of distinction sat upon his whole person and appearance. In conversation, he united great facility of speech with elegance of language, and preached with much force and impressiveness, his orations being characterised, it is said, by no ordinary degree of eloquence and genius. His success and estimation among the people of Loudun added to the hatred which many of his clerical brethren had conceived towards him, and, unfortunately, Grandier was not of a conciliatory disposition, nor exempt from such errors of conduct as gave his enemies an advantage over him. He was haughty in manners, and gave his tongue free scope in exposing from the pulpit even the religious abuses around him. He was attached to female society, and, although so many of the charges brought against him were proved to be false that we may reasonably doubt the whole, he was incautious, at least, in his department in this respect, and gave too ready a handle to calumny. He had certainly one intimate female friend, a young and beautiful woman named Madeleine de Brou, to whom he seems to have paid addresses, as a manuscript treatise against the celibacy of the clergy was found in his repositories, written apparently to satisfy doubts of hers. There is no good ground, however, for assuming that their connexion was actually an improper one.

Such was the man—young, high-spirited, captivating in appearance and address, talented, and accomplished—against whom charges of the most extraordinary nature were brought in the year 1633. Previous to that time, several minor charges had been preferred against Grandier by his enemies, out of which, as well by his innocence as by his decision and boldness, he had come triumphant. The party chiefly offended by this result was a priest named Mignon, canon of St Croix, and director or chaplain of an Ursuline convent at Loudun. Under the auspices of this man, the new scheme against Grandier was originated and developed. Slowly and gradually a rumour spread through Loudun that something extraordinary was going on in the convent of the Ursulines. Stories of phantoms and visions were the first things heard, and by and bye it was whispered that some of the nuns had exhibited symptoms of magical influence or demoniacal possession. At length, confirmation was given to these reports, by the open announcement that Mignon, the chaplain, was about to exorcise the demons that possessed several of the nuns. Mignon called in to his aid the curate of a neighbouring parish, and the people of Loudun beheld this ecclesiastic enter the town in procession, at the head of his whole parishioners, to assist in performing the great feat at the convent. There, also, assembled the chief magistrate of Loudun and other functionaries. Mignon received them, and informed them that the superior of the convent herself, Jeanne de Belfiel, a woman of great beauty and high rank, and a lay-sister, named Claire Magnoux, were the parties possessed, and who were to be exorcised. He also told them that the name of the superior's demon was Ashtaroth, and sister Claire's, Zabulon. When the visiters were introduced to the possessed pair, the latter seemed to be in convulsions, and made the most extraordinary grimaces. Mignon commenced to interrogate the evil spirit of the superior. He did so in *Latin*, in order to convince the spectators that it was a demon who spoke by the lips of the nun, she herself being ignorant of Latin. "*Quis misit?*" (Who sent you here?) said Mignon. "*Urbanus Grandier*" (Urbain Grandier) was the reply. "*Dic qualitatem*" (Tell his quality), said Mignon. "*Sacerdos*" (a priest) was the answer. Two or three other questions were asked of a similar kind, and fixing the guilt of magical arts upon Grandier. One of the spectators wished to ask another Latin question, but the demon would answer to nobody but Mignon, and, to avoid the dilemma of any farther interrogation, the superior, after replying to the chaplain's list of questions, chose to give up her convulsions, and assume a quiet demeanour. It was remarkable that the imp possessing the lay-sister was not a Latin scholar, and, on being asked any questions, referred the interrogator to his friend who possessed the superior.

These exorcisms were repeated at various times before other spectators. It was then discovered that the demon of the superior, who took the lead always, was, after all, a very bad Latin scholar, and confounded moods and tenses in a very remarkable way. He put *Jesus Christus* for *Jesum Christum*, and *Jesu Christe* for *Jesus Christus*, with various other mistakes of the same kind. Moreover, the demon's general command over the languages seemed very limited. When any sceptical persons present desired a Latin version of any word or phrase apart from the interrogatories of Mignon, the demon was dumb, and it was also found that he knew no Greek. One day, while the exorcisms were going on, a cat ran across the apartment. "A magician! an evil spirit!" was immediately the cry, and the animal was seized. Mignon exorcised it with great gravity, and tried it with Latin; but, strange to say, the cat said not a word in reply.

These things went on for some time, until Grandier, becoming alarmed at the consequent reports sent abroad relative to himself, applied to the archbishop of Bourdeaux for an inquiry into the affair. The prelate appointed two persons to conduct the inquiry, giving them instructions to test the learning of the demons, as well as their other powers. But the demons did not wait for such an examination. They fled whenever they heard that such a thing was to take place, and Mignon, with all his assistants in conducting the previous farces, became suddenly quiet, and said no more about the matter.

Urbain Grandier would now probably have escaped all farther danger, had not M. Laubardemont, a creature of Cardinal Richelieu, arrived in Loudun to demolish the castle, in accordance with a law passed on the subject. It happened that a satire had been written on the cardinal some time previously, and Grandier's enemies, while they renewed the spectacle of the possessions in private before Laubardemont, took care also to impress him with the idea that Grandier was the author of the satire on the cardinal-minister. The consequence was, that, on Laubardemont going to Paris with this report, the irritated and revengeful Richelieu instantly sent him back with a commission to inquire into the guilt of Grandier, as regarded the charge of enchantment. Under the fostering care of the commissioner, the possessions at the Ursuline convent revived with increased vigour. In all, five nuns, and at least ten laical females, were found to be afflicted with the spirit of grimaces and convulsions. The superior still played the principal speaking part, and, from her admissions, it was made out that not less than seven distinct demons had taken up a lodgement in her single person. The men who managed this whole affair, having now the desire to maintain their own credit added to their hatred of Grandier, resorted to the most villanous tricks to confirm the idea of the possessions. For example, they made the devils of the superior promise to work miracles. On one occasion, the superior was to stand in the air at a height of two feet from the ground. She did take up something like this attitude, by some contrivance or another; but a curious spectator, turning aside her long robe, found her standing very firmly on the ground on *one foot*. On another occasion, the demon promised to lift the hat of M. Laubardemont in church, and hold it suspended for a time in the air. A second curious spectator examined too closely into this matter, for he found a thread and a hook hanging above Laubardemont's head, ready to perform the trick in a very natural way. In truth, Mignon, and his chief assistant Father Lactance, went so far as to make frequent arrangements with the demons, entered into compacts with them, and carried on a correspondence of the most intimate kind.

Meanwhile, the excitement caused at Loudun was tremendous. The people daily assembled in crowds at the churches and elsewhere to witness the convulsions and grimaces, which formed the easiest and most common of the demoniacal displays.

* We take the details of this story from the Causes Celebres, but think it proper at the same time to follow other historians on some points, a strong prejudice being shown in that work against the unfortunate hero of the transactions recorded.

Digitized by Google

To the general mass, all this was matter partly of amusement and partly of terror. To Grandier, who was thrown into confinement by Laubardemont, the affair was one of life and death. His persecutors actually brought him out before the public, with strange inconsistency, to exorcise personally the demoniacs, in the name of God. His conduct on this occasion extorted admiration from all. His comparative youth, his remarkable beauty, his calm dignity, and the air of conscious innocence which never left him, made him indeed like an angel (to use the words of the Causes Celebres) in the midst of real demons. One ecclesiastic alone dared openly to take his part at these scenes. This was the Abbé Quillet, who, hearing one of the demons threaten to hang up any person who ventured to doubt the possessions, defied the pretended spirit to his teeth, and dared him to do his worst. The *demon* did nothing to the bold abbé in consequence, but M. Laubardemont gave him a hint which rendered it prudent in him to try the air of Italy for his health immediately afterwards.

The strongest evidence of the fraudulent nature of all these pretended possessions was given by the recantation of Sister Claire, and two others of the performers in this strange farce. The poor girls confessed that they had accused an innocent man, being instructed to do so by Mignon, Father Lactance, and others. They represented themselves as compelled by remorse to declare the truth. This recantation did no good to Grandier, being styled a device of the enemy. Even when Jean de Belfiel, the main agent in the whole deception, followed the example of the other three, it was ascribed to the same cause. The miserable superior, who, it is thought, had been led by Mignon to believe that her convent would acquire lasting renown by this affair, was so vividly struck with remorse, that, after confessing her imposture to M. Laubardemont, she endeavoured to hang herself on a tree, but was prevented. These confessions did not benefit the victim, we repeat: M. Laubardemont, who had Grandier's fate in his hands, was determined upon his death. Accordingly, the accused person was tried by a commission *nominated* by Laubardemont, and was condemned, on the 18th of August 1634, to undergo the torture in the first place, for the discovery of his accomplices, and then to be *burned alive!*

M. Laubardemont engaged, or rather compelled, an eminent surgeon named Fourneau, to be present at the torture. But on the order being given to pull out the eyebrows and wrench off the nails of the victim, merely as a preliminary process, Fourneau protested that he "would not be the agent in exercising such cruelty at the bidding of any living man;" and further said to Grandier, that it was with regret that he laid hands upon him at all. Grandier, who had expressed himself resigned to all, said to the surgeon, "You alone have pity on me." "No," replied Fourneau, "it is you who do not know the thoughts of others." The torture, which consisted in forcing wedge after wedge between the legs and a wooden case, was applied with almost unparalleled cruelty. The marrow ultimately spouted from the crushed bones. Yet the victim preserved an unvarying firmness, though he several times fainted away. He confessed nothing. He said he had been an erring man, but ever a believer in his Saviour and in his God, and guiltless of all laid to his charge.

When conveyed to the stake, Grandier had been promised two things. The first was, that he should be allowed to speak a word to the people; the second, that, in mercy to him, they would strangle him with the cord which he carried about his neck on the way to execution, as soon as the fire was kindled. On the passage to the fatal pile, the priests walked in procession, exorcising by the way the air, the wood, and every thing around. When they asked him if he would confess, he said he had confessed all already; and when they asked if they would pray for him, he answered mildly and sweetly, "Yes, yes, pray for me, I entreat you." But it was no part of the plan of the priests to allow him to move the multitude by his dying eloquence. When he reached the stake, and was about to speak, they threw holy water upon his face in such quantities as suppressed his words, and, with the same view, one of them embraced and kissed him. Grandier saw their purpose, and merely said, with a gentle smile, "The kiss of Judas!" The words were heard, and one of the priests, under pretence of making him kiss it, struck him several times on the mouth with a heavy iron crucifix. Breaking promise respecting the strangling, Father Lactance, the most inveterate of his enemies, lighted the pile with his own hands, saying, "Wilt thou renounce the devil, wretch? Thou hast not an instant to live!" "Is this charity, Father Lactance?" said Grandier, calmly. "There is a God who will judge between me and thee. *Before him I summon thee to appear in one month!*" After this remarkable speech, he only uttered the words, "God have mercy, have mercy upon me!" More merciful than the priests, the multitude thundered out an unanimous demand that the victim should be strangled, and the affrighted executioner would have done so, but the flames had by this risen into force, and he was unable to effect his purpose. Thus the unhappy Grandier was burned alive.

We have been unable to give more than an outline of this famous case, which has a deep interest as one of the last instances in which the imputation of magic brought a human being to the stake. The gross injustice exemplified therein had a beneficial effect ultimately, in causing a disbelief in all similar charges; and thus it is, that, in the arrangement of human affairs, even the sufferings and errors of mortality are turned to good by the wise Disposer of all things.

BOUTS RIMÉS.

THERE are some things in this world which severely sensible people are apt to think very silly, but which are nevertheless useful things enough, seeing that they enable many people to pass, in a very agreeable way, and quite harmlessly to others, time which would otherwise hang heavily on their hands. Bouts Rimés take their place amongst those things. They are of French origin and invention, as befits their light and playful character. A Parisian poet of the seventeenth century, named Dulot, one day made the strange complaint in company, that he had had three hundred sonnets stolen from him. The amount of this lot of poetical property astonished every body. "Oh," said he, "they were only blank sonnets, or rhymes (*bouts rimés*) of all the sonnets I may have occasion to write." He had, it appeared, employed himself in drawing up columns of rhyming words in the form of sonnets, with the design of filling in the lines and the ideas when he could get leisure, or when the Muse might so far favour him. The idea was too whimsical not to produce an impression, and we are told that, in consequence of Dulot's statement, all the wits in Paris immediately set about making up sonnets, on the principle of fixing the rhymes first. A quarto volume of *bouts rimés* was published in 1648, the first work of the kind we are aware of, but not the last. The art, or sport, as it may be called, afterwards found its way to other countries, and to our own amongst the rest. Horace Walpole was not guiltless of the frivolity, for, on having prescribed to him the rhymes,

brook,
why,
crook,
I,

he instantly produced the following verse, to which he gave the title of

THE GENTLE SHEPHERD.

I sits with my toes in a brook,
And, if any one asks me for why,
I hits 'em a rap with my crook,
And "'tis sentiment kills me," says I.

It is of course obvious that a party of friendly people, spending a winter evening together, may, amongst other amusements, resort to that of scribbling *bouts rimés*. All may not be alike quick or ingenious in filling up the prescribed rhymes; but the wits of all will be exercised, and, while some of the resulting verses will surprise and amuse by their felicity, others will perhaps occasion a still heartier burst of laughter by their very lameness and emptiness. Those nearest a match will be eager to excel each other in bringing the verse quickly out, as well as in bringing out a good verse; and those who despair of making up verses of their own, may take an interest in the proceedings of the readier wits, and find a disinterested pleasure in *backing* one clever fellow, or one smart young lady, against another. Much jocularity must evidently attend such an intellectual competition as this, and perhaps some little sharpening of mind may also be the consequence. At the least, the party will find that they have spent two or three hours innocently and happily, and do not like each other the worse for the drollery they have been indulging in together.

It is well, in such a case, if clever verses are produced; but this is not absolutely essential. In such private exercises of the poetical talent, people do not look for the expression, correctness, and effect, which they expect in compositions submitted to them in print. They will find themselves ready to say, "pretty fair," "very well," "ha, ha, ha, excessively good indeed," to things which, if put coolly and typographically before them, they would be inclined to toss aside as not worthy of a moment's regard. To convince our readers of this, we shall adduce a short series of verses which were lately produced in the course of one evening by a merry little party, who had fallen upon the game by chance, as a means of whiling away the time between tea and bread and cheese, and most of whom had never before heard of *bouts rimés*. The merit of the verses will, we expect, be considered as moderate; but that is exactly what is required to convince them of the merit of the game as a means of giving amusement, for we can assure our readers that the production of these verses kept the party laughing for the most part of an evening.

The rhymes given out on this occasion were all of them alternate rhymes for a verse of four lines. The first set was composed of the words, *grant, ask, shan't, task*; and of the verses consequently produced, the following were the best:—

If from good nature you begin to grant
Whatever favours folks may choose to ask,
'Twill grow more difficult to say "I shan't,"
And courtesy you'll find a heavy task!

Sweet one, I pant for what you can grant—
What is it, dost thou ask?
'Tis a kiss that I want, so don't say "I shan't,"
When assent is an easier task.

The next rhymes given were *wave, lie, brave, die;* and of the verses written thereupon, we give three specimens:—

Dark are the secrets of the gulfing wave,
Where wrapp'd in death, so many heroes lie;
Yet glorious death's the guerdon of the brave,
And they who bravely live can bravely die!

Whenever I sail on the wave,
O'ercome with sea-sickness I lie;
I can *sing* of "the Sea," and look brave—
When I *feel* it, I feel like to die!

High o'er the ship came on the whelming wave—
One crash! and on her beam I saw her lie!
Shriek'd loud the craven, silent stood the brave,
But Hope from all had fled—'twas only left to die!

Prove, why, love, calamity, gave birth to the following stanzas:—

Of Baxter I cannot ap- prove,
And the reason is obvious why,
For the church he'd nor favour nor love,
So him I'd with Calamy-tie!

In life we mingled joys and sorrows prove,
Confused, and none can give a reason why;
Hate quickly treads upon the heels of love,
And morning bliss quells night's calamity.

Others produced were as follow:—

What is life?
What is death?
Continued strife—
The want of breath!

Last night we view'd a lovely star,
And all admired its joyous light;
Yet to my thoughts were clearer far
The lustrous eyes of Laura bright.

Next came the following apologetic strain from the fair Laura herself:—

I am not quick as thought,
Indeed I'm dull as night;
In fact I'm fit for nought,
But just to follow light!

One or two more, and we have done with the compositions of our evening party.

Few things appear more sad
Than to see an old man weep;
And few make the mind more glad
Than a crying child asleep!

The purity and joy of heavenly love
For earth's dull regions is too bright a thing,
Yet may the hope of future joys above
To denizens of earth some pleasure bring!

About thirty years ago, or rather less, it so happened that a set of poetical wits resided in or about the town of Anstruther in Fife, all of whom became very much knit up in the bends of good fellowship together, contrary to all precedent in their proverbially irritable and mutually repulsive fraternity. Finding much pleasure in versifying, and showing their verses to each other, they at length agreed to embody themselves into a society, and become subject to the regulations of solemn and periodic meeting. "The brethren were accordingly," to quote their own words in one of their publications, "constituted into an *union of rhymesters:* their code of laws was framed and sanctioned: diplomas, conveying a licence to rhyme and scribble in all shapes and manners, were worded in language fully as important and sounding as those of Universities for Doctors in Divinity. Long strings of rhymes were no sooner issued by the Presiding Bard, to be supplied with thought, than those dry bones and clattering skeletons of Poetry stood to our astonishment before us in all the fatness and bloom of completion. In short, the associated rhymesters swore eternal friendship and good humour over the altar of that heathenish god whose fire is their brain's inheritance, and uttering a joint ejaculation for his powerful assistance, they bowed the knee before their inspiring idol." The Muso-maniac Society, as it was fitly enough called, met and rhymed, and rhymed and met, if not to the production of much good poetry, at least to their own immense gratification, and it has been whispered that even learned persons from Edinburgh would occasionally appear in the Fifan burgh, having performed a journey by sea and land of thirty miles, for no other purpose than to participate in the gaieties of this merry corps. At length, unable any longer to keep so much drollery to themselves, they ventured to present to the world a thin volume, entitled "Bouts Rimés, or the Poetical Pastimes of a few Hobblers round the base of Parnassus,"* being dedicated "to the Lovers of Rhyme, Fun, and Good Fellowship throughout the British Empire." This volume has long ceased to be seen on the counters, or even the shelves, of all ordinary booksellers; but, by the favour of a friendly Muso-maniac, we lately became possessed of a copy, which will enable us to make the merry doings of the corps a little better known than heretofore.

We find, in this volume, no fewer than fifteen distinct and independent exercises on the rhymes, *sublime, time, day, bay, dawn, lawn, moon, noon, entire, fire, lake, shake, wing, bring, few, adieu;* and all of these, we have reason from their respective signatures to believe, were the production of different rhymers. It is extremely curious to observe the diverse character of the various sets of verses, some being solemn, some sentimental, and some comic, notwithstanding their all being bound to end with the same words. It is also curious to note how the various versifiers contrive to get over, by various expedients, the one awkward word in the set of rhymes, namely, the word *entire*—as also to see the same word made to tell impressively

* Edinburgh, printed for A. Mackay, High Street; W. Cockburn, Anstruther, &c. 1815.

in one production, and drolly in another. Out of the fifteen, we shall select four, as different from each other as possible :—

THE POET.

With eye of fire, and haughty brow sublime,
The poet fears thee not, destructive Time!
He toils unmindful of the passing day,
To gain at last the never-fading bay;
He courts the beauties of the golden dawn,
He dwells delighted on the dewy lawn,
But, chief at night, when the resplendent moon
Climbs the blue heaven to gain her silent noon,
Entranced he stands—wild fancy reigns entire,
And his high numbers burn with more than mortal fire!
Heedful he views the calm unruffled lake;
Careless he feels the earth with thunders shake:
He soars aloft on fancy's eagle wing,
From her high halls her airy forms to bring;
Or, snugly seated with a chosen few,
Bids the vain world and all its pomp adieu!

THE LAST DAY.

How dread, methinks, how awfully sublime,
When the last trump shall stop the march of time!
What shall avail, on that tremendous day,
The hero's laurel or the poet's bay!
Methinks I see the rosy-finger'd dawn
Shed her last ray o'er every hill and lawn.
Never to rise hath sunk the fulgent moon;
The sun may rise, but never reach his noon.
From earth, from heaven, with ripen'd force entire,
Bursts the wild sweep of all-devouring fire.
From heaven's high arch to the infernal lake,
Shall all creation to her centre shake.
Its fearful flight the trembling soul shall wing,
And to its God each vice and virtue bring.
Oh! may there then on earth be found but few
Not well prepared to bid the world adieu!

MORNING,

Written on Arthur's Seat.

On Arthur's lofty top sublime,
Seamed by the iron hand of time,
I sit, and view the coming day
Smiling from Portobello bay.
On Abercorn the ruddy dawn
Tinges each tower, and tree, and lawn;
On high the waning pale-faced moon
Is lost ere she attains her noon.
But see, with radiant orb entire,
Beaming, appears the god of fire!
O'er Duddingstone's enchanting lake,
While scarce a leaf the breeze doth shake,
The wild duck skirrs on rattling wing,
Condolence to its mate to bring.
Few are thy charms, Edina! oh, how few!
With scenes like these content, I'd bid thee long adieu!

JOHNNIE DOWIE'S.*

Though far from low, yet not sublime,
Here we pass our joyous time;
Excluded from the light of day,
Here sit the children of the bay.
What care we for the orient dawn?
What care we for the dewy lawn?
What care we for the pale-faced moon?
What care we for the sun at noon?
Here sparkling foams Bell's best *entire;*
There blazing burns John Dowie's fire:
What care we for the breezy lake?
What care we though the mountain shake
Fancy, be gone on eagle wing,
Come, Meg, another bottle bring.
Come, bring us bottles not a few;
A dozen yet we'll drink ere we bid John adieu

Upon another set of rhymes we have seven sets of exercises; but of these we shall select only one, being that which appears to us the most easily and happily concocted in the whole book :—

THE GOLDEN AGE.

Aid me, oh muse, to land in rhyme,
The golden and primeval time,
Old Saturn's happy day,
When Virtue over every clime,
Danced with young Pleasure in her prime,
And chased, with joyful shoutings, Crime
And Sorrow far away.

Then free and happy, sinless man
Exulting o'er earth's valleys ran;
Whilst in the starry frame,
His meditative eye began
The finger of his God to scan,
As, musing on the Almighty's plan,
He fed devotion's flame.

It seem'd as if his sacred train
Of thoughts, pure issue of the brain,
To Virtue's lyre did chime;
It seem'd as if, in lieu of rain,
The skies dropp'd honey on each plain,
Whilst grateful Earth sent up again
Hymns holy and sublime.

The Anstruther Muso-maniacs had their prepared and their extemporaneous effusions. The above are of the former character. The extemporaneous class consisted of shorter and more careless pieces, generally a single verse in alternate rhymes. A few of these are not bad, considering the manner of their production—such as :—

What is this life? a smoke, a bubble;
In this gay world, a foolish jig;
A joyless field of barren stubble,
And what is man?—a whirligig!

My heated brain begins to bubble,
With joy I dance the airy jig,
My hair lies flat (once stiff as stubble),
While round I fly—a whirligig!

The Brahmin of the East, who doth
Wash in the Ganges river,
Thinks he doth soul and body both
From future pains deliver.

Oh, wretched is the man that doth
Fall in a rocky river;
For why? he's drown'd and murder'd both—
No aid can him deliver.

Mark Tully was a clever chiel;
His fame is spread through all the nations;
He would have stunn'd the very deil,
And knock'd him down with his orations.

Will Pitt, he was a clever chiel,
He understood the laws of nations;
His eloquence would posed the deil;
Tully ne'er uttered sic orations.

In mathematic lore, dear George,
We own thou like a king dost reign;
But, haply, on Apollo's forge
Thou hammerest poetry with pain.

One would suppose a silly pen
A shabby weapon in a scuffle;
And yet the pen of critic men
A very hero's soul would ruffle.

And so here end the humours of the Muso-maniac Society of Anstruther.

* An old-fashioned tavern, situated in a dark alley in Edinburgh, and in which only one room had a window, all the rest being illuminated during the day by candles. It was once a favourite haunt of the poet Burns. For some years, a roadway has gone over the site of this ancient temple of conviviality.

CASES FROM HUTTON'S COURT OF REQUESTS.

WILLIAM HUTTON, author of the History of Birmingham, and whose autobiography affords one of the most pleasing instances of an individual rising by industry and proper moral conduct to a high sphere in life, in the latter part of his honourable career filled the office of judge in the Court of Requests in Birmingham, and left behind him a memoir of the more remarkable cases which came before him for decision in that capacity. This rather singular production having, in the course of half a century, fallen completely out of notice, has been selected for our series of cheap reprints,* from a conviction of its utility as a means of disciplining the popular mind both in notions of justice and in right reasoning and logic.

As a specimen of the amusing nature of the contents, we here offer the following cases :—

THE RAFFLERS.

The desire for gaming is predominant in every rank among us. There is an unaccountable pleasure in changing a certainty for a chance. If a man has a few old household goods that lie heavy upon his hands, the refuse of a broken mercer's shop, or a horse fit for the dogs, he publishes a raffle. The propensity to gaming, joined to his own little interest with his friends, will probably help off his tickets. The idea of having a horse for a shilling, whose very hide is worth eighteenpence, is a powerful motive to venture. The strong desire to win gives rise to unfair practices, and these to everlasting disputes. The disputants in higher life appeal to the sword; in lower to the Court of Requests; and, for want of that, to the fist.

Rossiter sued Wheeler for L.1, 18s. 11d. Wheeler replied, that Rossiter held a watch of his, value three pounds. It appeared that Rossiter owned a watch, which he put up to be raffled for, and had solicited Wheeler to take a ticket. They had agreed and fixed upon the number. That ticket happened to win the watch. Rossiter declared, that as Wheeler had neither paid for the ticket nor received it, he should have nothing to do with the prize, but as the ticket was in his possession, he would be the winner himself.

Court (to Rossiter).—As a bargain cannot be made without two persons, it cannot be broken without two. Wheeler has hitherto broken no part of his bargain, consequently you can break no part of yours. Had you agreed for ready money, he would have failed on his part, and the watch would have been yours. You fairly sold him the ticket, though the time of payment was not mentioned. The agreement was firm, though he had neither paid for the ticket nor possessed it; and had it been drawn a blank, he would have been responsible to you for the purchase-money, which you might have recovered in this court. We cannot make an order for your L.1, 18s. 11d., except you deliver the watch.

R.—Wheeler's credit is too bad to allow me to change a certainty for an uncertainty. Your orders cannot oblige a man to pay money who has none. The credit of a gambler is base currency.

C.—Has any artist valued the watch?

R.—Yes, and rated it at nine shillings.

W.—I will not take thirty for it.

C. (to Rossiter.)—Was it fair in you to puff forth your watch at three pounds, which, by your own confession, was valued at nine shillings? We shall make an order in your favour for one pound and eleven pence; you shall deduct eighteen shillings for the watch, and promise to keep it one year from this day, during which you shall return it to Wheeler if he ever tenders you the eighteen shillings. Both were satisfied.

THE RECKONING.

Marshall, a journeyman, was brought before the court, by the keeper of a public-house, for a debt of fifteen shillings; he acknowledged three shillings and ninepence, which he was willing to pay. It appeared that four people, of whom he was one, had spent an evening, and the above sum, at a public-house, had not paid their reckoning, and the landlord sued Marshall for the whole.

Marshall urged, "as he had not drunk the whole, he had no right to pay for the whole; he was but a fourth of the number, had drunk but a fourth of the drink, and ought to pay but a fourth of the money. No man had a right to pay for more than he received. The landlord ought to look to each man for his share, and not seek the whole from one; and that there could be no justice in obliging one man to pay for another."

Court (to Marshall).—When a company drink at a public-house, they can be considered by the landlord but as one person; they have joined themselves together, and he has no right to put them asunder. He cannot say to one, as he enters, "You may drink," and to another, "You shall not;" nor ask any one whether he has money to pay his reckoning. One may treat another, for what he knows, or he may treat the whole. It is a partnership for that night; and what right has the landlord to inquire who finds the capital? They are equally accountable to him for the whole debt. It is not enough that one pays his part, he must take care that the whole is paid; that is *his* concern, not the landlord's. When the partnership dissolves, whether it be at *mid-day* or *midnight*, every partner is responsible for the debts contracted in the partnership. He who sits silent in company has the same right to pay for the tankard as he who called for it; he who watches at the gate is just as culpable as he who robs the house. If one of them break a glass, it is nothing to the landlord who broke it; he can charge it to the company, as well as its contents, and they must settle the matter with the individual. If this were not the case, a landlord would soon have his cellar emptied, and nothing left to fill it. One man *with* money might bring a dozen without, who being strangers, the landlord is deprived of his property and his remedy; and as no evil can be brought upon a man without its attendant cure—for they follow each other like the substance and the shadow—we must charge the debt upon you. He can take any of the company, and he whom he takes may demand their shares from the rest. It is to your honour that he singles you out; he thinks you the Pam of the pack.

THE SHOEMAKER AND OLD SOLDIER.

Shad, a shoemaker, sued P, an old soldier, September 1, 1785, for L.1, 4s. P acknowledged that the debt might have been contracted, but pleaded the statute of limitations, which annihilates a debt after a lapse of six years, provided that debt is not kept alive by a continued account between the parties, or by an acknowledgment or a promise from the debtor. Shad declared he had had a running account, had recently sold him goods, and received payment. The court continued the cause, and desired him to produce his books the next court-day.

It appeared the debt sued for was contracted in 1778, after which P went into the army, and was absent five years. At his return, he frequently bought shoes of Shad, had not much credit, and had since paid.

The question to be considered by the commissioners was, whether the new connexion preserved the old debt? It was argued in favour of the delinquent, that the old demand stood by itself, stands the same still, and is cured by time; that whatever P bought, he paid for. That as P, out of gratitude, had become a customer again, it would be ungenerous to trap him for conferring those favours upon Shad which he might have conferred upon another.

It was urged in reply, that P laid himself open to a suit, by appearing in the verge of the court within six years; that his becoming a customer might excite Shad's patience, who might otherwise have made a more early attack; that the commissioners did not conceive they had any right to destroy a debt; that a new debt will piece to an old one, as well at the end of five years as five days; and as the two debts did not seem divided, either by time, law, or reason, they must be considered as one.

The bench having got over this stumbling-block, fell upon a greater. It was pleaded, in favour of P, that in the five years above mentioned he had been condemned in a court of justice for housebreaking; that his father, by his prudent behaviour, as sergeant in the militia, had obtained the good graces of Lord B., his colonel, by whose interest he had procured a pardon for the son, who had since settled, become a master, lived in credit, and stood a fair chance of acquiring a fortune. That the moment sentence of death is passed upon a man, he is dead in law; the judge can order instant execution. He can make no will, he can bequeath no effects, he can inherit no property, nor transact any business with the living. No action can lie against him; all his own debts are cut off, no creditor can claim upon him, consequently this demand ceases; and this is the practice of all our courts.

But it was remarked, if the law killed, the crown could make alive; that a pardon reinstated a man where the law found him. If the crown gives life, it gives all its appendages; every thing belonging to the man revives with him, consequently his debts. If he can claim, as P had done, why not pay? The crown is defective, if it cannot do what the law has undone. And to suppose life restored without action, is to suppose an impossibility.

These reasons operated with the bench; but still there was an obstacle they could not surmount—the practice of all the courts, which they were assured by professional men existed. The commissioners were set fast. They found themselves completely hemmed

Digitized by Google

in between law and equity, and, like Sterne's starling, "they could not get out." If they attempted one side, they would fly in the face of the law; if the other, they would break the mounds of equity: all the quirks of Westminster-Hall could not relieve them. That the debt was due to Shad did not admit a doubt, but how to give it him did.

As the whole legislative power is in the hands of the king, lords, and commons, and as every act of theirs is supposed the act of every man in the kingdom, it becomes requisite to pay a deference to the laws, though they may not exactly hit our sentiments. He pays his country an ill compliment who sets up his private judgment against theirs: besides, the precedent is dangerous; for if a man can trample upon one law, why not on another? which would immediately put a period to government. If a man will not submit to the laws, because those laws are defective, there is an end of submission, for no perfect system can exist, the weakness of our nature will not allow it. Again, if the commissioners acted against law, they acted against an authority equal to that under which they sat; for the same powers which favoured the culprit, constituted them a bench. Two evils offered, one of which they were obliged to commit; they therefore chose what they conceived to be the least, that of dismissing the cause. If they had acted against law, they could not have made reparation; but by giving it a simple dismission, they left Shad at liberty to pursue his antagonist in another court, or even in this, if any further light could be thrown on the subject.

The suitors were both hurt; one, because he could not recover his property; and the other, because the noisome snuff, which had been extinguished by a pardon, was publicly lighted up in court.

THE JEW AND THE CHRISTIAN.

A Christian summoned one of the children of Israel, and desired the court, with a significant smile, to take notice that his antagonist was a Jew. The court, in return, desired him to take notice that the declaration did not operate against the Jew, but against himself; that the bench were confined to the actions brought before them, and left the religion to the man.

The Christian was a jeweller. One of the parties had agreed that he should buy a watch of the Jew, value three guineas, and pay him in stone knee-buckles. When the Christian supposed that the Jew had sold the buckles, he sued him for L.1, 19s. 11d. as an overcharge for the watch, which he said had been valued at one guinea. No evidence appeared. The watch was produced, it seemed modern, but the bench were not judges of its value. On the other side, an evidence for the Jew declared he had seen the buckles; that the workmanship was exceedingly bad; that they fell to pieces without wearing; and that he could sell better at fifty per cent. under the price.

Court.—Perhaps the case before us is that of a Jew and a Christian, who, not having the fear of any religion before their eyes, strive which shall overreach the other. Truck is the most disreputable part of commerce; each side premises to charge the money price, but neither performs it. No man will barter away his goods if he can dispose of them for money; but defective articles rarely find a better market. He cheats, expecting to be cheated. Had the Jew or the Christian received the other's property, and refused to deliver his own, we should have enforced payment. But as each saw, received, and approved the purchase, each fulfilled his bargain, consequently nothing can lie against one more than the other; we shall dismiss the cause, and leave the parties to cultivate their talents for cosening.

THE COAT AND MANY OWNERS.

Pemberton was a stranger, of a moderate capacity, about fifty; had married a girl of twenty, who appeared handsome, modest, and agreeable, but not much wiser than her husband. She had never seen the world, and he was never able to see it. This loving couple, with one child, in 1786, came to seek their fortunes in Birmingham, and took up their abode in Moor Street, in a den of thieves. The husband was easily enticed to get drunk, and treat the whole crew, which expense, with three shillings borrowed by Hill, broke him. Hill then persuaded him out of his coat, which he gave to A, and he pawned it to B. C fetched it out of pawn, and sold it to D for two shillings and twopence. D having mended it, sold it to E for four shillings; and perhaps this hackneyed coat, in a fortnight more, would have travelled through the whole alphabet. Pemberton sued Hill for thirteen shillings and sixpence—half a guinea for the coat, and three shillings borrowed.

Money is the grand standard to which all property is brought to find its value; this is the only certainty we know; and except property of every kind has been tried by this standard, it cannot be pronounced a debt, nor recovered in this court. If Pemberton has a right to charge his coat at half a guinea, why not at half a score? If the bounds of value are not exactly prescribed, those bounds, like space, become infinite. Had Pemberton been defrauded of his coat while new, it would have borne a certain price, but becoming second-hand, that certainty ceases; the bench cannot treat it as a debt.

All the parties appeared; some of them, I knew, had practised the arts of deception for thirty years. They spoke loudly in favour of themselves, as people usually do whose actions will not speak for them. They alleged against Pemberton that he was a foreigner and a papist.

Court.—As he who wilfully sets the house in a flame is the first to cry out fire, so he who *injures* is the first to censure the injured. Pemberton being a stranger, should have taught you another conduct. A stranger is entitled to our civility and protection, but you consider him an object of plunder. You also accuse him of being a Roman Catholic: this proves nothing against *his* religion, but much against your own, for it proves that a Protestant is both able and willing to rob a Papist.

We direct that E shall relinquish his four-shilling bargain to D, and that D shall return the coat to Pemberton, paying him three shillings—two shillings and twopence for the purchase, and tenpence for mending, which being paid on Hill's account, brings the coat to the standard of value, and adds three shillings to his debt; we shall therefore make an order against him for six, and recommend a lesson he will never learn—to show kindness to strangers, and justice to all.

A SUBALTERN'S REMINISCENCES OF A TRANSPORT.

To the best of my recollection, Beresford, in his "Miseries of Human Life," never makes the slightest allusion to a transport. This is passing strange: it would have yielded him a fruitful topic. If to be amongst three or four hundred people, soldiers and sailors, and wives and children of the former, whom the fates have ordained to be stowed away in a little ship for a long voyage, be not one of the miseries of human life, I know not what is. The best illustration I can give of a transport is a hen-coop well crammed with fowl; and, generally, the conduct and behaviour of her crew, or rather her passengers, are much the same as those of the fowl in a hen-coop—by no means the most gentle, peaceable, or forbearing. So as they can in any way accommodate themselves, no matter how much they discommode their neighbours. Certainly the well-filled transport at sea is the place in which to see human nature divested of those many little disguises, which in general make it pass off so plausibly.

Here comes a draft of the —th from Chatham—a vile place, in my opinion almost as bad as a transport. A hot march it is to Gravesend: what an appropriate name this place has!—the last ground, perhaps, your foot touches until you tread on a foreign soil, which is likely to be your final resting-place! There rides, on the bosom of Father Thames, the vile vessel, No. —, that in a few short hours is to transport those fine young fellows from their native shore. The boats are at the pier—they embark—they ascend the ship's side—the anchors are weighed—the sails unfurled—and the loud and hearty cheer proclaims she is urging her winged flight! A cheer under such circumstances, strikes more mournfully on the ear of a reflecting man than the tolling of a funeral bell. How many of these voices will be stilled ere the passage is over! How many a manly corse, with sullen plunge, will cleave the parting waters! Many that will survive the voyage, will sleep beneath the shadow of the feathery palm! How few, alas! how few, will return to the scenes of their youth, and raise the loud cheer, as the shores of their native land break dimly on their view, over the breast of the waters!

But few such thoughts, I ween, trouble the thoughtless throng. They are depôt men, all heart and spirits, going to join their service companies. What do they know of care, or disease, or the sigh of the exile, on a foreign shore, for the land of the dreams of his boyhood!

The transport is destined, in the first place, for Cork, to take in detachments for other corps, and to lay in the sea stock. We will not dwell long on the squally weather that is frequently met with in the channel—we will pass over tacking, and reefing, and lying to—and, without any more preamble, bring the ship to anchor off Spike Island, near the Cove of Cork.

All bustle again, embarking divers detachments. Facings of black and blue, buff and white, mingled together—stowing of knapsacks, haversacks, hold-alls, well supplied with pipeclay, soap, and tobacco—slinging of hammocks—Scotch, English, and Irish, knocking up against each other—officers making choice of cabins, or berths, as the case may be—second lieutenants disputing with ensigns about priority of rank. This reminds me of a ludicrous affair of two ensigns going out in the same ship, when the senior said to the junior, "If you do your duty, you will find me a very easy commanding officer." But here permit me, for the information of the uninitiated in the arcana of military life, to state that the seniority of date in commission is a matter of no trivial importance aboard a transport, as the junior seldom fails of getting the worst berth.

Now comes a very useful part of the community—a set of bristly, noisy Irish pigs, kicking up a dreadful row, and looking as if they by no means relished the idea of expatriation. How that big hog roars! Heu, heu! the world we live in—the ungrateful world! Poor brute, perhaps you have helped to pay the *rint*, or the tithe, and the reward of all thy merits is to be cut up to appease the appetite of strangers. How he struggles, and kicks, and roars! There is certainly nothing lamb-like about him. Another haul—he swings bravely over the gangway—lower away now—that will do—he is safe in the long boat! quite enough to terrify the few timid sheep, that are huddled together in the farther end of it, with his hideous screaming and grunting; but still there is an honest indignation in the whole of his conduct. If the brute could speak, he might exclaim with Scipio (and with the greatest possible assurance that his prediction would be fulfilled), "Ingrata patriæ, non possidibis mea ossa."* What comes next? Gobbling turkeys; some of them regular patriarchs, and no mistake. No joke to pick one of these drumsticks! And geese and cackling ducks, firkins of Irish butter, and potatoes raised by the "finest pisantry" on earth.

The pilot is aboard, looking "mighty 'cute" as paddy would say. Stand round the capstan, lads; hurra! the anchor's up. Away she goes with her studding-sails set, like a lonely bird, over the ocean. The breeze is freshening. In with the studding-sails—reef the topsails—and now for some of the delights of sailing. Hear ye those horrible sounds of pain and wo, which break from one side of the deck? Hallo! it is by no means a solitary case. Half a dozen now are with their heads over the gunnel, looking wistfully at the gurgling waters, at the same time making sounds by no means expressive of inward satisfaction. More are rising out of the hold, the hinder pressing upon the leaders. They are staggering about the decks. And the chill foam scatters its spray over them, baptising their clammy foreheads; and the drizzly rain has commenced, and the moaning wind is rising a key higher, and the waves sound surlier, and the word is passed, loud and decided, "All hands below but the watch." So the languid wretches descend again into the dark and noisome gulf, groping, sick and tottering, to their hammocks.

The night drearily passes over. With the morning the weather is clearing; but the sun shines ghastly and faintly. Nevertheless, up with the hammocks for airing—orderlies of companies attend for the rations—hark! the drum beats all hands to the grog tub—rum diluted with water, to be drunk at the tub, in presence of the orderly officer. Who is for the day? Ensign Muggins. Poor fellow! here he comes, looking very rueful. The smell of the rum is not likely to revive him; he has got hold of one of the ratlings; depend upon it, he will "screw" his courage to the sticking place.

"Well, Muggins, old boy, how are you getting on?" sung out Hopkins, the captain of the day, as his head peered up from the companion-ladder, on a level with the deck—his face, the colour of saffron, assuring the beholders that his stomach was no stranger to curry and rice—in short, that he was an old stager, well backed by a tropical sun, and knowing in all the ways of voyagers.

"Very seedy, Hopkins, very seedy, indeed," replied Muggins; "who could ever have imagined that all this misery was attached to the army? It was running after castle guard-mounting in Dublin, and field days, that turned my brain—only I was a fool, I should not be here—my stomach feels as if it were turned inside out."

"Ha! ha! ha! my lad, too late—too late to be grumbling—why did you list? Why did you list, Master Muggins?" chuckled Captain Hopkins; at the same time, striking a light, he commenced smoking a cigar, as much as to say, "I bid defiance to sea sickness."

"I would give fifty pounds I was well enough to smoke," sighed out Muggins.

"All in good time," said Hopkins; "you cannot expect to be a sailor in a few hours; but, Muggins, my boy, sick as you are, let me give you a little good advice. There are married officers aboard, and some of them have got daughters; take care of yourself, my boy, for, ten to one, when your sea-sickness goes off, you will get love sick. I have not crossed the line for nothing. An old bird is not caught with chaff. Observe, they will get up dancing when the nights are fair, and round games when they are wet, and get excessively intimate with each other; and before the voyage is over, the half of them will be by the ears, or my name is not Hopkins. But just take a cigar, and blow a cloud; be civil to them, and nothing more. On no account put your heels in a passion with that old paymaster's daughter; you may depend upon it, sir, they have no tin—not a piece. They may know how to draw, but not on the bank. I see they have brought a piano aboard; but I am happy there is no room to put it up. But dancing they will have, if they have nothing but the fifes. But here comes the orderly sergeant. Well, Sergeant Pikestaff, what's the matter?"

"I have brought up Lance-corporal Rooney, sir, for fighting with private Tim Doolan of the —th, thinking it highly unbecoming conduct, and subversive of military discipline in an acting corporal."

* "Ungrateful country of mine, thou shalt not possess my bones!"

Digitized by Google

"Your honour," says Tim Doolan, "Lance-corporal Rooney fetched me a dig under my right lug, from the effects of which I am nearly deprived of my hearing; and, further, he knocked my cap clane off my head overboard—sorra the sight of it I ever saw after—and tould me I was an Orangeman, though it's quite the reverse I am; and thin he offered to box me on the forecastle, your honour."

"Well, Corporal Rooney, what have you now to say?" asked Captain Hopkins.

"Why, sir, he aggravated me, and threw reflictions and disparagements upon our rigimint. Says he, 'You, and the rest of your corps, are a set of spalpeens. When ye marched into Mullingar, it was ye that claned out our mess tins, as if ye had ate nothing for an entire week of Sundays, and never gave us in return as much as a dram, or blast of a pipe, or a mouthful of tobaccy. And as for yourself (maning me, sir), you think yourself a very fine fellow, since you got that *stripe* upon your arm. You are getting as proud as one of Paddy Wall's pigs, and in two hours I wouldn't matter much pulling your dirty nose.' I couldn't stand him at all, at all, sir; I tould him he'd better keep his jaw to himself, that I was as good a mother's child as he was any day, and that it was a dirty mane thing of him to be casting up about the bit and sup that his rigimint gave ours whin we came off the march. It was only jist what the likes of any rigimint would do to another in similar circumstances. Upon this, your honour, he spat in my face, and thin I gave him a dig, to show him how to observe politeness and manners for the futer; told him though I had a *stripe*, that would not be the rason of privinting me giving him satisfaction; and that, if he plased, I would take a round out of him on the forecastle; and there's the story for your honour. His cap did go overboard; but I am willing to pay for it, if you will only look over the business this time, and I will promise you I will give Tim Doolan a wide berth for the futer." "On the promise you have made, I will pass the thing over this time; sergeant, the prisoner is forgiven. Now, Muggins," resumed Hopkins, "you see how these fellows are beginning already. Wait a little, and the bickerings will break forth in the cuddy; but here comes the paymaster's wife and her darlings. Why, they look as if they were all in the measles; but I must say something to them. How do you do, Mrs Moneypenny? and you, Miss Eliza? and you, Miss Jane?"

"Oh, laws! Captain Hopkins, oh, laws!" exclaimed Mrs Moneypenny; "what is to become of me and my poor dear lambs—we are nearly devoured by vermin. You might sweep the bugs together, and take them up in handfuls. Oh! my dear Captain Hopkins, what is to become of us?"—and Mrs Moneypenny and daughters burst individually and collectively into tears. "Why, it is distressing, no doubt," replied old Hopkins, at the same time trying to repress a sardonic grin; "but I assure you, Mrs Moneypenny, it is only a trifle in comparison to what you will suffer on your landing, from the mosquitoes." After delivering this delightful piece of information, he glided to his cabin, chuckling at the idea of having sold old Mother Moneypenny a real bargain.

"There is one comfort," soliloquised young Muggins, aside; "there are others uncomfortable aboard this ship besides myself; at all events, if the Misses Moneypenny do not improve in their looks before the passage is over, there is no fear of my falling in love with them. But the bell rings, and there goes the black steward. Better, again, there goes the dinner. I will try what a little soup will do for me." And in stalks Ensign Muggins into the cuddy.

The cuddy was a long narrow cabin, not across the ship, as the general arrangement is, but running lengthways, or, nautically to express it, from fore to aft; about nineteen feet long and ten broad, with small cabins for officers on each side. In this miserable hole about twenty-five persons were crammed daily, to eat pea-soup, salt pork, junk, and, as long as the fresh provisions lasted, a portion of the same. A life of this kind, day after day, is very monotonous. Sometimes a distant sail may appear on the horizon. An attempt is made to speak her in vain; she is on the other tack. A shark perhaps has been caught, and a crowd gathers on the deck to gaze at the dying monster. One day a calm—then a storm; a lull—and then a sudden squall; but, to make the passage quick, after a certain time Madeira is made, and the Cape de Verds are passed; by this time the passengers are fulfilling Hopkins' predictions fast—going it tooth and nail. Eight weeks are passed. By observation, we are in the latitude of the Cape of Good Hope. The poor skipper is nearly driven mad by the continual dictation and interference of the passengers; one set begging him to put into the Cape; others, thinking it will only finally keep them at sea longer, are averse to his doing so: he quarrelling with his mates, and his mates with him; even the black steward, seeing how affairs are going on, has mustered courage, and given him impertinence. This is too much for the enraged skipper; he seizes the astonished nigger by the pell, and bundles him out of the cuddy.

Lieutenant Jenkins of the —th, has received a challenge from paymaster Moneypenny, some particularly good-natured person having informed the paymaster that Lieutenant Jenkins made some highly improper remarks on Miss Moneypenny the preceding evening, while she was walking on the quarterdeck with Cornet Twaddle of the —th. Mrs Moneypenny, furious, and adjuring her better half to have no mercy upon that odious young puppy Jenkins.

Mrs Flannigan has been in hysterics since morning, on account of some person or persons unknown having thrown her pet lapdog Fidele overboard. Brevet Major Flannigan, the senior and commanding officer aboard, outrageous at the act, swearing if he only knew who it was, he would bring the offender forthwith to a court-martial, and have him tried for disgraceful conduct. Old Hopkins is generally suspected for the vile deed. The lapdog invariably showed a marked antipathy to him, cocking its tail, showing its teeth, and snarling at him, whenever he made his appearance on the poop. And the skipper is in an awful humour again, having detected some of the officers' ladies sweeping the almonds and raisins by wholesale into their laps, for their squalling young brats. Great interest making to get the black steward reinstated in his office, from which he had been lately ejected. Rough weather again—in with the dead lights! The Cape is passed—weeks roll on—fresh provisions nearly finished. The old cock that crew every morning had his neck twisted this afternoon; there he swings, suspended by the legs, from the ratling. The hen-coops look most melancholy. They are tenantless—not even a quacking chick left, and the Isle of Ceylon is not yet reached. The old hog—the only survivor of the live-stock—is to be sacrificed to-morrow; the beer is out, and the water ebbing very low; two sentries on the water casks. This looks blue. Passengers by this time something like caged tigers. "Land ahead"—joyful sound! "There's Adam's Peak," shouted out old Hopkins, as the mist cleared off, and the crags of the noble mountain glittered in the morning sun, and the tops of cocoa-nut trees, that gird the shore, looked green and fresh to eyes that had rested for months on the tossing billows. And now the canoes are approaching, with their outriggers, like ploughshares—and the flag-staff is signalising—and the naked and graceful-figured Cingalese stand on the deck to sell their plantains and cocoa-nuts—and the moor-men sailors, with their shaven heads, are rowing lustily, the oars keeping time with some wild chant. The staff officer has come on board with directions:—"The men to disembark in the evening."

They have disembarked; what a dark ridge of cloud canopies the distant jungle! Hark to the distant growl of the pent-up thunder! What a lightning flash! Peal upon peal re-echoes through the startled hills. The shaken clouds discharge their fountains of waters—the roads are converted into rivers. "Right shoulders forward." Huzza! they are now marching into the fort, drenched by the pitiless shower; but any port after a transport. The voyage is over; and the detachments, in their several quarters, sleep without rocking in the Fort of Colombo.

THE UNFORTUNATE SAILOR.

In the Memoirs of the Life of Sir Samuel Romilly, lately published, we find the following account of a case in which, as solicitor-general, he was engaged in 1807. It is impossible to read it without feeling impressed with a degree of horror at the indifference with which human life was legally, and often wrongfully, extinguished thirty or forty years ago:—

"A case has been lately laid before the attorney-general and me, by direction of the Lords of the Admiralty, to consider of the expediency of prosecuting for a libel the printer of a weekly newspaper called the *Independent Whig*; which has brought some facts to our knowledge that demand the most serious attention. A sailor, of the name of Thomas Wood, was tried by a court-martial at Plymouth on the 6th of October last, on a charge of having been concerned in the mutiny and murders which were committed on board the Hermione. It was in September 1797 that the mutiny took place; and the prisoner being only, as was supposed, of the age of twenty-five when he was tried, could not have been more than sixteen when the crime was committed. The fact was proved but by a single witness: that witness, however, who was the master of the Hermione, swore positively that the prisoner, who, he said, at that time bore the name of James Hayes, was the very man whom he remembered on board the Hermione; and that he saw him taking a very active part in the mutiny. Notwithstanding the positive oath of the witness thus identifying the prisoner, yet, as the witness said that he had never seen the prisoner since, and as the appearance of a man generally changes very considerably in the nine years which elapse between the ages of sixteen and twenty-five, little reliance could be had on such testimony. It was, however, the only evidence in support of the prosecution. But what was wanting in the evidence for the crown was supplied by the prisoner's defence. It was delivered in writing, and was in truth a supplication for mercy rather than a defence. The following passage contains the whole substance of it:—'At the time when the mutiny took place, I was a boy in my fourteenth year. Drove by the torrent of mutiny, I took the oath administered to me on the occasion. The examples of death which were before my eyes drove me for shelter amongst the mutineers, dreading a similar fate with those that fell, if I sided with or showed the smallest inclination for mercy;' and then follow entreaties for compassion on his youth, and a declaration that he had not enjoyed an hour's repose of mind since the event took place. The court found him guilty; he was sentenced to be hanged; and on the 17th of October the sentence was executed. In the mean time, his brother and sister, who were in London, heard of his situation, and made application at the Admiralty. They insisted that their brother was innocent; that he was not even on board the Hermione, but was serving as a boy in the Marlborough, at Portsmouth, at the time the mutiny took place; they procured a certificate of this fact from the Navy Office, and transmitted it to Plymouth, where it arrived previous to the execution. The guilt of the prisoner, however, appeared so manifest from his own defence, that no regard was paid to the certificate, and the execution took place. This proceeding was animadverted on in the *Independent Whig*, in several successive papers, with very great severity. The members of the court-martial called upon the Lords of the Admiralty to punish the author of these libels; and, in consequence of this, they were laid before us. The attorney-general suggested, at the consultation, the propriety of making some inquiry into the fact before the prosecution was instituted. We neither of us entertained any doubt of the man's guilt; but yet the attorney-general thought that it would be advisable to be able to remove all possible suspicion upon that point. An inquiry was accordingly set on foot by the solicitor of the Admiralty; the result of which was, that the man was perfectly innocent, and was at Portsmouth on board the Marlborough when the crime was committed in the Hermione. He had applied to another man to write a defence for him; and he had read it, thinking it calculated to excite compassion, and more likely to serve him than a mere denial of the fact."

We hear nothing of the prosecution of the villanous captain for the crime of perjury, in this truly affecting case of legal murder.

RAILWAY CHARGES.

In our late article on the English railways, we omitted to notice that nearly all the companies have committed the mistake of making the fares of transmission too high. The charges are unquestionably lower than those of the mail or stage coaches; perhaps, in general, they are but one-half: but this is not the point. Comparisons, in any shape, with the old stage-coaching practice, are now entirely out of the question. The serious matter for the consideration of the railway companies is, whether they could not realise a much higher revenue by charging in all cases lower fares? Our belief is, that they would; and we appeal to the example set by Belgium, as well as by a few companies in this country. Let us quote, on this subject, the following evidence from the "Inventors' Advocate, and Journal of Industry:"—

"Travelling has hitherto paid by the first-class Belgian carriages at the rate of 5 per cent.; by the second class, 9 per cent.; by the third class 32 per cent.; and by the fourth, or lowest class, 54 per cent.! There is no mistaking the principle which these facts go to establish, the more especially that the whole course of experience in France and America corroborates the same thing. Nor is the result as regards carriage of goods less striking and satisfactory. In Belgium, the income from this source has mounted up progressively during the past three years from (to use round numbers) 17,000 francs, to 104,000 and 130,000, and is expected shortly to cover all expenses, leaving the travelling fares untouched, as a source of clear profit.

In this country the railway companies have been averse to recognise and act upon the great and publicly beneficial principle resulting from these experiences. Beginnings, however, have in a few instances been made, and these having fully borne out what was predicted of them, there is every reason to believe that the force of public opinion, and the gradual attainment of more enlightened views of self-interest, will effect the rest. Of the beginnings that have been made, we shall give the following examples from the records of the Manchester, Bolton, and Bury railway, and of that between Leeds and Selby. On the former of these, the following rates were charged up to 12th July, 1838:—

Passengers in covered carriages,	1st class,	2s. 6d.	each.
Do.	do.	2d do.	2s. 0d. ...
Do.	open do.		1s. 0d. ...

During the six weeks ending the 12th July, as above, the number of passengers conveyed at these rates was 26,579, and the fares received from them L.1911, 6s. 9d. The fares were then reduced to

1st class, - - - - - -	2s. 0d. each.
2d class, - - - - - -	1s. 6d. ...
Open carriages, as before, -	1s. 0d. ...

And in the six weeks ensuing, the number of passengers rose to 35,128, and the amount of money received from them to L.2129, 7s. 9d. On subsequently raising the fares to their old level, the number of passengers and sums they paid, fell back to their former proportion, showing clearly the true cause of the increase and decrease.

On the Leeds and Selby railway, the fares charged in 1835 were—3s. on first-class trains, and 2s. on the second do.—number of passengers 100,895. In 1836, the fares were raised to 4s. first, and 3s. second class—number of passengers only 88,957. Next year, the fares were still farther raised to 5s. first, and 3s. second class—number of passengers still falling, and now so low as 70,625! In 1838, this course of selfish error began to be retraced; first class being lowered to 4s., and the second to 3s., and the effect followed its cause as naturally as water seeks its level—the number of passengers rising to 90,637. Other more recent examples of the like kind could be added; but even one demonstration so full and unanswerable as the two just given, is as good as a thousand. Let our railway companies, then, listen to the voice of these examples, and be satisfied, that on this point their interests and those of the public are identical."

Column for Little Girls.

THE TWO SISTERS.

[Abridged from a volume for the young, called "The Hartopp Jubilee, or Profit from Play," by Mrs S. C. Hall. London: Darton and Clark. 1840.]

"THERE are many clever women (said aunt Dacre to Ellen) who are not good, and many good women who are not clever. I will tell you a story; it is some years since I first knew the parties; I have, therefore, had an opportunity of ascertaining the termination as well as the commencement of their career.

My dear mother had been ill for some time, and change of air being recommended for her, we went to Ramsgate, at that period a place of very fashionable resort.

We took a letter of introduction from our own physician to a medical gentleman there; and that gentleman had two daughters, Sarah and Olivia Lambert.

Sarah at that time was about eighteen; her sister a year younger. I was the junior of both.

Olivia Lambert was one of the most brilliant and showy girls I ever met; their mother died when they were in early childhood; it is more than probable, if she had lived, the good doctor's family would have been much better regulated. Olivia's beauty, for she was really handsome, was of a striking nature; the moment she entered our drawing-room, we all thought 'how beautiful she is!' and when Doctor Lambert went to our mother's chamber, we gathered round the young lady, anxious to ascertain if her mind had been as much cared for as her person, for she was expensively dressed, and appeared to have bestowed considerable labour on self-decoration."

"But clever women are never well-dressed, are they, aunt?" asked Ellen.

"It is part of a woman's duty to be neatly and becomingly dressed according to her station in life," replied Lady Dacre; "and a clever woman who neglects this, proves that her mind has been imperfectly cultivated.

Olivia Lambert's mind had been also adorned to a certain extent. The seed of many things had been sown therein: but the seed was not of the best quality, it had got sadly mingled with that of weeds. And the weeds had almost choked the fair and beautiful flowers, which otherwise might have flourished luxuriantly, and brought forth good fruit.

We saw in a few minutes that she possessed a ready wit; she never seemed at a loss for an observation or a reply: but ready wit is apt to intrude itself unnecessarily, and is sadly fond of display.

Your mamma, who had less courage than myself, shrunk from her when she made this discovery, for she feared her powers of ridicule, and knew that she never could enter into a war of words with a clever young lady. Miss Lambert quickly informed us of the sums of money her papa had lavished on her education; and said that she was resolved to do something great before she died, for that she could not bear to live unknown, or die unremembered. Such a declaration made to those she had never seen before, betrayed great presumption, and want of knowledge of the customs of society; but she looked so handsome, and withal, had something so frank and friendly about her, that we continued to listen, and she continued to talk about herself.

She told us she wrote poetry, and offered to sing us one of her own songs; her voice was very pleasing, and the words of the song evinced a good deal of talent."

"She was really clever, then?" said Ellen.

"She was, as I have said, to a certain extent; there could be no second opinion about the matter. She was, poor thing, very clever; but unfortunately every body told her so, and she was so perfectly aware of the fact, that, satisfied with the possession of what she so constantly heard extolled, she did not use any exertions to acquire those virtues and amiabilities which are the only real foundation of female excellence. It was certainly rare to meet so young and so beautiful a creature gifted with so much ability in so many ways: but it was painful to see the petty arts she used to attract admiration, and the craving she felt at all times for praise.

We promised to call on her the next day, for we had not many acquaintances, and Doctor Lambert's extreme attention to our dear mother made us anxious to show any kindness in our power to his children.

'Oh! I shall be so glad to see you,' she exclaimed; 'I will show you my themes—and my lecture—my own invented patterns—and my ring, that was given me by papa for my arrangement of one of Rossini's airs. I will also introduce you to my sister Sarah; I am sure you will love her; every one loves Sarah; but I may tell you that you must not expect any thing extraordinary from her—nothing but extraordinary goodness. Papa calls *her* his right hand; and *me* his right head. Dear, kind Sarah—she sings very well indeed, and speaks one or two languages; but, being the eldest, she has not had time to cultivate her talents. *One* must be housekeeper; and she is so fond of being useful. I am sadly useless; Sarah even superintends my dress; tells me what I am to wear; and takes care of me. She is not a clever girl; and consequently can attend to every domestic thing.'

"Sarah was quite as handsome as her sister; but the expression of her countenance was different; it was modest and subdued; she had also a care-taking look, as if she did and thought a great deal; perceiving that Olivia had shown us some of her drawings, she expressed her sorrow that she had not leisure to cultivate an art she dearly loved; but added, that her sister possessed so much more talent, that she was glad her own attention to their domestic duties enabled her to pursue those occupations in which she was so eminently qualified to excel. Presently her father entered, and then the same flattery was repeated as before. It was evident that, though Doctor Lambert loved his eldest daughter, he regarded her as a sort of domestic drudge, with no more intellect than was necessary to keep the house-books, and economise; while Olivia was regarded as something wonderful; something so wonderful, that the study of his life seemed to be how to add to her accomplishments, and increase the admiration which her beauty excited, by accounts of her wit and talent. Olivia said so; Olivia did so; Olivia thought so; in short, I never saw a man, sensible upon all other subjects, so completely astray in the management of his children. If the young ladies had divided the house duties between them, each would have had sufficient time for amusement and study; but *one* had so much to do, that she really led a life of slavery; the other so little, that, despite all she learned and all she read, and all she displayed, time hung heavily on her hands. Now, my dear Ellen, though Olivia was at first a generous, open-hearted girl, finding persons, particularly in her own family, always ready to bow down to her, made her, in time, both arrogant and capricious. What she learnt, her fine abilities enabled her to learn with so much ease and rapidity, that she neglected every thing to the last moment; and when her masters ventured to complain, she managed, with a sad and dangerous dexterity, to turn the tables on *them*. So that her habits became careless; and as a young and beautiful tree of rapid growth is bent by every passing wind unless properly supported, so Olivia's plans and intentions were constantly overthrown, because she had no prop, no stay; she fancied she had sufficient strength of herself to help herself; and, poor girl, she was so much admired, that no one sought to undeceive her.

As for Sarah, it was difficult to know what points in her well-proportioned nature deserved the warmest praise; her gentleness, her modesty, her freedom from affectation, or her self-denying and uniform attention to her sister, whom she evidently considered as a gifted and superior being; this last was the only weakness I ever perceived in a character which otherwise I should have considered faultless.

Her devotion to her was quite extraordinary, for her own mind, though less brilliant, was more solid; and her acquirements, though less showy, more substantial. We all *admired* Olivia, but we *loved* Sarah. Doctor Lambert found it necessary to receive a great deal of company, and it was wonderful to observe the excellence and good order of his daughter's arrangements, although her pale cheek often assured me she was over-fatigued; for, where there is not a large establishment, it is necessary for the lady of the house to take a very active part in household arrangements. The indifference with which Olivia witnessed her exertions often astonished me, for she would talk of tenderness and sisterly affection by the hour, though still her poor sister toiled on.

Our beloved mother became convalescent, and we quitted Ramsgate. I was never hasty in forming friendships; but I was honoured by the regard of Sarah Lambert, and we felt an attachment for each other which nothing but death could destroy. I was a gainer by this fortunate circumstance, for she had sufficient power over me to make me both read and think; and I am greatly indebted to her for having used that power to my advantage.

We heard constantly of Olivia's beauty, Olivia's wit, Olivia's talent; and the production of a small volume of poems, printed only for private circulation, swelled her triumph to the utmost. This was the brilliant side of the question. Others spoke of Olivia's conceit, Olivia's temper, Olivia's habit of undervaluing others; and said that her father had acted foolishly in giving even a restrained publicity to the unripe fruits of a brilliant but thoughtless mind; that what was pretty and interesting to a home circle, was neither one nor other to a more public one; and that there was much fear of Olivia increasing in conceit more rapidly than in learning. Beauty has its admirers, but it also has its enviers; and the young lady's conduct was such as to invite criticism, rather than disarm censure. Her father's house became the rendezvous of all such persons as either possessed, or desired to be considered as possessing, talent; and of all the lounging gentlemen who liked to see something strange, and admire beauty. Sarah maintained the even tenor of her way, seeking, for her father's dear sake, to eke out an income by no means as large as it was represented to be, and only anxious that the doctor should be prosperous, and her sister admired. I was greatly pained at receiving a letter from her one morning, saying that her father had been very ill for some time, and that she wished I was near her, adding, she knew how vain the desire was, for the town was full, and I could not be spared in the merry month of May: it was, I well remember, just this time twenty-five years; but gaiety never yet destroyed my sympathy, and though I was engaged at the time to be married to Lord Dacre, I obtained my father and mother's permission to fly to my friend.

I found the good old doctor even worse than Sarah's letter had led me to expect, and understood from himself, that if he died, his children would be left almost without provision. 'For dear Olivia,' he said, 'I have no fear; her talents, if she should be obliged to exert them, will win her both fame and fortune; but my poor Sarah! my good, pious, useful Sarah!' and he extended his hand to the really useful girl, who pressed it to her lips, while she turned away to hide her tears, and replied, 'Do not fear for me, dear father, be your days few or many, God will provide for me, by enabling me to work for myself.'

'She is an angel,' he said when she left the room. 'It would have been too much to expect that God should have given me *two* children endowed with Olivia's talent, but for all that Sarah is indeed an angel!'"

"And while Sarah was attending her father, aunt," inquired Ellen, "where was Olivia?"

"My dear, Olivia had never been taught to command her feelings; consequently, even if she had been inclined, *her* sphere of usefulness must be very contracted. I believe she loved her father; she wrote a great many beautiful poems on his death (for he did die); but, during his illness, particularly after his case became hopeless, she used to go into hysterics whenever she witnessed his sufferings, and consequently was unable to alleviate them. To the very last Doctor Lambert consoled himself with the belief that Olivia would meet troops of friends, and establish for herself fame, and gain for herself riches. He knew that for her sake he had lived beyond his means; that he had entered into expensive society that she might shine; and he trusted that her talents had been properly cultivated.

I never loved Sarah so much as I did when I was acquainted with her virtuous exertions to obtain independence; I was proud of her friendship—I studied to deserve it; I hope I did deserve it. I was often angry with Olivia, for she would not draw, because she could not obtain the price she thought her pictures deserved. She would not go out to teach, and she did not understand music as a profession sufficiently to receive pupils at home. She was frequently invited out; but because she could not dress as gaily as she had ever done, she refused to go at all into society. But the cup of her sorrow was not yet filled; she was not yet sufficiently humbled; Sarah had stood between her and her griefs, whether real or imaginary; but it pleased God that this excellent girl should be afflicted with a heavy and sudden illness; this awoke Olivia to a sense of her duties; she saw, as if a film had been removed from her eyes, that her sister had been taxed beyond her strength, and that, too, by her indolence and her vanity; the knowledge was painful, but it was true."

"Well, dear aunt," inquired Ellen anxiously, "but it did her good; it changed her, did it not? and she rewarded this dear sister, and became a useful member of society?"

"My dear Ellen," replied Lady Dacre, "it requires the exercise of a strong and vigorous mind to change suddenly and completely from pride and indolence to humility and industry. I hear of such changes; but I have seldom seen them. Olivia certainly did change; but as regarded her dear sister, it came too late."

"Oh, aunt! Sarah did not die?"

"She did, my dear. She died with her head resting on my shoulder; her hand clasped in that of her sister. While she lived, even I did not know all her worth; she had laboured night and day; she had undermined a constitution, never strong, by unmitigated labour; and she sank into her grave at the age of six and twenty, just as her prospects were brightening; for if she had lived, she would have been married to a near relative of mine, who appreciated her virtues, and longed to see them rewarded. But she had her reward, Ellen; she enjoyed the consciousness of having done her duty in that state of life in which it had pleased God to place her. She had learned to trust in the mercy and loving kindness of the Almighty; and her death-bed was one of peace and joy."

"And her sister?"

"Alas! my dear, Olivia tried—I believe sincerely—to be useful. Those who had given Sarah an opportunity of exerting her talents, and to whom she had become endeared, encouraged her good intentions; but bad habits, acquired early, are hard to overcome. She could not bring down her spirit to the level of her circumstances, and was perpetually reverting to what she had been, instead of making the best of what she was. She missed the luxuries which custom had rendered necessaries; and her friends, or rather those who transferred to her a portion of the friendship they had bestowed upon her sister, grew gradually tired of giving to a discontented person.

We went abroad for some time; and on our return, I inquired for the once beautiful Olivia, whom we thought we had not left without the means of respectable subsistence. Alas! we found her ill, and without friends—her loveliness had been *rubbed out* by fretfulness—its charm was gone—her accomplishments, always showy and imperfect, had ceased to yield enjoyment; for she only prized them as a means to obtain the admiration she no longer excited: poor and neglected, this once brilliant creature inhabited a wretched garret—and" ——

"But you did not leave her there, aunt? Neither you nor mamma, nor grand-mamma, nor any of those of Hartopp Hall, would leave her there," interrupted Ellen, struggling with her tears. "If she had been properly brought up, she would have been very different, and would have known how to use, and when to use, her talents. And besides, she was Sarah's sister; and grand-mamma might easily have put her into one of those dear nice cottages that grand-papa won't allow to be called alms-houses, because they are inhabited by those who never asked an alms. Oh! aunt; I see by your face that this was done. And, I am sure I know who she is—the tall, pale, lady-like woman, who told grand-mamma one day that the roses did not grow fast enough to shade her window, and who has a little village maid to wait on her. Well! I am glad she is not dead. I wonder does she often remember her gay days. I remember one day last summer, she kissed Rose, and said she was very pretty; but not to be vain of it, for it would fade—and not to be conceited. It is a great change, though, for her—is it not?"

"It is, my dear: but it is our duty to be thankful for the blessings we enjoy, and not to regret those we have lost. When I look at her poor hand, deformed by that cruel rheumatism, and remember how beautiful it looked upon the harp, I am tempted to repine with her; but when I also remember how necessary it was that her conceit and pride should be subdued, I think of the mercy of God, who, while he taught her humility, did not desert her utterly.

Such, my love, is the history of 'THE TWO SISTERS,' and I hope it has given you a lesson as to the folly of setting so much value on cleverness, unassisted by more feminine qualities."

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with titlepages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 444. SATURDAY, AUGUST 1, 1840. PRICE THREE HALFPENCE.

ROOM AND RATIONS.

TILL about forty years ago, there was a comfortable doctrine in the world, that children were a good thing, and that it was desirable to encourage population. Louis XIV. actually went so far as to give pensions to men who had more than ten children; and there were few European states in which he who had three or four did not get a discount from his taxes. But since then, a most melancholy notion has taken possession of the brains of politicians, namely, that population requires rather to be checked than encouraged, seeing that, if allowed full head-way, it is apt greatly to outstrip the increase of the means of subsistence. It is not very likely that many marriages and births have been prevented in our islands by this doctrine. Somehow, people fall in love and marry without much regard to theory, and children come into existence in loud defiance of all that can be said to the contrary. Every day that rises on our islands sees a thousand more human beings squalling upon them than what were squalling the day before; and it is rather remarkable that our total numbers have increased more since this damping doctrine came out, than they did for perhaps a century and a half before. Nevertheless, the doctrine is certainly an oppressive kind of thing, particularly to old bachelor gentlemen who would not marry at any rate, and it would be quite as well that people with large families were relieved in the eye of the public from all charge of contributing to some future famine.

The doctrine appears to be a very sound doctrine when taken by itself. It seems undeniable that, if ten pairs were planted on a small island, which could only produce sufficient aliment for them and forty other persons, that is, four children to each pair, or fifty in all, there would only be occasion for as many marriages as might keep up the population at fifty, and that, if all the forty children were to marry, and have for each pair four children, that is, eighty in addition to the first number, a famine would ensue. But such circumstances as these do not exist in the world. As things are constituted, the new population could either remove to some neighbouring island and plant new settlements, or they could exert manufacturing industry in their original home, and, with the goods they produced, purchase food from some neighbours who chanced to have a wider range of cultivable ground. There might even be a third alternative, for, under the pressing anxiety to provide for the new mouths, they might exercise so much ingenuity and activity in increasing the productiveness of their own soil, that it would support the increased population. These expedients are not adopted to the extent they might be: there is a disposition to prefer the natal soil to every other; political regulations in some cases prevent food from being bought in from a distance; and men are often found very sluggish in adopting means for increasing the produce of their own soil. But where such is the case, the necessary consequence is that marriages are fewer, and the progress of the population is restrained—unless, indeed, where, from some unlucky combination of circumstances, so low a point in the scale of poverty has been reached, that people become reckless of consequences. Certainly, it may generally be affirmed that, where all social regulations are on a right footing, and no marring accident takes place, population may be safely allowed to go on at its natural rate of increase, *if* men will only hold themselves prepared to go to new ground, or to make the old more productive, or to labour for the means of purchasing food from remote fields of production.

Allowing these to be sound principles, it may be worth while to make a little inquiry into the means which nature has yet in reserve for supporting an increased population, both with respect to room and to capabilities of increased production. Most people are of course aware of there being vast unoccupied countries in the world, and that scarcely any districts now under cultivation might not produce much more than they do; but probably few have distinct ideas on either subject.

No result of geographical science is, in our opinion, more remarkable than the different amounts of population in comparison with space, which are found in various countries. The British islands, with 91,000 square miles and an estimated population of 23,400,000, support 257 on every square mile. Some of the other enlightened countries of Europe exhibit a rate somewhat similar. In France, it is 208; in Holland, 262; in Germany, 193. Belgium, with its numerous busy towns within a narrow space, rises considerably higher; the rate is there 453. Switzerland, containing much mountainous ground, but a very industrious people, gives 177. Italy, with a fruitful soil, and many populous cities, supports 249 per square mile. On the other hand, Spain, with its numerous sierras and its little industry, gives only 101; Portugal, 121; Sweden and Norway, with vast alpine wildernesses, have only 17. Russia, full of desolate plains, and with an enslaved populace, gives 35. Turkey, where there is equally little or less freedom, but more fertility, exhibits 63. Prussia and Austria, again, are at such a medium as might be expected from their soil and climate and their political institutions, being in the one case 155, and in the other 165.

Europe contains in all 2,812,532 square miles, and 230,672,000 people,* which gives an average of 82 to the square mile. Now, when we consider that some parts, in no way specially favoured by nature, and where agriculture chiefly is depended on, contain so many as 208 to the square mile (France is in this case), we cannot well doubt that there would be room for many more people in Europe, supposing it were all brought up to the very moderate point in agriculture and manufacturing and commercial activity, which France has already attained. If we go on to suppose a general improvement in agriculture, such as has taken place in Great Britain, a still farther increase to an almost incalculable amount might be admitted of. For four millions of quarters of wheat grown at the beginning of the reign of George III., England now raises twelve millions, or thrice the former quantity. By a single improvement, the introduction of bone manure, some lands have of late years been producing five times their former crops of turnips. Tile draining is making one piece of land worth what two once were, all over the island. Of course, there is nothing to prevent other countries from following similar plans in tillage and husbandry, and thus becoming capable of supporting an immensely larger number of people, or of exporting food to other countries in exchange for useful articles.† But even Britain is by no means come to an ultimatum in agricultural improvement. In England there are eight millions of acres of waste land; in Ireland there are five millions; all of which might be improved and made productive, if the right methods were taken. Here there is evidently room for a vast increase. The late Sir John Sinclair was of opinion that Great Britain and Ireland could of themselves produce food for a hundred millions of people, or four times the present number, if the soil were turned to such advantage as even the present state of science admits of. We have not the least doubt, when we contrast the bulk of the country with such pattern spots as Haddingtonshire, and consider the land which is entirely waste, that Sir John's calculation is not beyond the mark, laying aside all consideration of what further capabilities may be discovered hereafter by science, and realised by enterprise, skill, and capital. This would give us a *population of one thousand to the square mile.* Now, the one-half of Europe, being equally or more favoured by nature than Britain, must be capable of supporting a population of that amount also, or, in all, rather more than 1,400,000,000. Take the remainder at only one-third of the same rate, and we have as many more as makes up the full amount to 1,868,755,000, or upwards of *seven times more than the present amount.* No doubt, many favourable circumstances must be supposed before we can expect such a result. War must cease; the minds of the nations must be enlightened, and, as a consequence of the latter circumstance, political regulations must be based, not upon narrow and false views of the interests of nations or of sections, but on principles of universal justice, and with a regard to the good of the whole. These are results which cannot be expected soon, but which must in time be realised, for, notwithstanding occasional oscillations, there is a tendency, and a constantly increasing tendency, towards them.

Asia is four times the size of Europe; but one-third part of it, Asiatic Russia, is an arctic wilderness which does not support one human being per square mile, and the Chinese empire, another third, includes the equally desolate and very large tracts of Mongol, or Chinese Tartary, so that probably a half of this great division of the world may be considered as scarcely tenanted at all. In the remaining half, several countries are nearly as well peopled as some of our European states in the second-best condition. Thus Japan, where agriculture is encouraged by the state in a very extraordinary manner, is so well cultivated, and, upon the whole, regulated with so much regard to the good of the great body of the people, that the population is 25,000,000, or 139 to the square mile. China Proper, where there is also a very active land-culture, is well peopled. The most moderate computation gives nearly 170,000,000. The population of the territories of the East India Company is also good in proportion to space, being 231 to the square mile.

---

* We take our computations of superficies and population chiefly from the "Abrégé de Geographie, par Adrien Balbi. A Paris: 1838."

† On this point we have some serviceable illustration in a passage of Mr Paget's recent work on Hungary*—a work, by the way, which we would earnestly recommend to the attention of our readers. The passage in question describes the estate of a Hungarian baron as extending to about *fourteen thousand acres*, but as being extremely unproductive, on account of the low state of rural economy in all its branches in that country. This estate, indeed, appears generally to be in the same condition as most estates were in Scotland about a hundred years ago. Our baron's oak-woods were, he confessed, useless in point of revenue, though he obtained firing and some gall-nuts from them. He had hitherto had scarcely any stock upon his grounds, because in winter the animals die for lack of provisions—exactly the case of our farmers before the introduction of turnip-husbandry. He had recently, however, got a Scotch steward or bailiff to introduce some improvements. This person, though beset with great difficulties from the untractableness and laziness of the peasantry, had brought a farm of *three hundred acres* into a high state of cultivation. He had barns and stacks to show, and fat oxen, and huge potatoes. The baron confessed that, though the outlay had been great, the produce was enormous: he had now *as much corn and hay from this little farm as from the whole estate formerly.*

It seems probable, from what Mr Paget states, that for every hundred persons whom Hungary and Transylvania now support in a very poor way and in a state of gross ignorance and rudeness, they might support a thousand at least, in comparative comfort and with the benefits of knowledge and refinement, if the productive resources of the country were fully developed.

* Hungary and Transylvania, with Remarks on their Condition, Social, Political, and Economical. By John Paget, Esq.

But all the rest of Asia, under the influence of wretched governments and bad moral systems, is but thinly inhabited. The "territories under British influence" are best—135 to the mile. In Siam and Birmah it is only 24; in Persia, 26; in Asiatic Turkey, 23. Taking the whole space at 12,385,430 square miles, and the entire population at 525,204,000, the population of Asia is only 42 to the square mile. Now, we assume the northern half of Asia to support at present not more than 10,000,000 of people, or not two to the square mile. Inhospitable as the country is, this must be much beneath its capabilities, and we cannot consider ourselves extravagant in supposing that it may yet be found supporting ten where it now supports scarcely two. This would give 60,000,000 as a pauper population for Northern Asia. Of the remaining half of Asia, we would set aside a third for the deserts of Arabia, Turkey, and Persia, leaving about four millions of square miles, to which no less capabilities can be assigned than those which have already been assigned to England: probably, considering the superior fertility of southern climes, we might be justified in striking a higher pitch. Even at this, which is obviously moderate, we find that Southern Asia, after all deductions for waste ground, is capable of supporting no less than *four thousand millions* of people, or more than four times the amount of the present entire population of the globe!

Africa is a difficult subject, so much of the interior being unknown, and the present population being so ill ascertained. Yet there can be no doubt, either of the great populousness of Africa, or of its ability to support many more than it does. A country which for ages has given about half a million of victims annually to the slave-trade, without any where shewing the slightest symptoms of depopulation, must contain no mean number of human beings. The Barbary states on the coast of the Mediterranean once contained a happy and thriving population of fifty millions; but now, under the selfish, merciless, and unenlightened rule of Turkish adventurers, the number is sunk to ten millions. This is in itself a striking proof of the high capabilities of at least some districts of Africa. Probably, then, we make no extravagant supposition when we assign to Africa two hundred millions, instead of the one hundred now usually placed to its account by geographers.

The spare room in America is enormous. This mighty continent, *six times the size of Europe*, or containing a superficies of 17,223,545 square miles, is believed to be inhabited as yet by only about forty-two millions of people, or at an average 2½ persons to the square mile. Yet, excepting the Russian and British territories in the north, and the southern parts of Patagonia, it is generally of such a nature, in soil and climate, as to appear capable of supporting a dense population. Even the parts under the equator, which in some other divisions of the world are hot and unhealthy, happen in America to be for the most part as temperate as the medium latitudes, in consequence of their being composed of table land at a considerable height above the level of the sea. We in this country have no adequate idea of the immense extent of fertile and most inviting soil which America exhibits in a state almost tenantless. Brazil, which is nearly as large as all Europe, is composed of rich land throughout, yet contains only about five millions of inhabitants, little more than the population of Portugal or of Belgium, the smallest of independent European states. The population of the splendid countries lately constituting Spanish America, and now formed into independent republics, has heretofore been kept low by a grinding and blindly selfish tyranny; but the prime evil is now removed, and though the political condition of these states is not yet so settled as might be wished, there can be no doubt that they are fairly in the way of improvement, and must advance in the career of industry and prosperity, and consequently become the seats of vast nations. All things considered, we believe we are speaking quite in moderation, when we express our belief that there is room in America *for ten thousand millions* of people—that is, ten times the present supposed amount of the human family.

The islands between the continents of Asia and America are computed at 1,828,100 square miles, with a population of fourteen and a half millions, or nearly eight to the square mile. Considering the ill-watered condition of Australia, we take this district of the world at a considerably lower rate than the better parts of the rest, namely, 250 to the square mile; the result of which is, that there is room in these islands for about four hundred and sixty millions. Here there is a better chance of a quick progress to population than even in South America, for the greater part of these countries will in a few years be colonised by British people, who will immediately begin to cultivate, and exercise all other useful arts from the first with the greatest activity.

The sum of all these calculations is, that the earth is capable of supporting *between sixteen and seventeen billions* of people, or about *eighteen times more than at present reside upon it*, even supposing that the whole were cultivated only as well as the *present state* of agricultural science admits of, and allowing scarcely anything for vast tracts, at present sterile, but which men may hereafter find the means of turning to account. It will of course occur to every mind that, considering the inferior natures of many races, a long time would be required to bring cultivation to such a pitch: no doubt; but so would it also require to people up the world to so vast an amount. In all the time that has yet elapsed since the creation of man, the population of the earth has only risen to about nine hundred and fifty millions. Probably it is not now a third more populous than in the days when Rome was its mistress. In fact, it is only within the last hundred years that population has been any where observed to increase considerably, and that only in a few countries where the peaceful arts had begun to be cultivated with earnestness, and in circumstances favourable to their progress. There is, then, little danger that the progress of population will exceed that of the means of supporting the increased numbers. The case seems to stand simply thus:—Here is a vast space for new tenants; here are wondrous and apparently indefinite powers in nature which may be turned to account by human ingenuity and industry, for the support of greater numbers on the same space; here is a moral law held forth, at the same time, that, if nations will live in amity, and deal justly towards each other, the reciprocation of their services will enable far more to live in the whole of the countries put together, than could subsist in those countries, supposing them all to be shut up from each other. Take advantage of these PROPOSALS OF PROVIDENCE, and you may increase; but, if you do not choose to do so, Providence offers no alternative but a restriction upon numbers, a rule of which the breach is unavoidably attended with misery. In past ages, while these laws were not understood, and a low intelligence and low morality alike prevailed, the tendency to increase must have been much under this check; but it is precisely one of the benefits which may be hoped for from increased and diffused knowledge, that hereafter the opposite course will be taken, and that moral, industrious, and enlightened nations will rapidly spread along the vast tracts, where, for countless thousands of years, Nature may have been said to be waiting for Man.

O'MALLEY, THE IRISH DRAGOON.*

"CHARLES O'MALLEY," the new production of the humour-loving author of "Harry Lorrequer," is, we think, even better than its predecessor, being equally amusing in the grotesque delineations of Irish character and manners, with less boisterousness of mirth and frivolity. We are glad to have it in our power to enliven our pages with the following specimen of the work:—

The hero, young Mr O'Malley, previous to receiving his appointment as a dragoon officer, is invited to a ball at Sir George Dashwood's in Dublin—an amusing college companion, Webber, requests to accompany him, to which receiving a nay-say, he declares to a companion, Power, that he will not only attend without an invitation, but also salute Miss Dashwood without being hicked down stairs for his impertinence—Power wagers a couple of ponies he don't. Having narrated this piece of negotiation, O'Malley proceeds to describe his preparations for the ball.

"I have often dressed for a storming party with less of trepidation than I felt on the evening of Sir George Dashwood's ball. Since the eventful day of the election, I had never seen Miss Dashwood; therefore, as to what precise position I might occupy in her favour, was a matter of great doubt in my mind, and great import to my happiness. That I myself loved her, was a matter of which all the badinage of my friends regarding her made me painfully conscious; but that, in our relative positions, such an attachment was all but hopeless, I could not disguise from myself. What then is to be done? thought I. If my own feelings be all that I have to depend upon to extort a reciprocal affection, then shall I take my last look of her, and with it the first and brightest dream of happiness my life has hitherto presented.

It need not be wondered at if the brilliant *coup d'œil* of the ball-room, as I entered, struck me with astonishment, accustomed as I had been hitherto to nothing more magnificent than an evening party of squires and their squiresses, or to the annual garrison ball at the barracks. The glare of wax-lights, the well-furnished saloons, the glitter of uniforms, and the blaze of jewelled and satin dresses, with the clang of military music, was a species of enchanted atmosphere which, breathing for the first time, rarely fails to intoxicate.

As yet I had neither seen Sir George nor his daughter, and, while I looked on every side for Lucy Dashwood, it was with a beating and anxious heart I longed to see how she would bear comparison with the blaze of beauty around.

Just at this moment a very gorgeously-dressed hussar stepped from a door-way beside me, as if to make a passage for some one, and the next moment she appeared, leaning upon the arm of another lady. One look was all that I had time for, when she recognised me.

'Ah, Mr O'Malley—how happy—has Sir George—has my father seen you?'

'I have only arrived this moment; I trust he is quite well.'

'Oh, yes, thank you' ——

'I beg your pardon with all humility, Miss Dashwood,' said the hussar, in a tone of the most knightly courtesy, 'but they are waiting for us.'

'But, Captain Fortescue, you must excuse me one moment more. Mr Lechmere, will you do me the kindness to find out Sir George? Mr O'Malley—Mr Lechmere.'

The gentleman to whose guidance I was intrusted, was one of the aid-de-camps, and was not long in finding Sir George. No sooner had the good old general heard my name, than he held out both his hands, and shook mine most heartily.

'At last, O'Malley, at last I am able to thank you for the greatest service ever man rendered me. He saved Lucy, my lord; rescued her under circumstances where any thing short of his courage and determination must have cost her her life.'

'Ah! very pretty, indeed,' said a stiff old gentleman addressed, as he bowed a most superbly-powdered coxcomb before me; 'most happy to make your acquaintance.'

'Who is he?' added he, in nearly as loud a tone to Sir George.

'Mr O'Malley, of O'Malley Castle.'

'True, I forgot; why is he not in uniform?'

'Because, unfortunately, my lord, we don't own him; he's not in the army.'

'Ha! ha! thought he was.'

'You dance, O'Malley, I suppose. I'm sure you'd rather be over there than hearing all my protestations of gratitude, sincere and heartfelt as they really are. Lechmere, introduce my friend Mr O'Malley: get him a partner.'

I had not followed my new acquaintance many steps, when Power came up to me. 'I say, Charlie,' cried he, 'I have been tormented to death by half the ladies in the room, to present you to them, and have been in quest of you this half hour. Your brilliant exploit in savage land has made you a regular *preux chevalier*; and if you don't trade on that adventure to your most lasting profit, you deserve to be—a lawyer. Come along here; Lady Muckleman, the adjutant-general's lady, has four Scotch daughters you are to dance with; then I am to introduce you in all form to the dean of some thing's niece; she is a good-looking girl, and has two livings in a safe county. Then there's the town-major's wife, and, in fact, I have several engagements from this to supper time.'

'A thousand thanks for all your kindness in prospective, but I think, perhaps, it were right I should ask Miss Dashwood to dance, if only as matter of form—you understand.'

'And if Miss Dashwood should say, "With pleasure, sir," only as matter of form—you understand,' said a silvery voice behind me. I turned, and saw Lucy Dashwood, who, having overheard my very free and easy suggestion, replied to me in this manner.

I here blundered out my excuses. What I said, and what I did not say, I cannot now remember; but certainly it was her turn now to blush, and her arm trembled within mine as I led her to the top of the room. In the little opportunity which our quadrille presented for conversation, I could not help remarking that, after the surprise of her first meeting with me, Miss Dashwood's manner became gradually more and more reserved, and that there was an evident struggle between her wish to appear grateful for what had occurred, with a sense of the necessity of not incurring a greater degree of intimacy. Such was my impression, at least, and such the conclusion I drew from a certain quiet tone in her manner, that went farther to wound my feelings, and mar my happiness, than any other line of conduct towards me could possibly have effected.

Our quadrille over, I was about to conduct her to a seat, when Sir George came hurriedly up, his face greatly flushed, and betraying every semblance of high excitement.

'Dear papa, has any thing occurred? pray, what is it?' inquired she.

He smiled faintly, and replied, 'Nothing very serious, my dear, that I should alarm you in this way; but certainly a most disagreeable *contre temps* could scarcely occur.'

'Do tell me—what can it be?'

'Read this,' said he, presenting a very dirty-looking note.

Miss Dashwood unfolded the billet, and, after a moment's silence, instead of participating, as he expected, in her father's feeling of distress, burst out a-laughing, while she said, 'Why, really, papa, I do not see why this should put you out much, after all. Aunt may be somewhat of a character, as her note evinces, but after a few days' ——

'Nonsense, child; there's nothing in this world I have such a dread of as that confounded woman—and to come at such a time.'

'When does she speak of paying her visit?'

'I knew you had not read the note,' said Sir George, hastily; 'she's coming here to-night, is on her way this instant, perhaps. What is to be done? If she forces her way in here, I shall go deranged outright. O'Malley, my boy, read this note; and you will not feel surprised if I appear in the humour you see me.'

I took the billet from the hand of Miss Dashwood, and read as follows:—

'DEAR BROTHER,—When this reaches your hand, I'll not be far off—I'm on my way up to town, to be under Dr Dease for the ould complaint. Cowley mistakes my case entirely; he says it's nothing but religion and wind. Father Magrath, who understands a good deal about females, thinks otherwise—but God knows who's right. Expect me to tea, and, with love to Lucy, believe me yours, in haste,

JUDITH MACAN.

'Let the sheets be well aired in my room; and, if you have a spare bed, perhaps we could prevail upon Father Magrath to stop too.'

I scarcely could contain my laughter till I got to the end of this very free and easy epistle; when at last I burst forth in a hearty fit, in which I was joined by Miss Dashwood.

From the account Power had given me in the morning, I had no difficulty in guessing that the writer was the maiden sister of the late Lady Dashwood, and for whose relationship Sir George had ever testified the greatest dread, even at the distance of two hundred miles; and for whom, in any nearer intimacy, he was in nowise prepared.

'I say, Lucy,' said he, 'there's only one thing to be done; if this horrid woman does arrive, let her be shown to her room, and for the few days of her stay in town, we'll neither see nor be seen by any one.'

Without waiting for a reply, Sir George was turning away to give the necessary directions, when the door of the drawing-room was flung open, and the servant announced, in his loudest voice, 'Miss Macan.' Never shall I forget the poor general's look of horror as the words reached him; for, as yet, he was too far to catch even a glimpse of its fair owner. As for me, I was already so much interested in seeing what she was like, that I made my way through the crowd towards the door. It is no common occurrence that can distract the various occupations of a crowded ball-room, where, amid the crash of music and the din of conversation, goes on the soft low voice of insinuating flattery, or the light flirtation of a first acquaintance; every clique, every coterie, every little group of three or four, has its own separate and private interests, forming a little world of its own, and caring and heeding nothing that goes on around; and even when some striking character or illustrious personage makes his *entrée*, the attention he attracts is so momentary, that the buzz of conversation is scarcely, if at all, interrupted, and the business of pleasure continues to flow on. Not so now, however. No sooner had the servant pronounced the magical name of Miss Macan, than all seemed to stand still. The spell thus exercised over the luckless general, seemed to have extended to his company, for it was with difficulty that any one could continue his train of conversation, while every eye was directed towards the door. About two steps in advance of the servant, who still stood door in hand, was a tall elderly lady, dressed in an antique brocade silk, with enormous flowers gaudily embroidered upon it. Her hair was powdered, and turned back, in the fashion of fifty years before; while her high pointed and heeled shoes completed a costume that had not been seen for nearly a century. Her short skinny arms were bare, and partly covered by a falling flower of old point lace, while on her hands she wore black silk mittens; a pair of green spectacles scarcely dimmed the lustre of a most peering pair of eyes, to whose effect a very palpable touch of rouge certainly added brilliancy. There stood this most singular apparition, holding before her a fan about the size of a modern tea-tray, while at each repetition of her name by the servant, she curtsied deeply, returning the while upon the gay crowd before her a very curious look of maidenly modesty at her solitary and unprotected position.

As no one had ever heard of the fair Judith, save one or two of Sir George's most intimate friends, the greater part of the company were disposed to regard Miss Macan as some one who had mistaken the character of the invitation, and had come in a fancy dress. But this delusion was but momentary, as Sir George, armed with the courage of despair, forced his way through the crowd, and taking her hand affectionately, bid her welcome to Dublin. The fair Judy, at this threw her arms about his neck, and saluted him with a hearty smack, that was heard all over the room.

'Where's Lucy, brother? let me embrace my little darling,' said the lady, in an accent that told more of Miss Macan than a three-volume biography could have done; 'there she is, I'm sure; kiss me, my honey.'

This office Miss Dashwood performed with an effort at courtesy really admirable, while, taking her aunt's arm, she led her to a sofa.

It needed all the poor general's tact to get over the sensation of this most ill-timed addition to his party; but by degrees the various groups renewed their occupations, although many a smile, and more than one sarcastic glance at the sofa, betrayed that the maiden aunt had not escaped criticism.

Power, whose propensity for fun very considerably outstripped his sense of decorum to his commanding officer, had already made his way towards Miss Dashwood, and succeeded in obtaining a formal introduction to Miss Macan.

'I hope you will do me the favour to dance next set with me, Miss Macan?'

'Really, captain, it's very polite of you; but you must excuse me, I was never any thing great in quadrilles; but if a reel or a jig' ——

'Oh, dear aunt, don't think of it, I beg of you.'

'Or even Sir Roger de Coverley,' resumed Miss Macan.

'I assure you, quite equally impossible.'

'Then I'm certain you waltz,' said Power.

'What do you take me for, young man? I hope I know better; I wish Father Magrath heard you ask me that question, and for all your lace jacket' ——

'Dearest aunt, Captain Power didn't mean to offend you; I'm certain he' ——

'Well, why did he dare to—(*sob, sob*)—did he see any thing light about me, that he—(*sob, sob, sob*)—oh dear! oh dear! is it for this I came up from my little peaceful place in the west?—(*sob, sob, sob*)—general, George, dear; Lucy, my love, I'm taken bad. Oh dear, oh dear!—is there any whisky negus?'

Whatever sympathy Miss Macan's sufferings might have excited in the crowd about her before, this last question totally routed them, and a most hearty fit of laughter broke forth from more than one of the by-standers.

At length, however, she was comforted, and her pacification completely effected by Sir George[illegible] to a whist-table. From this moment[illegible] for above two hours. Meanwhile I [illegible] of following up my intimacy with Miss [illegible] I rather suspected that, on more than [illegible] seemed to avoid our meeting, I took [illegible] part, to spare her the annoyance.

For one instant only had I an opportunity of observing her, and then there was such an [illegible] ment in her manner, that I readily [illegible] felt circumstanced, and that the sense [illegible] whose farther advances she might have feared, rendered her constrained and awkward. Too true, sad [illegible] avoids me; my being here is only a source of [illegible] and pain to her; therefore I'll take my leave, and resolve whatever it may cost me, never to return. With this intention, resolving to wish Sir George [illegible] sought him out for some minutes. At length I saw him in a corner, conversing with the old nobleman to whom he had presented me early in the evening.

'True, upon my honour, Sir George,' said he; 'I saw it myself, and she did it just as dexterously as the oldest blackleg in Paris.'

'Why, you don't mean to say that she cheated?'

'Yes, but I do though—turned the ace every time. Lady Herbert said to me, "Very extraordinary it is—four by honours again." So I looked, and then I perceived it—a very old trick it is; but she did it beautifully. What's her name?'

'Some western name; I forget it,' said the poor general, ready to die with shame.

'Clever old woman, very,' said the old lord, taking a pinch of snuff; 'but revokes too often.'

Supper was announced at this critical moment, and before I had farther thought of my determination to escape, I felt myself hurried along in the crowd towards the staircase. The party immediately in front of me were Power and Miss Macan, who now appeared reconciled, and certainly testified most openly their mutual feelings of good-will.

'I say, Charley,' whispered Power, as I came along, 'it is capital fun—never met any thing equal to her; but the poor general will never live through it, and I'm certain of ten days' arrest for this night's proceeding.'

'Any news of Webber?' I inquired.

'Oh yes, I fancy I can tell something of him; for I heard of some one presenting himself, and being refused the *entrée*, so that Master Frank has lost his money. Sit near us, I pray you, at supper; we must take care of the dear aunt for the niece's sake—eh?'

Not seeing the force of this reasoning, I soon separated myself from them, and secured a corner at a side-table. Every supper on such an occasion as this, is the same scene of soiled white muslin, faded flowers, flushed faces, torn gloves, blushes, blanc-mange, cold chicken, jelly, sponge cakes, spooney young gentlemen doing the attentive, and watchful mammas calculating what precise degree of propinquity in the crush is safe or seasonable for their daughters, to the moustached and unmarrying lovers beside them. There are always the same set of gratified elders, like the benchers in King's Inns, marched up to the head of the table, to eat, drink, and be happy—removed from the more profane looks and soft speeches of the younger part of the creation. Then there are the '*oi polloi*' of outcasts, younger sons of younger brothers, tutors, governesses, portionless cousins, and curates, all formed in a phalanx round the side-tables, whose primitive habits and simple tastes are evinced by their all eating off the same plate and drinking from nearly the same wine-glass—too happy if some better-off acquaintance at the long table invites them to 'wine,' though the ceremony on their part is limited to the pantomime of drinking. To this miserable *tiers état* I belonged, and bore my fate with unconcern; for, alas! my spirits were depressed, and my heart heavy. Lucy's treatment of me was every moment before me, contrasted with her gay and courteous demeanour to all, save myself; and I longed for the moment to get away.

Never had I seen her looking so beautiful: her brilliant eyes were lit with pleasure, and her smile was enchantment itself. What would I not have given for one moment's explanation, as I took my leave for ever!—one brief avowal of my love, my unalterable devoted love; for which I sought not nor expected return, but merely asked that I might not be forgotten.

Such were my thoughts, when a dialogue quite near me aroused me from my reverie. I was not long in detecting the speakers, who, with their backs turned to us, were seated at the great table, discussing a very liberal allowance of pigeon-pie, a flask of champagne standing between them.

'Don't now! I'd have you to remember it ain't a Widow Malone you have beside you.'

'Never heard of the lady,' said Power.

'Sure it's a song—poor creature—it's a song they made about her in the North Cork, when they were quartered down in our country.'

'I wish you'd sing it.'

'Well, mind you get up a good chorus, for the song has one, and here it is.'

'Miss Macan's song!' said Power, tapping the table with his knife. 'Miss Macan's song!' was re-echoed on all sides; and before the luckless general could interfere, she had begun. How to explain the air I know not, for I never heard its name; but at the end of each verse, a species of echo followed the last word, that rendered it irresistibly ridiculous.

Did you hear of the Widow Malone,
Ohone!
Who lives in the town of Athlone
Alone!
Oh! she melted the hearts
Of the swains in them parts,
So lovely the Widow Malone,
Ohone!
So lonely the Widow Malone.

[illegible] his fair g[illegible] most co[illegible] city of [illegible] escape cold, [illegible] a promise [illegible]

Notwithstanding [illegible] tention of the lady. [illegible] carriage, and only [illegible] collected around the [illegible] lating some capital [illegible] he dreamed she was.

'Doubt it who will,' said he, 'I [illegible] call on her to-morrow—written [illegible] See here.' At these words he pulled [illegible] handed it to Lechmere. [illegible] other thrown upon the writing-[illegible] isn't it, Power?'

'To be sure it is, man,' said Power, 'devilish seedy; but that's the quarter.'

'Why, man,' said the other, 'there's not a coat of that here.'

'Read it out,' said Power; 'proclaim aloud my [illegible]'

Thus urged, Lechmere read:—

'Dear P.—Please pay to my credit, and [illegible] the two ponies lost this evening. I have [illegible] the pleasure of enjoying your ball, kissed the lady [illegible] the papa, and walked into the cunning Fred. [illegible]

Yours, FRANK W[illegible]

The Widow Malone, ohone, is at your service.'

Had a thunderbolt fallen at his feet, astonishment could not have equalled the result of this revelation. He stamped, swore, raved, laughed, and almost went deranged. The joke was soon spread through the room, and from Sir George to poor Lucy, now covered with blushes at her part in the transaction, all was laughter and astonishment.

'Who is he? that is the question,' said Sir George, who, with all the ridicule of the affair hanging over him, felt no common relief at the discovery of the imposition.

'A friend of O'Malley's,' said Power, delighted, in his defeat, to involve another with himself.

'Indeed!' said the general, regarding me with a look of very mingled cast.

'Quite true sir,' said I, replying to the accusation that his manner implied; 'but equally so, that I neither knew of his plot, nor recognised him when here.'

'I am perfectly sure of it, my boy,' said the general; 'and, after all, it was an excellent joke, carried a little far it's true—eh, Lucy?'"

NARRATIVE OF THE PERILOUS VOYAGE OF THE "AVON" FROM DUBLIN TO LIVERPOOL.

BY A PASSENGER.

On Sunday evening, 6th January 1839, I started for Liverpool in H.M. mail packet "Avon" (Captain Townley) from Kingstown pier. There were sixteen passengers besides myself on board (twelve gentlemen and four ladies), also a little daughter of Madame Dulcken [a musician who had been performing publicly in Dublin]. When we had cleared the Dublin Lights, the evening set in rough, with an uneasy swell; but the sky was still serene, some heavy masses of black clouds, edged with copper, lying to the southward.

Being used to rough nights at sea, I did not anticipate any thing unusual, but retired tranquilly to bed at ten o'clock. My berth was so situated in the state cabin as to enable me to see every person in it, and what was going forward there. Several of the gentlemen remained at the cabin table long after I retired, some talking politics, some drinking brandy and water, and others playing backgammon. I had been asleep about two hours, when my head was dashed suddenly against the side of my berth, which awoke me in alarm. Upon looking out, I was surprised to see all my fellow-passengers standing in the cabin, partly undressed, and in great consternation. Some had left their berths in terror, and those who were lying upon sofas had been pitched off about the cabin floor. The hurricane had begun in reality, and with such sudden violence as nearly to deprive us of expression.

Digitized by Google

The vessel was now rolling and pitching at a very furious rate, but we only gazed at each other in silence, with pale faces, in which fear was strongly depicted. Three hours more wore on, during which the hurricane had been momentarily increasing, so that at about four o'clock on the following (Monday) morning, the storm was raging at its highest pitch of fury.

I did not get up with the rest, but lay still in my berth, looking out upon my frightened fellow-passengers, and listening fearfully to the wild roaring of the elements. At times, the mad whistling of the winds through the masts and rigging was like the unearthly shrieking of demons in the air; these dreadful sounds appalled me more than the constant pitching of the vessel and creaking of her timbers. About five o'clock this morning, we were aroused from our stupor of fear by a loud crash; it was one of the masts which had given way, and fallen upon the poop. A deathlike silence ensued, and the vessel began to labour in the trough of the sea, as if tired out by straining and unnatural exertion. Before the "dreadful morrow" broke, the men who were lashed to the helm cried out, "Captain overboard!" This news was indeed a severe blow to us, as we were depending entirely on the captain's skill to save us. Hope was for a while completely extinguished. This, however, proved to be a false report: the captain was *not* swept overboard; he was only carried off the quarter-deck by a dreadful sea, and pitched forward amongst the anchor chains, where he lay for a while insensible, until one of the seamen stumbled over him. They wanted to carry him to his cabin, but the brave little commander would not allow it; and, although much injured, he insisted upon a rope being fastened across the quarter-deck, in the middle of which was a noose, that (whilst it held him securely) allowed him to move about the deck.

I had so much confidence in our captain's experience, as to feel assured he would be able to make his way gallantly if the darkness of night were once past. Filled with this hope, I got out of my berth, and waited anxiously for daylight; with great difficulty I made my way to the top of the cabin stairs, where I stood a while looking out upon the most awfully grand sight my eyes ever beheld. The fury of the winds had slightly abated, but the agitation of the sea had increased to a fearful height. At the moment I looked out, the vessel had just descended the sloping side of a mountain wave, and was labouring darkly in the trough of the sea; two enormous walls of green transparent water reared themselves far, far above the vessel!

——— "the mountain wave
Recumbent, with its weight of bursting waters!"

I rushed down to the cabin again, under the impression that these immense masses of water would inevitably fall in upon us, and strike her to the bottom! But I was wrong, for the next minute she emerged from that fearful gulf, and was ascending another mountain of water, only to be again plunged into a similar abyss.

The hope I encouraged during the night began to vanish; the long and anxiously wished-for daylight was there indeed, but the sea-drift prevented the crew from seeing five yards beyond the vessel. Night or day were now all the same to us, for she became completely unmanageable. The men at the wheel declared their labours to be useless, as she continued drifting rapidly (in despite of all their efforts) towards those shelving sands on the Welsh coast where the "Rothesay Castle" was lost.

This melancholy day, up to five o'clock in the afternoon, was spent in vainly endeavouring to turn her head out to open sea, from the certain destruction towards which she was rapidly drifting. As the cabin door had been made fast early in the day by the captain's orders, and no passenger allowed on deck, we were informed through the broken poop that the captain had determined upon making a final experiment in order to effect what he had been all day trying at in vain. This "dernier resort" was to put on all her canvass, place four men at the helm, and force her head round out to open sea. Such a proceeding in such a gale, we were told, might be fatal, and were desired to be prepared for the worst consequences.

The uproar upon deck was now heard above the storm; the hoarse voice of the captain's speaking-trumpet was answered by shrill whistles and loud "ay, ay's," when suddenly we spun round with a report like a volley of musketry. It was the noise of the mainsail, which was blown into pieces! The success of this skilful manœuvre gave us a little hope; we were now at open sea again, but without coal, and, consequently, without steam, and our captain confessed himself to be ignorant of his exact situation. The second night now came on, more terrible than night ever appeared to me before.

About seven o'clock, a dreadful sea struck our bows, which made us recoil a great distance, and settle heavily in the trough of the sea. The general feeling was that she had struck, and was filling fast. Mr Lucas exclaimed loudly, "We are gone at last! Lord, receive our souls." A wild rush of the terror-stricken ladies into our cabin from their own, disturbed our devotions; the prospect of death banished all nice distinctions, for they clung frantically to whoever they could grasp, and cried aloud to those undressed and miserable "lords of the creation" to save them.

As I was the only passenger that remained in berth at this period, I looked out upon the unhappy group as *real* actors in a *real* tragedy. Poor Madame Dulcken, in attempting to reach her husband, was precipitated head foremost against the rail of my berth; she fell backwards on the cabin floor, and lay there senseless and unassisted. Her husband (Monsieur Dulcken), sat near the spot where she fell, with his little daughter crouching in his lap; but so powerless was this poor German that he did not move; he sat shivering in his scanty dress, and looking unutterable anguish.

Things were in this state when the cabin door was hammered open, and in rolled three drenched and black-looking engine-men. The foremost laid down his lantern, and after wringing the sea water out of his woollen cap, he raised a circular piece out of the cabin floor, and handed up some reserve lumps of resin and coal to his companion. Some of the passengers addressed these men, and begged to know if there was any hope, but their answers were brutal and reckless.

One of the gentlemen (Captain O'Grady) had a favourite mare on deck; I heard him often during this day regret his inability to go out and give her some assistance; but now that the cabin door was opened, he seized a large case-bottle of brandy, and made his way to her crib. When he reached her, she was little better than alive; the bulwarks, which formed part of her shelter, had been all carried away, consequently, every sea washed over the prostrate and stiffened form of poor Bess. This fine-hearted young fellow knelt down beside his favourite, and rubbed her with the brandy, and poured some down her throat, until he restored animation: during this operation, the sea was washing over both horse and master. In some time after, he returned to the cabin quite drenched, but seemingly much happier. I am glad to say that the mare lived.

When these savage engine-men left the cabin, we were again fastened down, and left to bitter reflection. We really felt the sickness of heart which is caused by "hope deferred;" despair was in every countenance. The strong and proud men I saw so happy at the cabin table only the night before, were now weeping and praying audibly, and pressing their foreheads in an agony of grief.

I lay still in my berth, and felt that *my hour was surely come*. During thirty hours I had not even tasted water. I felt exhausted, and longed to wet my lips; but I saw it was useless to ask for any thing, as the steward lay upon his face on the floor, in a state of stupefaction.

I tried to collect my thoughts, and prayed in simple yet fervent terms to God, to avert the death which momentarily threatened me, and to prolong my life for the sake of my wife and child.

After this I felt more calm and resigned to my fate, and scenes and incidents in my life, from my boyhood to the present, rose vividly to my mind. I wondered whether my body would be washed ashore or not; and if so, whether kind hands would bury me. Extreme exhaustion was succeeded by a slight delirium. I fancied that F—— was there dressed in mourning, holding our baby with a tiny black bough in her cap, and both so near me in the berth, that I often stretched forth my hand to touch them. After lying some time in this state, I sank into insensibility. It is said, when things come to the worst point, they change; for, on the next (Tuesday) morning, we were aroused by the voice of the captain, who had burst in the cabin-door, and shouted out, "Thank God! I have you anchored in Beaumauris at last!" This was like an electric spark to us. We started, but could not speak. "Three cheers for our brave little captain," cried O'Grady. The attempt to do so was made, but such a faint sound issued from our parched lips, that it could be only called the *ghost* of a cheer.

When I had recovered sufficiently to remark the objects around me, I was struck with the appearance of our captain. His face (after the last forty hours' exposure to the hurricane) was a mixture of colours, in which red and blue were predominant, and his eyes bloodshot. He was encased in oiled linen, with a "sou-wester" tied firmly under his chin. Yet he appeared to me more lovely than Adonis; I grasped his hand, and thanked him from my heart. About ten o'clock on Tuesday morning (8th January), I came upon deck, having at last left the berth I thought I should have died in.

Madame Dulcken was already there before me, inspecting the amount of injury done by the sea to her splendid piano. Captain O'Grady was also on deck, looking after the recovery of his mare. This gentleman had also two beautiful small dogs on board; they were coupled with a small chain, and placed in the "cabouse" for warmth; notwithstanding this precaution, the sea had reached them, and the smaller one perished. I was much struck with the mute sorrow of the surviving dog, as he sat shivering and looking down upon his dead companion.

Before leaving the vessel, I sat down and wrote an address to Captain Townley, which, having been unanimously approved of, I had the pleasure of reading and presenting to him. We then made a collection for the crew, and came ashore in small boats at Bangor, after having endured, and (through the mercy of Divine Providence) escaped, the most awful hurricane ever remembered.

[The vessel afterwards proceeded to Liverpool, where it arrived safely, but after a passage of extreme difficulty and danger.]

A SUMMER IN BRITTANY.*

A NEW work in two volumes, entitled a "Summer in Brittany," and the production of T. A. Trollope, Esq., B. A., presents us with much pleasant and amusing reading. Brittany, or Bretagne, is a portion of France that has been little visited, comparatively speaking, by travellers, and this remark applies particularly to the interior of the province. The Breton district forms the northern boundary of the Bay of Biscay, and comprises the five modern departments of Ille et Vilaine, Loire Inferieure, Côtes du Nord, Morbihan, and Finistere.

Brittany was formerly known by the name of Armorique or Armorica, and, at a later period, constituted an independent principality under its present designation. The Bretons, and more especially those called the Low-Bretons, occupying Finistere and Morbihan, are a race of pure Celts, and have preserved numberless peculiarities, indicative of their origin, and distinguishing them from their neighbours of Normandy. They retain their old language, one perfectly different from any of the provincial French dialects, and are, in dress and habits, strikingly and obstinately primitive, resembling very much, in these respects, the Welsh, with whom, both in name and descent, they have an unquestionable affinity. Instead of the tall persons, oval features, and blue eyes of the Norman race, the Bretons are marked by black eyes, short stature, and rounded faces, with strongly formed jawbones. They wear calf-skin or sheep-skin coats, with the hair or wool outside, and large loose breeches, tied at the knee, and leaving the stocking visible below. In their habits they are generally very filthy, and their houses are so much characterised by the same features, that one may readily break a leg in the mudholes of the floors, as we are told by a French writer, quoted in the volumes before us. In their agricultural practices, and in short in every imaginable point, the Breton peasants adhere to the imperfect civilisation left to them by their ancestors.

"I spoke in a former chapter (says our author), of the Low-Breton tailor as being a personage of much importance in the social life of the peasants. He it is who conducts the delicate negotiations which precede a marriage. When a young peasant has fixed his affections upon a girl, he seeks the tailor, and confides his passion to him. This plenipotentiary then proceeds to the lady's dwelling, and hangs about till he can find an opportunity of talking with her alone. Having found this, he commences the conversation with some rustic commonplace topics, but soon adroitly turns it to the object of his embassy. His business is then to represent his employer as the most eligible 'parti' in the commune, and ply her with all the arguments and eloquence which his long experience has taught him are most powerful in such cases.

If this negotiation is successful, the matter is then laid before the parents of either party; and if no opposition is made by them to the projected match, a day is appointed for a meeting.

On the day fixed, the tailor, with a white rod in his hand, and grotesquely clad with one red stocking, and one purple one, brings the young man with his father, or some other relative, to the house of his mistress. There, while the old folks talk over the matter, the young people retire to the farther part of the house, and enjoy a long and uninterrupted conversation. This tête-à-tête is considered inviolable. No one will venture to interrupt the lovers. And, when at length they themselves bring their billing and cooing to an end, they return to the table hand in hand. Some white bread, wine, and brandy, are then produced, and the affianced pair eat with the same knife, and drink from the same glass.

Before they part, another day of meeting, also at the bride's house, is appointed. This is termed 'velladen,' or the view. Upon the occasion all parties appear in their holiday dresses; and great attention is paid to arrange every thing in the house, and about the farm, to the best advantage. Every sort of device is resorted to, to give an air of opulence to the family; and many of the various articles carefully disposed so as to be seen by the visiters, are borrowed for the occasion. When the bridegroom's party arrives, a great deal of bargaining takes place, and the conditions of the marriage contract are then fixed. When this is done, the fathers strike their hands in token that it is a bargain, and a day is appointed for the marriage.

A week before the day, each separately goes round and invites all his friends to the wedding feast. The invitation is generally in verse, and is delivered by the

* London: Henry Colburn. 1840.

Digitized by Google

inviter at the door of the houses of those who are invited.

When at length the day of the marriage has arrived, the strangest ceremony of all takes place. The tailor's services are now again put in requisition. Early in the morning, the bridegroom, with his relations and *his* tailor, present themselves before the door of the bride's house, on the threshold of which, her friends and *her* tailor are assembled to receive them. Then ensues a long dialogue in verse between the two tailors. The gentleman's spokesman represents his party as travellers who ask for hospitality. The poet retained on the lady's side replies that the roads are full of vagabonds, that he has nothing to say to them, and that they had better pursue their way. A good deal of bantering then succeeds. At last the man's tailor declares the real object for which he has come, and sets forth the good qualities of his employer—how he can plough as much in a day as three hired labourers, how he can alone replace a cart which has been overturned. He recounts his triumphs at wrestling matches, and adds, that in his hand the 'penbas' is more powerful than a sword in that of a soldier.

The other champion retorts by enumerating the perfections of the lady. She is light and supple as the blossom-covered branches of the broom, and when the dance begins, she, timid virgin as she is, holds in one hand the hand of her mother, and in the other that of a female friend. But this paragon, he concludes, is not here; she has long since left her father's house.

'You deceive me,' replies the other. 'The yew-tree is made for the churchyard, the rose for the garden, and young girls to grace the home of a husband. Do not throw us into despair! Lead hither by the hand her whom we desire, and we will place her at the wedding-feast near her bridegroom, under the eyes of her friends.'

'It seems we must yield to you, friend, you are so pressing,' says the lady's poet. He then goes into the house, and, returning with an old woman, says, 'Is this, then, the rose you are seeking?'

'From the venerable appearance of this woman,' replies the other, 'I judge that she has well fulfilled her task in this world, and that she has conferred happiness on him who has loved her. But she has ended that which the other must now begin. She is not the woman I seek.'

The other returns again to the house, and leads forth a young married woman, saying, 'Here is a young girl, beautiful as the morning star. Her cheeks are like roses; and her eyes are of crystal. One glance from them can render a heart sick for ever! This must be the fair one you want.'

'Certainly this soft cheek, and youthful freshness, look like those of a maiden. But this finger, bearing the marks of rubbing—has it not often been rubbed with pap for an infant to suck?'

'Nothing escapes your notice! Tell me, then, at once, is this she whom you want?'—bringing out a little girl of ten years old.

'That is exactly what she whom I seek was eight years ago. Some day this pretty child will make the happiness of a husband. But she must remain yet a long while on the *espalier*. The one I want waits but the gardener's basket to carry her to the table of the nuptial feast.'

The bride's spokesman then yields. He leads her from the house, saying, 'It is enough. You deserve her whom you ask for.'

The two families then enter the house together, and the tailor says, 'Behold the girl you have chosen! Your hands, children! Man! you have now a wife to defend and to make happy. Let us not ever see her weeping at the door of thy house, like a stranger; for God avenges the weak who weep.'

Then a prayer is said. All present are invited to the wedding; and the man's poet says, 'Come, maiden! bend your knees, and bow your head beneath the hands of your father, which bless you. You are weeping! Look at your father and your poor mother! They are weeping too; but how much more bitter are their tears than yours. They are about to be separated from a daughter whom they have cradled, and danced in their arms! Whose heart would not melt at the sight of such grief! Yet these tears must cease! Tender father, see there your child. Look upon her. Her arms are stretched out towards you! Poor mother, put your hands upon her! A prayer and a blessing for the child who is about to leave you! Enough, now! You have obeyed the commandments of God. Rise, maiden! embrace your parents, and arise in strength, for henceforward you belong to a man.'

After the service of the church, to which they then repair, they return immediately to the feast. This is in some cases provided at the house of the bridegroom, but more ordinarily at some 'auberge' in the neighbourhood. If the former is the case, every guest brings some present to the new-married couple. If the latter, every one pays his own share of the feast."

Being thenceforth banished from all festivals and *pardons* (something like the Irish patrons), the Breton bride considers her change of life as a matter for sorrow, not for joy, and so it assuredly is in many respects. She accordingly sings on the occasion a song of lamentation, and the following is the customary form:—

"In other days—in the days of my youth—how warm a heart I had! Adieu, my companions, adieu for ever!

I had a heart so ardent! Neither for gold, nor for silver, would I have given my poor heart! Adieu, my companions, adieu for ever!

Alas! I have given it for nothing! Alas! I have placed it where joys and pleasures are no more. Adieu, my companions, adieu for ever!

Go, maidens! run to fairs and to pardons; but for me, I must do so no longer! Adieu, my companions, adieu for ever!

For me, see you not that I must remain here! Henceforward I am but a servant, girls; for I am married. Adieu, my companions, adieu for ever!"

Our readers need scarcely be told, we believe, after these citations, that there is much pleasing matter in a "Summer in Brittany."

UNINVITED CONTRIBUTIONS.

In a late article entitled "Correspondents," we held forth a promise that we would take an early opportunity of presenting some specimens of the contributions which have from time to time been submitted to us for insertion in the Journal. This promise we are now about to redeem. One remark alone do we deem it necessary to make by way of preface, namely, that the importance of great failings in literature, as illustrations of the workings of the human mind, is perhaps greater than might be at first supposed. The effusions of a powerful or a brilliant, and at the same time well-disciplined intellect, have their well recognised value, for they go directly to the effect of either pleasing or improving. We are less apt to see that the effusions of the weak and undisciplined mind have also their value, as showing how such a mind works when it tries that for which neither natural nor acquired gifts have prepared it. With regard to the mere comic effect of these effusions, we say not a word, that being a point which we believe may be safely taken for granted.

We begin with prose—and, first, let us give a specimen of the class *essay*. It is entitled, "A short Essay on Good Temper;" and certainly if it has any merit whatever, it is that of brevity:—

"A good temper is a delightful thing, and is a faithful index to a generous heart; it hushes in its bosom every unkind prejudice, every malicious intent, and bears no rancour or feelings of animosity. To the weak failings of human nature, the misfortunes of the wretched, and the demolition of persecuted innocence, it turns a pitying eye. The stormy and turbulent passions of the soul are subdued by a placid and serene temper; and it has such advantages of cool reflection and self-determination, that it overcomes things seemingly unconquerable to the hasty and petulant. This happy unanimity of temper and feeling can work miracles on the human frame; sometimes it will soften the sterile heart to pity, and at other times it awakens the callous soul to a sense of its own corruption, and imbibes in the unfeeling and stoical a more just sense of unanimity and true friendship."

The following second specimen might be supposed to proceed from the same writer; but it does not, being in a different hand, and addressed from a different part of the kingdom. The subject is "Self-confidence." We look upon both papers as curiosities, but the second particularly, for not only is there in that instance an equal triteness, but the ideas are in a state of imperfection which no able mind could simulate:—

"There are two things, of which one or the other is generally more prominent in a young beginner. The first, a deficiency of conceit, or an indifference concerning confidence in one's self; the second, and much the worst of the two, an overwhelming conceit, or a degrading pride, which tends to unfit a person for any capacity where any resemblance of learning or meekness may be the object. The former may be defined in the following manner:—A young beginner may be naturally subject to this peculiar turn, which too frequently exposes him to ridicule, from an inward knowledge or sense of his comparative minuteness, carried to the effect of rendering him timid in his behaviour and expression, which may be worthy of the highest merit. The latter, more difficult to elucidate, on account of the many improprieties which attend it, hardly admits of being explained definitely; the following are a few of the many evils which invariably accompany it:—ambitious of empty eulogiums, without the energetic powers necessary to gain them real; a sham show of knowledge, easily detected by conversation; dress and gaudiness appear to be more attended to than that which tends to improve the mind; the person, by such ignorance, being totally blind to his mistakes, naturally shuns conversation; the last stage is then had resort to—he is solitary, and keeps perfect silence, forgetting the words of a valuable writer, 'Though silence is sometimes the mien of wisdom, it is yet too often the mask of ignorance.'"

In the department of fiction it is not so easy to present suitable specimens, for the articles of that nature are of such length that one or two would fill all the space we have to spare. A "beginning" or two must serve. And, first, let us submit the opening of a moral tale from Yorkshire:—

"It was on a beautiful evening in the summer of 1779, when, calmly and softly, nature was sinking to repose, and hallowing with her mellow light the rich harmony of the scene around them, that a young couple wended their way by the margin of a flowing and magnificent river, that, like a mirror, spread its glossy surface to the sky, reflecting therein a thousand variegated and sparkling hues. By the side of this placid stream, silently moving, but, like a mighty avalanche, to its fall, gay gardens, redolent in beauty, and full of sweetest odours, formed the rich framework in which the picture was encased. Of the two persons thus met, the one was a youth, of a carriage not positively noble, but yet dignified sufficiently to indicate an education and bearing above the ordinary walks of life—of a moderate stature, and of a pleasing countenance. The other, a fair-haired girl of eighteen, an age universally admitted to be the most productive of attractive qualifications, and not less so in the subject of whom we are at present speaking.

'And so, Walter,' she said, 'you are determined to be married, are you? Well, if you will, you must ——,'" &c.

A sentimental tale, dated from London, is less dulcet, but perhaps more amusing. It commences with a fine Sterne-like abruptness:—

"—— When I first knew her, she was scarce fifteen. You sometimes meet with female beauty that charms and captivates the eye, but how rare to find the mortal creature that does not know if nature has graced her above her fellows. But such was not our heroine (though heroine she was not); there was none of that masculine firmness which some would have their models of female excellence to possess; she was a child of nature—one that knew not the arts of some, or, I should say, most of our women. She said what she meant, and did what she said (what a rare quality among mankind!) Concerning her personal appearance, suffice it to say, it was all that God could give, or man desire; when she was of the age at which my story begins, she was watched over by one that was bound to her by the dearest natural tie the earth affords—a mother it was to whom she told all her little tales of pleasure or of care. How different with most of her age! Indeed, few friends she had save one who knew that

> There is many a gem of purest ray serene,
> The dark unfathomed caves of ocean bare,

That—

> Full many a flower is born to blush unseen,
> And waste its sweetness on desert air.

Often have I taken a stroll involuntarily towards their cottage, where I was sure to find *two at least* to welcome me, *and sometimes four, if the cat and dog were in the way;* but those happy hours will never come again, and it is no use lamenting what we cannot remedy—the mother of this cherished fair one did not live long after I knew them, and she that had been used to be fondled and caressed by the one to whom she clung, was left like the ivy that clings to the oak, and droops as soon as its only support is removed."

We receive great numbers of contributions in the epistolary form, generally presenting additional comments on subjects which have been discussed in the Journal. Some of these are in a style of earnestness quite edifying. One gentleman writes in such a strain of indignation respecting the expense of funerals, that, to be quite consistent, he must put his body into a codicil to his will, bequeathing it to the doctors. Another is not less emphatic on the subject of tight lacing. The latter gentleman, moreover, adds to the effect of his invectives by a mode of spelling apparently peculiar to himself, as a speaker sometimes gives character and force to his orations by a peculiar stutter or burr in his speech. We shall select one or two passages, preserving the original spelling, but adding points, and giving capital letters to the first words of sentences:—

"——The writer is avowedly against Tight lacing, and has his owen Reasons for being so disposed; first, that there is an absulate want of Self preservation in it, which in all ages has Constuted the first law of nature.

Secondly, that they are not in any way hesitating to alter or to amend the workmanship of Gods owen hands. It would not only be unfair of the writter to settil such a falt upon the femel Seek in general, but Truley Treacherous on the Male part, they are worthy of Bearing the wone half of the Blame. It has been long a vain and a folish part of young men, to flatter and hiley to appriciate the neatness and smallness of there Lovers, even in their owen ears, Converting there minds into Pride, rendering themselves more objects of petty than of real usefulness in any society of life, ether as Servents or as Mothers. If men in General would be so kind to themselves and others, as to alter there Tone of Flatterry to the Revers, it would have as powerfull an effect to bring the lacing Reform to the desired point, as any wone thing that I am to think off.

If the writter was as able, as what I am willing, to Publish a Lacing Reform, there is only wone point that I would Treat upon. I would Intreat Gentlemen of every description, and of every calling of life, to listen to the well Garrentend Statements frequentley given by Emenent Fesisions, Frequently given Regarding Tight lacing. Men and brethren, and fellow-Sitisens, the evil refered to has now gone its linth. What shall we do in order to prevent it? every Man amongst us, lett us teach Wone and all of us, that if we ar so blindfolded as to enter into any Contract of Matteromony, that we ought to be sure and take a house

Digitized by Google

near to a Seck nurss or Fesecion. Every attempt that man can make will be useless and vain to radicate the Prevaling evel, untill wonce the Femeals begin to learn that men of sence and humanity disaprove of the System of lacing to that extent. That they will not Involve themselves into a Fameley of Sekness and unfirmity, where a complaint is sett before the Industerous Husband almost every morning of a Shortness of Brath, a Pane of the side, a headack, or some other mallady Which she, the Spouse, have procured to hirself with her owen hands, throw the Meadiem of Tight Lacing during the former days of hir Courtship, which she is obliged to retain throw life as a Famely Peace, untill she is obliged to say that she is become sister to the Earth and to the Worm. Suffer me to exort you never grow weary in well dowing. If you Persevear, you will obtain. Never lett won man Dispare. While there is life, there is hope. Thow you did fale in the attempt, you could loss nothing, but show to an inlightened woreld your love and affection for mankind in General.

Sir, pirmit me to make a singel remark or Two upon Tight lacing. It is unbecoming in the church, as it has a tendency of keping up a Contenual Bussel of attendence with dor-kepers, lousing laces, some services of drinkes of watter, to the disscomotion of the whole house, or rather Church. It is now come to such a hight, that a fall is quite Expedent. Now active ie* can be deceived in it, where ever it is, as it has a Publick Tendency to show in there Countenances, that there is some that is disscomoding either there persons or mindes.

If learning and language would permitt me to make a Comparison regarding Tight lacing, I would then say that it is a pestelance wethin and wethout, which do Require much assistance to wash and Sweep, till every resemblence of it quite dissapear. It is now Drawing on to a peread of Three years Since the writter first began to agetate the quastin amongst my owen Cless of Society, and still wethout proper effect; I do Rejoice that much abler is begun to Sprade it to many Distant Isels. It will Doutless Reach every Sity, town, vilige, and hamelet in the kingdom of Great Britan. I think I hear the whole Inlightened Seck of femeals saying, 'we would be Glad to see a Reform of this kind, as we are growing weary of the old Punishing System of Tight Lacing, which we have Incured upon ourselves to Supporte Pride and to Procure Ruen to ourselves and our Succeding Generations; but we have never yet been able to procure a proper Plan to accomplish our desires. We most appear on the Streats and at Balls like others, and at the Theater Royel, or other wies we would become quite Comspecious. Will some now even Come to the Resaulution, and say we will now make up our minds, and resolve to Invent Some sort of a Dress in order to give Some Satisfactian to our associates, least we get out of there estimation altogether, and than we will have a worse Risk to runn. You know to a Sertenty, the Cace is quite deferent that what it was onley a feew years ago, when the Tighter that we wer Bound in our fetters of Steal, Bone, and cotton lace, that we wer the more admired,'" &c.

We have only room on the present occasion for one further specimen; but it is one well fitted for a conclusion, the narrative being, as the newspapers say, "curious, if true:"—

"Having lately read in the 368 number of your journal, an artical entitle absurdities, one of the maney enumerated was, 'Praiseing the beauty of a woman's hair before you know whether it did not belong to another person.' My occupation being that of a hair-dresser, I have frequent oppertunity of observing the reality of many absurdities too tedious to enumerate. * * About two years ago, a respectable Jewler in this city, got an order for a gold broach with a clasp, intended to contain a peace of hair, which at the same time was produced, with instructions to plait them neetly up, stateing that they ware cut out of the head of Sir W. Scott. They got them as a great favour from a very respectable person Intimately aquented, and Both known to Sir Walter when in life; therefor they ware ansious to preserve this Small remnent of his hair, the only Memorial of the Great Unknown She had in his posession. The Jewler in the mean time opened up the parsol to exeman the hair, when, to his astonishment, he beheld three soletarey hairs, one eighth of an Inch Long, perfectly useless for the purpose for which they ware intended. He thought he would apply to me, to see wither I could match the culour with a peace Long enough to plaite. I had nothing to sute at the time. White hair is allways a very scarce Culour, and rarely long enough to plait. I told him it would be some time before I could procure it for him. He waited with painfull anciety for 6 or 8 days, calling 2 or three times every day During that time. Fortunately a Gentleman, who has a Large newfoundland dog, came to be dressed every day at my shop. The dog is of a Black and white culour, with a Large Bushey tail, the white hair of which I thought would match that of Sir Walter Scott. I mentioned the circumstance to the gentleman, at the same time requesting permission to cut a Loke of hair from off his dog, which was imediatly granted: the cissers in a moment severed the fur from his tail, close to the Skine, and Level with his rump. In the meen time the person had calld at the Jewler to see if the Broach was complected, wheeh was answered in the Negitive. The person then left, promising to call another day. The Jewler came to aprise me of his visit, when I informed him of my success in procureing the hair, which gave great Satisfaction to the Customer, but more so to the Jewler, which will be afterwards proved. Not a month after, he received from two more Individules an order of the same kind as the above, and recomanded by his first employer; all which he undertook to perform, also provoiding the hair for them, knowing by this time whare it was to be found growing. The outrageous attacts of the Jewler Upon the old dog were soon noticed by the boys of the Nabourhood, by the grotsaque and Naked appearance given him by his Shorn tail, which afforded them ample Sport for many a day; but his haggerd appearance at last excited the simphies of the more humane, being Imployed in watching a Shop. He was removed by his master to a quiter retreet, there to spend the remainder of his days, in that ease and quiet comfort his Long and Valuable Services mirited, and is always the reward a faithfull Servent is entittled to receive, Sir Walter Scott (for that was the dog's name), paid the debt of nature about two years ago; the Jewler has also gone to his fathers."

* Apparently, no active eye.

NATURAL TERRACES ON THE EILDON HILLS.

A LATE paper, entitled "Changes of Level in the Earth's Surface," gave a brief view of certain natural terraces in various parts of the globe, particularly in South America and in Glenroy in Inverness-shire, which are now esteemed by geologists as the remains of ancient sea-beaches, which had been formed when the land was on a lower level than at present, and subsequently were raised into their present elevation by upheavals of the crust of the earth, such as have taken place on various occasions within the memory of man in Chili.

A recent paper on the Glenroy terraces, by Mr Darwin (published in the Philosophical Transactions), has had the effect, within the last twelve months, of calling the attention of a private individual, resident in the town of Galashiels in Selkirkshire, to certain appearances of the same kind on the hills around that town; and the result has been a series of observations and measurements, making it quite clear, as we apprehend, that here also we have a most interesting memorial of those changes which have fitted our country for becoming a habitable land. The observer in this case is Mr William Kemp, manager of the gas-works in Galashiels, a person, we believe, of limited education, but considerable natural penetration, and the leader of a local geological society. The writer of the present paper has, in company with Mr Kemp, gone over the whole ground, and satisfied himself that the appearances really are, as far as he can judge, of the same character with those of Glenroy, though in general less conspicuously marked.

The town of Galashiels stands on the bank of the Gala, at a point where the vale is broad and open, and within a mile of its junction with the vale of the Tweed. The site of the town resembles an irregular amphitheatre enclosed by hills, the continuity of which is broken in upon at two main points, where the Gala enters above from the north-west, and where the Tweed flows in below from the south or south-west. About two miles below the junction of the Gala and the Tweed, the treble-peaked Eildon seems to close up the scene on the east. The hills bounding the Galashiels vale on the northerly or right bank of the Gala, are Buckholm Hill and Appletree-leaves Hill; on the southern or left side, Galashiels Hill and Meigle Hill. The hollows between these heights are wide and deep, with streamlets flowing at the bottom. On the north and south sides of the Tweed, between the influx of the Gala and the Eildons, there are also several bordering hills. On the south are the Abbotsford Hills, with the Cauldshiels Loch behind them; and on the north is Housebyre Hill and others. All these are hills visible from each other, and lying within a space of five or six miles in diameter.

On the encircling sides of these hills (as well as on others to be pointed out), there are traceable distinct terraces or beach-marks, to the number of *fifteen*, rising one above another like the steps of a stair.* On no one of the hills are the whole fifteen distinctly visible in succession at any given point, but on various parts many of them are clearly discernible, existing in a regular series. All of these beach-marks run in a perfectly horizontal line, are parallel to one another, and agree in level with corresponding members of the series on the adjoining hills. The Eildons, as the most prominent eminences of the district, merit our first consideration in descending to particulars. The middle peak of the three, which is the most elevated, has been found to stand at the height of 1330 feet above the level of the sea, and the peak to the east or north-east stands but fifteen feet lower. The third hill is much lower, and retired from the view. Looking at the two first-mentioned heights from a little distance, lines or tracks are seen on each, agreeing perfectly in level, and so well marked, that, when the attention is once called to them, one cannot but wonder that they should never before have arrested notice. Fifteen feet below the apex of the eastern hill, a line appears, which, when examined close at hand, proves to be a fine grassy shelf or plain, surrounding nearly the entire eminence; and on the middle hill, at the same level, we find a similar plain, stretching at some points to a breadth of 160 feet. Being thirty feet below the summit of the middle or highest hill, this terrace, which is No. 1 of Mr Kemp's series, stands at a height of 1300 feet above the sea. Meigle Hill, to the south-west of Galashiels, nearly equals the Eildens in altitude, and on it, around a central rocky crown, we find a shelf distinctly marked, and corresponding perfectly, when the level is taken by instruments, with those on the two Eildons. It is remarkable, that on the eastern side of this shelf on the Meigle hill, there is a large *boulder* of greywacke, well rounded, and with a number of cup-like cavities in it, giving it the appearance, altogether, of having been long exposed to the action of water. It is called, by the people of the district, Wallace's Putting-stone.

Terrace No 2 of Mr Kemp's series is equally well seen on the Eildons from a little distance. It lies fifty feet lower than No. 1, and is particularly marked on the west front of the eastern hill. On the western and northern sides of Meigle hill, it is also visible, the northern shoulder presenting a plane 300 feet in diameter at some points. No 2 is also visible near the summit of Williamlaw, a very remarkable hill on the course of the Gala, and which is high enough to fall within its scope. Terrace No. 3 stands fifty-eight feet lower than the preceding one, and is beautifully marked on the middle Eildon, as well as more slightly on the eastern one. It likewise appears in the shape of a plain of greater or less breadth on two sides of Meigle, and on the south and north of Williamlaw. No. 4, lower by fifty-two feet, is but slightly apparent on the Eildon hills, but perfectly distinct, at an accordant level, on Meigle and on Williamlaw. No. 5, again, lies sixty-four feet below its predecessor. "At this level (says Mr Kemp, in the notes which he has been good enough to communicate,) a very great mass of the hill, upon the south side of the eastern Eildon, has been swept down and planed, forming a beautiful shelf of about three and a half acres, with the rock rising bare and precipitous above; and upon the northern sides both of the same hill and the middle one, the same shelf is distinctly defined, and about 160 feet in breadth. It is also very well marked upon Meigle and Williamlaw." Between this terrace and No. 6, there is an intervening space of forty-five feet. Though barely visible on the Eildons, No 6 is well seen on Meigle and Williamlaw. The terraces now begin to be marked on other and lower hills of the district, but, to save confusion, we shall allude afterwards to the corroborative evidence derived from these, and confine our present account of the series chiefly to the hills already named. No. 7, fifty-five feet lower, is pretty well traced on the Eildons, and extends to a breadth of 120 feet on some portions of Meigle. On the southern exposure of Williamlaw, it commences a range of magnificent terraces, forming a shelf 120 feet broad in some parts. No. 8, fifty feet beneath the preceding, is discernible with case upon portions of the Eildons, Meigle, and Williamlaw. Mr Kemp found considerable difficulty in making out No. 9 (fifty feet lower), but tracked it ultimately to his satisfaction on Meigle, Buckholm hill, and Williamlaw.

Terrace No. 10, which stands fifty-five feet beneath No. 9, is every way a remarkable one. "It was that (says Mr Kemp) which first attracted my attention. The Eildon hills assume their conical form immediately above this shelf, which is about 300 feet broad around nearly the whole of their northern sides, and slopes gently downwards. It is the highest of a series on Galashiels hill, and forms around the north-eastern summit of that eminence a fine level plain 110 feet broad. On the south-east side of Buckholm hill, it has the appearance of a perfectly horizontal road for a long way round the height. On the west side of the same hill, on Williamlaw, and on others, it appears very distinctly, varying in breadth from a slight trace up to 300 feet. I have traced this terrace where no other was to be seen, and nowhere was it absent where the level admitted of its presence, and where others were to be found." Along the sides and indentures of the hills, on the Tweed, Gala, Ettrick, and the Cadon (both of which latter streams join the Tweed three or four miles to the south of Galashiels), Mr Kemp observed this terrace, and he continues to remark that the sea seems to have swept so long round the hills at this level, as to have washed down their sides to a great extent, carrying away the traces of the superior beach. On this supposition, at once ingenious and rational, he accounts for the scanty traces existing of terrace No. 9. No. 10 stands at a height of 821 feet above the sea.

Terraces No. 11, 12, 13, 14, and 15, the lowermost of which lies 285 feet below No. 10, and 536 above the level of the sea, are found on the cultivated parts of the country around Galashiels, and, in fact, form the broad arable hill-slopes of the district. Culture with the plough, and wooding, certainly interfere with the distinctness of their appearance in some respects, but Mr Kemp holds these inferior shelves, and even a still lower one, to be well made out, and equally unambiguous in their character with the upper ones.

Thus the observations of Mr Kemp give us (at least) fifteen well-marked lines of terraces in this district, the highest 1300 feet above the level of the sea, and the lowest 536, which gives an average interspace,

* Mr Kemp has discovered a sixteenth terrace, lower than any of the preceding ones, and almost equally well defined. The calculations in the paper, however, were completed before this could be added.

Digitized by Google

in the case of each pair, of fifty-four and a half feet.* At so many different and successive land-levels must the sea have stood for long periods during the ages of the past, if these conclusions be correct; and it is to be observed that Mr Kemp, with indefatigable patience and industry, has accumulated a body of evidence on the subject, which almost clears it from all doubt. Besides his observations in the immediate vale of Galashiels, he has examined the vales of the Tweed, the Ettrick, the Gala, the Cadon, and other lesser streams which permeate the hills of the district, to distances of five, six, seven, and eight miles, and in all he has found these terraces present in greater or lesser numbers, according to the character and altitude of the hills examined, and *always at parallel and corresponding levels*. It is equally creditable to his powers of observation, and corroborative of his argument, that he has, as he says, found "no errors to correct" during his whole course of inquiry. He has used an accurate instrument in taking his levels, and has carried his examinations from hill to hill, across valleys, and in all possible directions. In whole, he has examined a circuit of country fully ten miles in diameter.

Anxious to have a satisfactory view of these wonderful natural phenomena, and at the same time to subject them to the test of impartial observation, the writer of the present paper, as previously mentioned, travelled over a considerable portion of the Galashiels district in company with Mr Kemp. The hill first visited was Williamlaw. The southern front of this height, which is the side most exposed, presents some appearances, which seemed at first completely contradictory of the theory of the horizontal marine beaches. A regular and nearly parallel series of broad and strongly marked ridges are there seen, but these are not horizontal. They are clearly and undeniably inclined, and at a considerable angle, occupying and crossing the whole front of the hill from summit to base. "Viewed at a distance (says Mr Kemp), the sloping aspect of these terraces appeared inexplicable; but on a closer inspection, the mystery vanished." The hill is composed, in that region, of successive beds of hard blue grey-wacke, alternated with layers of soft blue slate. The strike of the stratifications corresponds with the slope of the superficial ridges, and these ridges, as a close inspection shows, must have been produced by the action of the sea at its successive levels, the softer intervening materials being washed out, and the hard stratifications left comparatively bold and prominent. This is made perfectly apparent when the hill is examined in *profile*. Then do we find distinct protuberances, running horizontally across the sloping ridges at nine different elevations, which correspond in their respective levels with the terraces on the neighbouring hills, from No. 7 to No. 16. That these are the traces of sea-beaches is beautifully proved on rounding the hill, where, in the absence of the same superficial strata, the waters have produced their usual effects, in forming *horizontal* beaches at the *same levels* as the protuberances mentioned. With a good pocket spirit-level, Mr Kemp not only demonstrated that these terraces were horizontal, but by turning the instrument to the shelves on the opposite side of the vale, and in fact to all the hills around, showed the existence upon them, at various points, of terraces, at the identical levels of those on Williamlaw. This hill, therefore, instead of forming an anomaly among its neighbours, is in reality a curious and striking proof of the accuracy of Mr Kemp's conclusions; and the mode in which its sloping ridges are to be accounted for, may yield a useful lesson to all future inquirers into this subject. The examination of the strata will in all probability remove every similar difficulty.

On a visit, also, to the Abbotsford hills, and the Eildon district, the writer had the advantage of receiving ocular satisfaction with regard to the terraces upon these and the surrounding heights. It is unnecessary, however, that he should do more here than add his testimony to the accuracy of Mr Kemp's observations and deductions. One hill only may be mentioned, as affording peculiarly beautiful specimens of these terraces. It is a hill named Cathie, immediately below the village of Stow, and on the line of the Carlisle road along the Gala. Six or seven terraces, perfectly horizontal, and running parallel to one another, may there be observed by any passing traveller.

It is only by actual personal inspection, perhaps, or at all events by the aid of drawings, that the existence of these terraces can be fully demonstrated. But believing, as we do, that almost every district of Scotland, to go no farther, will be found to present similar traces on a close examination, conviction will ere long be forced upon every one. The cause, most certainly, of their having remained so long undiscovered, is the comparative irregularity of their extent and appearance. Every spot has not been so favourable for their regular formation as the Glenroy vale, and those around it. Many causes must have contributed to prevent the beach-marks of the sea from being uniform in their aspect in ordinary situations. In the first place, ere the hills were raised step by step from the ocean, their sides were probably irregular in form and inclination, to a considerable extent. Again, their composition was most certainly of a varied kind, harder or softer as it might be, and, of course, liable to different degrees of attrition. Thirdly, an archipelago of islands, such as Scotland must have been during the formation of these terraces, would be liable to strong and numerous currents, calculated greatly to affect the deposition of beaches. The same agents would also cause the frequent obliteration of beaches previously formed, by the undermining influence of the waters when in active motion. Rains and storms, also, must have had their effect in producing similar results. In short, if we consider the subject well, we shall find little difficulty in accounting for the irregular extent and appearance of these beaches of the ancient seas, as well as for their entire absence in many cases. Where they occur in a peculiarly regular series, as on Williamlaw Hill, they are nearly of a uniform breadth and extent. The hill there is regular in structure, and one beach has not been enlarged at the expense of another. On those hills and portions of hills, however, where some members of the series are wanting, or nearly so, we usually find those present to have the form of broad and ample shelves, two or more having been run into one by the action of the waves; as, for example, in the case of No. 4 and No. 5 on the Eildons, and also No. 9 and No. 10 every where. The average distance between each pair being only fifty-four and a half feet, it is perfectly reasonable to suppose that the undermining of one beach by another, and the consequent union of the two, must have been of frequent occurrence. Some terraces have been mentioned, that extend to a breadth of several hundred feet. After this explanation, their irregularity and amplitude will excite less wonder than it might otherwise have done, in the minds of those who remember the comparatively limited and regular breadth of the Highland terraces.

It was remarked that the discovery of these sea-beaches in a district never suspected to contain them, involved a new step in geology. It has long been suspected, and particularly since Mr Lyell made public his extraordinary labours both in the path of original research and of generalisation, that our present lands had been elevated from the waters of the ocean; but, if phenomena analogous to those of the Galashiels district prove to be discernible in other parts of Britain, we shall have gained a novel insight into the manner in which the process of elevation has been accomplished. We shall possess what may be called absolute proofs, that the land has been raised by successive stages, and with intervening periods of rest, from the bosom of the deep, presenting ultimately to man the firm platform necessary for him to move upon, and whereon to work out the great problem of his existence.

* These calculations of Mr Kemp, it is proper to say, were based on the altitude of the Eildons, as computed by previous observers.

ELEPHANT-HUNTING AT THE CAPE.

Lieutenant Moodie, in his amusing "Ten Years in South Africa," gives the following account of his elephant-hunting:—

Some months after forming my new settlement, I engaged a Hottentot to shoot elephants and buffaloes for me, on condition of receiving half of the profits. This man, who was called Jan Wildeman, was a most expert hunter, rarely failing to kill on the spot whatever he fired at. He was a complete wild man of the woods, and had as many wiles as a fox in escaping the dangers to which he was daily exposed. His activity was most extraordinary; and I was often surprised with his nimbleness in climbing the highest trees to get at the wild vines growing over their tops. While I was considering how I could get up, he would take hold of one of the "baboon's ropes," as they are called, which hang in festoons from the branches, and in a few seconds he would be perched like a crow on the top, enjoying my surprise, and flinging down whole bunches of the fruit.

Though naturally timid, he had acquired by long practice such entire confidence in the correctness of his aim, that he would go right up to an elephant in the woods, and bring him down with the first shot. Sometimes, however, his gun would miss fire, when he had to betake himself to his heels, and, by his agility and address, never failed to effect his escape. His adventures of this kind would fill a volume.

Wildeman came to inform me one evening that he had shot three elephants and a buffalo; and that there was a young elephant still remaining with the body of its dead mother, which he thought might be caught, and brought home alive. There happened to be two friends with me from the district of Albany, who had never seen an elephant, and whom, therefore, I persuaded to accompany me.

As soon as we had finished our breakfast, we set off, accompanied by Jan Wildeman, my Hottentot Speulman, and their wives, to assist in cutting up the buffalo, and carrying the flesh home.

Entering the forest, Jan first brought us to the carcass of the buffalo; but the fellow was so lazy that he had not taken out the entrails, and, the weather being warm, the flesh was unfit for use. He next led us to one of the elephants he had killed, and showed us the spot whence he had fired. The ball had entered the shoulder in a slanting direction, and passed through the heart. This was an exceedingly difficult shot, as he required to be very near to hit the right place, and for the ball to penetrate through such a mass of skin and flesh.

In shooting elephants, it is necessary to be provided with balls made of an equal mixture of tin and lead, as lead balls generally flatten on the skin or bones. Our ignorance of this circumstance at Fredericksburg, accounts for the trouble we experienced in killing the elephants there.

After following several of the paths made by these animals, and struggling through the tangled mazes of the forest, we ascended a steep sandy ridge, covered with low bushes, near the shore; and on reaching the top, we came in sight of the carcass of another of the elephants, and the young one standing by it. At a few paces' distance, we saw a large elephant browsing among the low bushes. He smelt us as soon as we appeared on the top of the hill; and throwing up his trunk, and spreading out his huge ears, uttered a most discordant cry. "Gownatsi!" ejaculated Jan Wildeman, "that's the rascal that gave me so much trouble yesterday; he's as cunning as the devil."

The dogs instantly assailed the animal, and after several ineffectual attempts to seize them with his trunk, he made off. The dogs now attacked the young elephant, and chased him up the steep sandy hill where we were standing. My visiters, who were unaccustomed to large game, were exceedingly agitated. They had brought a gun with them for form's sake, but had neglected to load it. One of them, who was a Scotsman, seized me by the coat, and cried out in great agony, "Eh! man, whaur'll we rin?—whaur'll we rin?" It was no use telling him that there was not any danger, for he still kept fast hold of me, saying, "What, me danger, man, and the beest comin' right up amang us! I say, man, what'll we do?—whaur'll we rin?" The women instinctively ran and squatted themselves down behind the bushes.

As soon as I could break loose from the grasp of my countryman, I ran to endeavour to seize the young elephant by the trunk, and Speulman took his stand on the opposite side for the same purpose. I was astonished at the nimbleness with which the animal ascended the steep hill. As he approached the spot where we stood, we found he was much older than we expected, being nearly as large as an ox; and, after making an ineffectual attempt to get hold of his trunk, we were obliged to give him a free passage between us. I now picked up my gun, and gave chase to him; but he ran so fast that I could not overtake him.

I was well pleased we had not succeeded in seizing him, as, in all probability, he would have done us some serious injury with his tusks, which were just appearing at the root of the trunk. When they are only a few days old, there is no difficulty in catching them, and they become docile almost immediately. Several attempts have been made to rear them with cows' milk, but without success.

It is remarkable that the young of the elephant, when a few days old, are not much higher than a young calf; but their bodies are rounder and more bulky. It is also a curious circumstance, that the carcasses of elephants which have died a natural death, are never found by the natives in the woods where they are most abundant.

A CANADIAN EMIGRANT'S LETTER.

[The following plain matter-of-fact letter of a Canadian emigrant, from the parish of Beith in Ayrshire, appeared lately in a respectable provincial newspaper, the Ayr Advertiser.]

We had an excellent, I may say pleasant, passage of thirty-three days to New York, whence we sailed up the Hudson to Albany. About thirty miles farther, I left my family at the house of Mr James Holms from Beith, and set out on a tour to the west, resolving to have a view of those fine prairie lands described by Stewart and others in such a flattering way. I travelled by the Erie Canal, passing through many thriving towns to Buffalo. This is also a busy place, and rising fast. From thence I took a steam-boat to Cleveland, in Ohio, and travelled through that state, sometimes on the canal to the Ohio river. On my route, I saw some excellent land and fine thriving towns; but the land where I travelled, in a general way was rather broken and rather poor, and apparently not very good for wheat, but good pasture, and in general the cattle were good. Saw some places there that pleased me well; but they were rather dear for me to purchase, rating from thirty to one hundred dollars per acre. On arriving at the Ohio river, took a steam-boat for Cincinnati, which is a fine city, and rising fast. From thence sailed down the river for Louisville, the prettiest little city I have seen in America; but the curse of slavery is there. * * From thence sailed for St Louis, in Missouri, on the banks of the Ohio and Mississippi rivers. The land is very rich, but the people look unhealthy; and I found that bilious fever and ague prevail in those flat places a good deal. St Louis is an excellent city for business, but inhabited by a rough people. I was much disgusted with the practice that generally prevails in these slaveholding states, of carrying what are called *bowie knives*; and it is not at all uncommon that fights take place, and people are killed. The common people wear those knives in a sheath at their side. They are like those used by fleshers, but rather sharper at the point. Those carried by gentlemen are similar to pocket-knives, and have a blade about six inches long, which, when opened, will not shut without pressing a spring on the back. From St Louis I sailed up the Mississippi, passing the mouth of the Missouri and Illinois rivers and the city of Alton, which stands on a rugged limestone height, or bluff, as they are called, on the Illinois side of the river, and near the mouth of it. Alton is increasing rapidly. Numbers of the houses are built of stone, which is not the case in many places I have seen in America, where they are generally built either of brick or wood. I kept sailing up the Mississippi upwards of a hundred miles farther, and then travelled across the state of Illinois a considerable distance. The quality of the soil, and the general appearance of the country, pleased me much, except in places where the land is flat and swampy, which is often the case near rivers; and, in general, so far as I travelled in Illinois, the land is rather level; but still these prairies were inviting to the eye of people accustomed to live in an open country. Wages for work

Digitized by Google

men of all kinds are very high, and people may get a living with the half of the labour they will do in Scotland. In the neighbourhood of Jacksonville, fine land in cultivation could have been got, for from six to ten dollars an acre. The principal crops raised in these western states, so far as I travelled, were Indian corn, some oats, and a little wheat now and then. Potatoes also grow well; but the farmers depend most on cattle, hogs, and corn. Some of the farmers have several hundred hogs, part of which they fatten with corn in the fall, and dispose of for slaughtering. I had the offer of an excellent farm of 600 acres, for six dollars an acre, 400 acres of it prairie, and the rest woodland—250 acres of it fenced and improved, and situated in a good place for markets, being not more than twelve miles from the Illinois river, and about the same distance from a town of considerable extent; but the sickly appearance of the people frightened me. They appeared either to be indolent, or unable to labour; and, so far as I saw in these new countries, they had a very bilious appearance; and from what I have since learned from people that have resided in them for some time, my conjectures were right. Although I cannot say that Stewart has exaggerated the beauty of the country and goodness of the land, he has not told all the truth; he has not alluded in the way he ought to the sickliness of the country. Fever and ague prevailed to a considerable extent in Illinois last fall, so much so that the medicines used for the cure of the disease became scarce, and rose to an enormous price. Stewart gives too favourable an account of the American people. I admit there are many very intelligent, respectable people in the United States; but, generally, the working-people I fell in with were haughty, proud, and insolent; and if you asked any thing of them, the general answer was, "I don't know," in a manner not to be misunderstood. Considering the unhealthy appearance of the people in the new states, where land could not be got at a price to suit me, and not yet being so much of a republican as to wish to live in a country where the mob govern, I made up my mind to settle in Canada, as I there found the people and manners more agreeable to me than in most places of the States. On the morning after my arrival at Toronto, I was accosted by Mr John Somerville, from Beith. He kindly invited me to his house, where I was treated in a very friendly way both by Mr and Mrs Somerville. Mr Somerville appears to be getting on well, is a man of good abilities, and well qualified for the situation he fills in the bank. I remained in Canada about ten days. Before leaving it for the States, I saw some fine farms for sale, which would have suited me well, and were selling for two-thirds of their value. Numbers of the people that were disaffected to the government, and suspected of having a share in the rebellion, were anxious to sell their property, and go to the States; but, after all, nothing would satisfy me till I had a better view of the States. I went to Hamilton, from thence to Paris, a distance of about seventy miles, and staid two nights with Dr M'Cosh. I also staid a night with a Mr Dickie; he and his family have 400 acres of good land, and say they have done much better than they could have done in Scotland. On returning to Canada, I got a farm that pleases me very well; although, had I had the sense to have purchased a farm which was offered me when I first arrived in the country, I could have had a property worth £200 more for the same money I paid for the one I got. Still we have not much reason to complain. Farms have sold since we came here that would let to pay ten per cent. interest. The general rate is from two to three dollars of rent per acre for the land cleared on the farm; and if the tenant chooses to clear more of the woodland, he may do so without paying any more rent. Property has sold better this season than last; still many respectable people are leaving the province for the States, in despair of the grievances of the province being redressed without a separation from Britain. So far as I can judge, the people are generally loyal to the British government, and have a strong wish to continue under her protection; but—[Here the writer enters on the field of politics, explaining the cause of existing distresses in Canada. On this topic we have neither the power nor the inclination to intrude; and, in conclusion, only offer one piece of advice to intending emigrants, which is, *to abstain by all means from proceeding to any part of Canada till its affairs are settled fully to the satisfaction of its inhabitants.* The fevers and bowie knives in some parts of the states, to which the writer adverts, are not more distressing in their effects than incessant political broils and the prospect of civil warfare.]

HINTS TO DANCERS.

We go to a ball. Mercy upon us! is this what you call dancing? A man of thirty years of age, and with legs as thick as a gate-post, stands up in the middle of the room, and gapes and fumbles with his gloves, looking all the time as if he were burying his grandmother. At a given signal, the unwieldy animal puts himself into motion; he throws out his arms, crouches up his shoulders, and, without moving a muscle of his face, kicks out his legs, to the manifest risk of the bystanders, and goes back to his place puffing and blowing like an otter, after a half-hour's burst. Is this dancing? Shades of the filial and paternal Vestris! can this be a specimen of the art which gives elasticity to the most inert conformation, which sets the blood glowing with a warm and genial flow, and makes beauty float before our ravished senses, stealing our admiration by the gracefulness of each new motion, till at last our soul thrills to each warning movement, and dissolves into ecstacy and love? Maiden, with the roses lying among the twinings of thy long red hair, think not that the art of dancing consists merely in activity and strength. Thy limbs, which are none of the weakest, were not intended to be rivals with a pavier's hammer; the artificer who trimmed thy locks had no idea that his labours were to be lifted three feet higher than thy natural height from the ground; spare thyself such dreadful exertion, we beseech thee, and consider that thine ankle, though strong and thick as St George's pillars, may still be broken or sprained with such saltations.—*Blackwood's Magazine.*

THE TWO ROSES.

When summer has given a golden hue to the corn waving in our fields, flowers of all kinds abound in Paris—the variegated carnation, the proud-stalked tulip, the fragrant lilac, are to be bought at every corner, and lend their beauty and their fragrance alike to the duchess or the *grisette*, for then nature in her abundance is rich enough to supply the desires and caprices of both.

In the first few fine days of spring, when the frost still spreads a frozen mantle over the verdure of the field, the case is far different—flowers then are scarce, and many a bud is nipped before its hour—and roses and camelias belong to the rich alone, for they are worth their weight in gold.

We now proceed to explain how two roses could bring two ladies before a court, and why Madame Gallien, a dressmaker of note, should claim thirty francs damages from Mlle. Flora Minnett. But Madame Gallien shall speak for herself.

Madame Gallien.—About two months ago, the Prince of C. T. married Mlle. Leontine de C. The *corbeille* and *trousseau* were to be magnificent. I received the order for making the ball-dress of the bride—it was to be a *chef-d'œuvre*. Lace and pearls, and guypure, were to unite and bring out something lovely—but even those rare materials were not reckoned sufficient; something still rarer was to be added, viz.—a white rose at the end of February.

The Magistrate.—I suppose it was Miss Flora who promised to procure you this rare production!

Madame Gallien.—It was, please your worship. She has long been in the habit of cultivating flowers, and supplies all the great *modistes* of the capital with the choicest and rarest articles. I went to her, explained the purport of my call, and she promised to give me one of the two roses that she was rearing, on my giving her twenty-five francs [one pound] on delivery. I relied on this promise, but she did not fulfil it; no white rose came, and the wedding-dress was refused as the rose was wanting.

The judge here inquired of the defendant why she had not sent the rose as she had agreed to do.

Mlle. Flora (timidly).—I can assure you it was not my fault. On the very eve of the day on which I had promised to send the rose to Madame Gallien, a shower of rain having fallen during my absence, a few hours after nothing but the stalk remained. What I have just said is truth itself.

The Magistrate.—I believe you speak the truth, but why did you not send the other rose?

Mlle. Flora.—Oh, that one was not promised. Had I promised it, Madame Gallien would have doubtless accepted it, for it was the finer of the two; but I would not offer it, for it was destined to my mother.

The Magistrate.—It was perhaps her *fête* day.

Mlle. Flora.—No, sir; it was the anniversary of the day of her death. Every year I take to her grave at Montmartre a white rose, for she greatly loved that flower. This year I did as I had hitherto done. I said to myself, the bride will be as handsome, notwithstanding her having a flower less, and my mother will have her accustomed homage. In saying this, the affectionate girl burst into tears, and Madame Gallien hastened to console, while the audience seemed deeply affected.

Madame Gallien then addressed the magistrate thus—Have the kindness to quash this case, for I have acted wrong in having attempted to punish this sweet child for having done a good action. Dry up your tears, Mlle. Flora, and let the business drop; and may I one day have a daughter like you.

The magistrate, who seemed much affected by the scene, ordered the case to be quashed, and the two females left the office together.—*From a newspaper.*

DEAN SWIFT.

An instance of the bold and decisive measures which sprung from the proud ardour and defiance of Swift's character, is vividly sketched by the pen of Dr Sheridan: "During the publication of the Drapier's Letters, Swift took great pains to conceal himself from being known as the author. The only persons in the secret were Robert Blakely, his butler, whom he employed as his amanuensis, and Dr Sheridan. As Robert was not the most accurate transcriber, the copies were always delivered by him to the docter, in order to their being corrected, and fitted for the press, by whom they were conveyed to the printer in such a way as to prevent a possibility of discovery. It happened that Robert Blakely, the very evening of the day on which the proclamation was issued, offering a reward of L.300 for discovering the author of the Drapier's fourth letter, had staid out later than usual without his master's leave. The dean ordered the door to be locked at the accustomed hour, and shut him out. The next morning the poor fellow appeared before him with marks of great contrition; when Swift would listen to none of his excuses, but, abusing him outrageously, bid him strip off all his livery, and quit his house that moment. 'What—you villain,' said he, 'is it because I am in your power, you dare take these liberties? Get out of my house, you scoundrel, and receive the reward of your treachery.' Mrs Johnson, who was at the deanery, and greatly alarmed at this scene, immediately dispatched a messenger to Dr Sheridan, to come and try to make up matters. Upon his arrival he found Robert walking about the hall in great agitation, and shedding abundance of tears; inquiring into the cause of this, he was told that his master had just discharged him. The doctor bade him be of good cheer; for he would undertake to pacify the dean, and that he should still be continued in his place. 'That is not what vexes me,' replied the honest creature; 'to be sure I should be very sorry to leave so good a master; but what grieves me to the soul is, that my master should have so bad an opinion of me, as to suppose me capable of betraying him for any reward whatever.' When this was told to the dean, struck with the generosity of such a sentiment in one of his low sphere, he immediately pardoned him, and restored him to favour. He also took the first opportunity in his power of rewarding this man for his fidelity. The place of verger to the cathedral soon after becoming vacant, Swift called Robert to him, and asked him if he had any clothes of his own that were not a livery; to which the other replying in the affirmative, he desired him immediately to strip off his livery, and put on those clothes. The poor fellow, quite astonished, begged to know what crime he had committed, that he should be discharged. 'Well—do as I ordered you,' said Swift. When he returned in his new dress, the dean called the other servants into the room, and told them they were no longer to consider him as their fellow-servant Robert, but as Mr Blakely, verger of St Patrick's Cathedral, which place he had bestowed on him as a reward for his faithful services. The grateful creature poured forth a thousand blessings on him, and begged, as the greatest favour he could confer on him, that he might still be continued in the same station without fee or reward, as he was sure no one could give such satisfaction to his master in the discharge of it as himself. As he was an excellent servant, and was accustomed to all Swift's peculiarities, the proposal could not but be very acceptable to the dean; and Mr Blakely accordingly continued to officiate in that capacity for some time as a volunteer, without any of the badges of servitude. But the master was too liberal to accept the generous proposal made by the servant; for, though he paid him no wages, he took care, by handsome presents, to make him a full equivalent."—*Dublin University Mag.*

SONNETS ON THE FALLS OF CLYDE.

STONEBYRES.

Words! ye are powerless—at this scene of power,
Feebly and idly from the tongue ye fall:
Heart! bear me witness how I felt that hour—
The dim lone hour, when, night with veiling pall
Deep'ning its wildness, Stonebyres met my sight.
The white foam, flashing through the gulf profound,
Made e'en stern midnight wear the smile of light,
And the huge tumbling mass shook all around.
I look'd below; each hand, a rocky steep
Guarded the calm'd and wider-bending stream:
Wild trees, their love revealing e'en in sleep,
Bent o'er the wave, whose murmurs bade them dream.
There Peace might joy to watch the peeping flower—
Above, reigns one solo thought, which speaks in thunder—power.

CORRA LINN.

Thou speak'st with tongue of tempest, Corra Linn!
Shaking the heart; thou tell'st in awful tone
How frail earth's tenant, proud, tho' slave to sin—
How grand is He, who hath uprear'd his throne
On the firm hills; who utters forth his word,
The voice of many waters; bids the tree
Bloom o'er the stream that feeds it, and the bird
Blend with thy roar its fainter melody.
Who bids the drops which on the mountains fall,
Commingling, deep'ning, valeward force their way,
Thundering through cliffs, till ocean swallows all,
Whence rich-dew'd clouds the debt to earth repay:
Who in that bow,* at anger smiling still,
Paints, in the sun's own light, the pledge of Heaven's good will.

THOMAS LISTER, *Barnsley.*

* The rainbow in the basin of the fall.

MANNERS AND TASTES OF NATIVE INDIAN SOCIETY.

Childish and barbarous as we must admit a large portion of the amusements of the native society of India to be, yet there can be no question of their capability of enjoying much more intellectual pleasures. There are, it is true, whole castes and classes of persons so extremely ignorant as to appear to be guided by instinct rather than by reason, and whose natural stupidity seems to render improvement perfectly hopeless; but the major portion are intelligent and of cultivated tastes, which in many parts of Europe, and certainly in England, are confined to persons of a superior grade. It is but very lately in this country that the lower classes have begun to relish the refinements of music, or that the street ballad-singers have given way to minstrels of higher pretensions. But in Hindostan the same air that delights the prince is the solace of the peasant, and the tale that is told in the palace is repeated under the thatch of a cottage. It will perhaps be a very long time before any Asiatics of any rank can be taught to appreciate the divine compositions of the great masters of the art, since they have no such thing as connected music—the greater the number of instruments employed, the greater being the discord; but the simple melodies, consisting of a few sweet wild notes, struck upon a guitar, and perchance accompanied by a voice richly gifted by nature, comes home to every feeling heart. These popular airs are common all over India, and are often heard in the most remote and unfrequented places, breaking the silence of the summer night on the banks of lonely rivers. —*Asiatic Journal.*

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 445. SATURDAY, AUGUST 8, 1840. PRICE THREE HALFPENCE.

PEEPS INTO THE WORKSHOPS OF LITERARY MEN.

LITERATURE, though it never can be practised with success except by men endowed with peculiar and suitable faculties, is also to be regarded as an art, which, no more than any other, can be exercised without a certain degree of acquired skill. It stands, however, in an uncommon position as an art, for it has no apprenticeships, no recognised academies of instruction, no grades of teachers and scholars, but is usually taken up by each isolated student at his own hand, and with only such aid as he can derive from what he chances to know of the habits of others, or as his native good sense may lend to him. Such being admitted as the case, it becomes a somewhat important as well as curious subject of inquiry, what have been the ways and modes assumed or followed by the first masters of the art.

Sir Walter Scott was a rapid writer. We have his own testimony that the second and third volumes of Waverley were written in three weeks, and Mr Lockhart states that twice the time sufficed to produce the whole of Guy Mannering. He composed a large part of his Life of Napoleon at the rate of sixteen printed pages per day, which would give a volume of that work in little more than the time taken to fabricate a volume of Guy Mannering—a wonderful effort, when we consider the necessity of referring to authorities. On the other hand, it must be acknowledged that Scott was not a correct writer. In his manuscript, sentences were often left unfinished; awkward peculiarities of phrase, including Scotticisms, abounded; and it is evident that the Life of Napoleon would have been at this day a better authority, if it had been written more deliberately. Much of his poetry is as slovenly as his prose. The manuscripts of Scott were all latterly first draughts. He did not even read over what he had written, before sending it to the press. It was also remarkable of him, that he wrote his novels without plan or premeditation of any kind, one scene or combination of characters suggesting that which was to follow, until he was called upon by the printer to close in the work. The press following close at his heels, it was impossible for him to go back and accommodate any past part to that for the moment under his hands. It is wonderful that, in such circumstances, he has written in general so happily; but it must also be owned that the conclusions of his works are usually hurried and unsatisfactory. We believe that, in at least one instance, he found himself compelled to change the original destination of an important character, by concluding "the Fair Maid of Perth" with the marriage of the heroine to the blacksmith. Taking the first description of this person in connexion with the contemporary burnings for the Bohemian heresy, it is evident that he designed her for martyrdom.

The Telemachus of Fenelon was written in three months, and there were not ten erasures in the original manuscript. The author, says D'Israeli, had previously "formed his style, and his mind overflowed with all the spirit of the ancients." "The same facility," adds the same writer, "accompanied Gibbon after the experience of his first volume; and the same copious readiness attended Adam Smith, who dictated to his amanuensis while he walked about his study." Yet Gibbon had spent seven years in preparing for his work, and the Wealth of Nations, one way and another, was the labour of ten years.

It is remarkable, considering the mercurial character of the French, how slowly and carefully many of them have written. Malherbe, usually called the father of their poetry, composed with prodigious tardiness, and racked his brains to correct what he had written. He used to say that a poet, after writing a hundred good verses, ought to repose for ten years! The style of La Fontaine's tales conveys the impression of easy and rapid composition; but in reality these tales were written and polished with the most laborious care. Beranger is also a slow writer, "frequently laying aside the subject on which he is employed for several weeks, and patiently waiting until, by dint of long reflection on the subject, and careful polishing, by the selection of the happiest allusions, by the studious exclusion of every phrase or illustration that appears recherché or ornate, he has given to the whole that unity and appearance of ease and simplicity at which he constantly aims."* Madame Dacier translated some parts of Homer six or seven times, and would, after all, add on the margin of her copy, "*I have not done it yet.*" Pascal, writing his Provincial Letters, spent twenty days on some one of the number, and re-wrote the beginnings of several six or seven times before being satisfied.

It has been somewhere insisted on as a curious fact, that the writings of Rousseau, in which simplicity of language is so prominent a feature, were written with vast care—the author sitting, too, in full dress, and using the finest gilt-edged paper—while the papers of the Rambler, in which the style appears so cumbrous and laboured, were thrown off with great rapidity, and sent in hot haste to the press. This is apt to lead to some misconception of Johnson's literary habits. He certainly wrote rapidly, the Rasselas being the composition of *the evenings of a week*, while it is true that the Ramblers were mostly composed immediately before they were printed. But Johnson was also a great memorandist, and a laborious corrector. Even his rapidity was allowed by himself to be the result of early self-discipline. "He told him [Sir Joshua Reynolds] that he had early laid it down as a fixed rule to do his best on every occasion, and in every company; to impart whatever he knew in the most forcible language he could put it in; and that, by constant practice, and never suffering any careless expressions to escape him, or attempting to deliver his thoughts without arranging them in the clearest manner, it became habitnal to him."† At least thirty papers were written from prepared memoranda. His mind also contained a vast store of unwritten observation and thought, which he was ready to pour forth as it was required. While these circumstances are to be taken into consideration, it might also, we think, be shown that a rolling, measured style, like that of Johnson, requires less time than a simple style like that of Rousseau and Beranger. For the latter, it is necessary that the mind should be *chastened down*, which requires time. Johnson's corrections on his compositions were not known to the literary world, till elucidated by Mr Alexander Chalmers in his preface to the Rambler. It was shown by that gentleman, that, between the *sheet edition* of these essays and the first reprint of them as a book, thousands of corrections had been made by the author, indicating a thoughtful regard for propriety of expression, and productive of an inconceivable improvement in the work. Mr Chalmers produces some specimens of the original papers, marking in *italics* the words which had been altered. We shall copy one passage from the 180th paper, along with the corresponding passage in the corrected edition—thus presenting what, short as it is, must, we conceive, be a very instructive lesson on the subject of composition.

"It is somewhere related by Le Clerc, that a wealthy trader of good understanding, having the *usual* ambition to breed his son a scholar, carried him to an university, resolving to *make* use *of* his own judgment in the choice of a tutor. He had been taught, by whatever intelligence, the nearest way to the heart of an academic, and *soon after* his arrival *opened his purse with so little reserve, and* entertained all who came about him with such profusion *of plenty*, that the professors were *presently* lured by the smell of his table from their books, and flocked round him with all the *importunity* of awkward complaisance. This eagerness *completely* answered the merchant's purpose: he glutted them with delicacies, *he cheered them with wine, he* softened them with caresses, *and by degrees* prevailed upon one after another to open his bosom, and make a *full* discovery of his *schemes of* competition, *his alarm of* jealousy, and *his rancour of* resentment. *Thus after having long endeavoured to learn* each man's character, partly from himself, and partly from his acquaintances, he *at last* resolved to find some other *method of* educating his son, and went away, *fully* convinced that a scholastic life has no other tendency than to vitiate the morals and contract the understanding. Nor *could* he afterwards *bear* with patience the praises of the ancient authors, being persuaded that scholars of all ages must have been the same; and that Xenophon and Cicero were nothing more than professors of some former university, and *were* therefore mean and selfish, ignorant and servile, like those whom he had lately visited and forsaken."

"It is somewhere related by Le Clerc, that a wealthy trader of good understanding, having the common ambition to breed his son a scholar, carried him to an university, resolving to use his own judgment in the choice of a tutor. He had been taught, by whatever intelligence, the nearest way to the heart of an academic, and at his arrival entertained all who came about him with such profusion, that the professors were lured by the smell of his table from their books, and flocked round him with all the cringes of awkward complaisance. This eagerness answered the merchant's purpose; he glutted them with delicacies, and softened them with caresses, till he prevailed upon one after another to open his bosom, and make a discovery of his competitions, jealousies, and resentments. Having thus learned each man's character, partly from himself, and partly from his acquaintances, he resolved to find some other education for his son, and went away, convinced that a scholastic life has no other tendency than to vitiate the morals and contract the understanding. Nor would he afterwards hear with patience the praises of the ancient authors, being persuaded that scholars of all ages must have been the same; and that Xenophon and Cicero were professors of some former university, and therefore mean and selfish, ignorant and servile, like those whom he had lately visited and forsaken."

Pope, as might have been expected, was a slow and painstaking writer. In translating the Iliad, he considered fifty verses a-day as good work. The first draughts of that poem, which are preserved in the British Museum, show many erasures and interlineations, and, besides these, many passages which the author had altered before the poem was published. Parts of the first draught have been published by Johnson and D'Israeli, and may be referred to as very instructive examples of the labour of a literary artist of the first order to give finish to his work. We can only afford space for a very small specimen, namely, the passage in which Hector takes his child from the arms of Andromache. As published by the poet, it is as follows:—

* Article Poetry, Encyclopædia Britannica, 7th edition.
† Boswell.

Digitized by Google

Thus having spoke, the illustrious chief of Troy
Stretch'd his fond arms to clasp the lovely boy.
The babe clung crying to his nurse's breast,
Scared at the dazzling helm and nodding crest.
With secret pleasure each fond parent smiled,
And Hector hasted to relieve his child—
The glittering terrors from his brows unbound,
And placed the beaming helmet on the ground;
Then kiss'd the child, and lifting high in air,
Thus to the gods preferr'd a father's prayer.

Next comes the passage, as it appears in the first draught, on the back of a letter franked by Addison: it will be observed that the lines and words in *italics* were rejected:—

Thus having spoke, the illustrious chief of Troy
Extends his eager arms to embrace his boy,
lovely
Stretch'd his fond arms to *seize* the *beauteous* boy;
babe
The *boy* clung crying to his nurse's breast,
Scared at the dazzling helm and nodding crest.
each *kind*
With *silent* pleasure *the* fond parent smiled,
And Hector hasten'd to relieve his child—
The glittering terrors unbound,
His radiant helmet from his brows *unbraced,*
on the ground he
And on the ground the glittering terror placed,
beamy
And placed the *radiant* helmet on the ground;
Then seized the boy, and raising him in air,
lifting
Then fondling in his arms his infant heir,
dancing
Thus to the gods *address'd* a father's prayer.

Addison was a most careful writer, and spared no after labour in making his compositions correct. Dr Warton relates that, when the entire impression of a number of the Spectator was nearly thrown off, he would stop the press to insert a new preposition or conjunction.* A specimen of the corrections he made upon his first editions has been given by Dr Drake. It relates to the 117th number of the Tatler, and includes some very minute improvements, as—"For *tastes*, read *relishes*; for *times*, read *ages*; for *the* whole, read *a* whole; for *satisfaction*, read *pleasure*; dele *the*; dele *own*; &c."† Savage and Armstrong were also zealous and most scrupulous correctors. Gray would spend a week upon a page, revising and re-revising, till he got it to his satisfaction. Dr Robertson wrote all his sentences on separate bits of paper, and not till he had corrected them into perfect harmony, did he transfer them to his manuscript. Even the peasant bard Burns took great pains in correcting. "Easy composition, but laborious correction," was his own description of his mode of writing.‡ It is not unworthy of notice that Milton was anxious for correct punctuation. Virgil spent eleven years in correcting the Æneid, and, after all, being interrupted in the task by death, was so dissatisfied with the state of his poem, that he wished to have it destroyed. On the other hand, Ovid could not bring his mind to the labour of correction. Shakspeare is said to have never altered a line. And, to descend to a meaner example, the satirist Churchill detested blotting and erasing, which he said was like cutting away one's own flesh.§ Steele was as careless as Addison was the reverse; but his writings are, for that reason amongst others, much inferior. This easy-natured Irishman makes a most characteristic admission in introducing the Tatler. "The nature of my miscellaneous work," says he, "is such, that I shall always take the liberty to tell for new such things (let them have happened never so much before the time of writing) as have escaped public notice, or have been misrepresented to the world; provided that I am still within rules, and trespass not as a tatler any further than *in incorrectness of style*, and writing in an air of common speech."‖ For an author to acquaint his readers that he should probably be incorrect in his style, seems a pitch of impertinence of no common height.

It may be presumed that Young wrote carefully, as he recommends others to do so. In his Epistles, the following passage occurs:—

Write, and re-write, blot out, and write again,
And for its swiftness ne'er applaud your pen;
Leave to the jockeys that Newmarket praise;
Slow runs the Pegasus that wins the bays.
Much time for immortality to pay
Is just and wise; for less is thrown away.
Time only can mature the lab'ring brain;
Time is the father, and the midwife Pain:
The same good sense that makes a man excel,
Still makes him doubt he ne'er has written well.
Downright impossibilities they seek:
What man can be immortal in a week?

Cowper belonged to the same order. He says, in a letter to Mrs Unwin, "To touch and retouch is, though some writers boast of negligence, and others would be ashamed to show their foul copies, the *secret of almost all good writing*, especially in verse. I am never weary of it myself." A striking proof of the good effected by the process in his instance, is afforded by the easy and fluent poem on Friendship published amongst the writings which appeared during his life, as compared with the rough draught of the same poem published amongst his minor poems after his death. Dr Parr gives his opinion on the same side. Writing to Sir James Mackintosh, he says—"A style which is truly good must always, more or less, be the result of effort and art. Write on, write on, and depend upon it, you will soon have the habit of executing narrative well—very well, and I mean to the satisfaction of your own profound penetration and judicious taste. At first there may be the *limæ labor et mora*;* but fluency and rapidity will soon come on, and this I know from my own personal experience." Johnson's advice to a young clergyman was to exactly the same purpose:—"In the labour of composition, do not burden your mind with too much at once; do not exact from yourself, at one effort of excogitation, propriety of thought and elegance of expression. Invent first, and then embellish. The production of something where nothing was before, is an act of greater energy than the expansion or decoration of the thing produced. Set down diligently your thoughts as they rise in the first words that occur; and when you have matter, you will easily give it form. Nor, perhaps, will this method be always necessary, for by habit your thoughts and diction will flow together."† Johnson gave Dr Parr's thought with admirable brevity and pith:—"What we hope ever to do with ease, we must first learn to do with diligence."‡

Three recent Scottish luminaries, Stewart, Leslie, and Playfair, were all of them remarkable as great correctors both in manuscript and proof. We have a very curious account of Mr Playfair's mode of composition, from the pen of Lord Jeffrey: "He wrote rather slowly, and his first sketches were often very slight and imperfect, like the rude chalking for a masterly picture. His chief effort and greatest pleasure was in their revisal and correction; and there were no limits to the improvement which resulted from this application. It was not the style merely that gained by the change; the whole reasoning, and sentiment, and illustration, were enlarged and new modelled in the course of it, and a naked outline became gradually informed with life, colour, and expression. It was not at all like the common finishing and polishing to which careful authors generally subject the first draughts of their compositions—nor even like the fastidious and tentative alterations with which some more anxious writers assay their choicer passages. It was, in fact, the great filling in of the picture—the working up of the figured *weft*, on the naked and meagre *woof* that had been stretched to receive it; and the singular thing in his case was, not only that he left this most material part of his work to be performed after the whole outline had been finished, but that he could proceed with it to an indefinite extent, and enrich and improve as long as he thought fit, without any risk either of destroying the proportions of that outline, or injuring the harmony and unity of the design. He was perfectly aware, too, of the possession of this extraordinary power, and it was partly, we presume, in consequence of it that he was not only at all times ready to go on with any work in which he was engaged, without waiting for favourable moments or hours of greater alacrity, but that he never felt any of those doubts and misgivings as to his being able to get creditably through with his undertaking, to which we believe most authors are occasionally liable. As he never wrote upon any subject of which he was not perfectly master, he was secure against all blunders in the substance of what he had to say; and felt quite assured, that if he was only allowed time enough, he should finally say it in the very best way of which he was capable. He had no anxiety, therefore, either in undertaking or proceeding with his tasks; and intermitted and resumed them at his convenience, with the comfortable certainty that all the time he bestowed on them was turned to good account, and that what was left imperfect at one sitting might be finished with equal ease and advantage at another. Being thus perfectly sure both of his end and his means, he experienced in the course of his compositions none of that little fever of the spirits with which that operation is so apt to be accompanied. He had no capricious visitings of fancy which it was necessary to fix on the spot or to lose for ever—no casual inspirations to invoke and to wait for—no transitory and evanescent lights to catch before they faded. All that was in his mind was subject to his control and amenable to his call, though it might not obey at the moment; and while his taste was so sure that he was in no danger of overworking any thing that he had designed, all his thoughts and sentiments had that unity and congruity, that they fell almost spontaneously into harmony and order; and the last added, incorporated, and assimilated with the first, as if they had sprung simultaneously from the same happy conception."§

Upon the whole, it appears that, for one writer of note who was careless in composition and negligent of correction, there have been at least ten who were the reverse. And even those writers whose works appear the simplest and most natural in style, have generally been remarkable for the pains they took in elaborating their compositions. We humbly think that this affords an instructive lesson, in the first place to literary aspirants, and in the second to all who would excel, whatever may be the department of exertion they have entered upon. When we find that even the most masterly intellects have in general found study, care, diligence, and laborious finish, necessary for success, how vain must appear the folly of all those attempts to *dash off clever things in happy moments*, of which young men are sometimes guilty!—how senseless must appear all efforts at excellence, which are not made in the spirit of laborious application! From our experience in life, we would say that one-half of the failures which occur in literature, in art, in business, in every kind of pursuit, are owing to self-conceit in the aspirant leading him to despise labour, and to suppose that his slightest effort is enough to secure success. Such persons conceive it to be unworthy of *them* to take any particular pains with any thing: it should be enough that *they* try: the effort being made by *them*, success should be certain; as if there were some charm about them which should set all ordinary rules at nought. Such was not the spirit in which Pope warbled his dulcet numbers; in which Johnson threw out his lofty moralisings; in which Cowper, Burns, Virgil, or Horace, wrote their imperishable works. These great men studied hard, and wrote, or at least corrected, with the utmost care. Whatever they did, they thought themselves bound to do as well as they could. Very far was it from them to suppose that whatever they chose to enunciate at random was sure to be good. No; they gave concentrated attention to all that they attempted, and their success was mainly owing to their observance of the maxim, that "whatever we would do well, we must first learn to do with diligence."

LIFE'S VALUE.

A STORY OF BRITTANY.

THE scene of our little story opens in an apartment in an ancient castle in Brittany. The young proprietor is about to quit the abode of his forefathers, to pursue schemes of ambition at court, or in the great world. The family, consisting of the mother and two sisters, with the hero of the piece, are met together on this interesting occasion. But we let the young gentleman relate what passed at the interview.

The time at length came when I should depart; and Joseph, opening the door gently, informed us that the *chaise de poste* was ready. This announcement was startling to my mother and sisters, who, in an agony of feeling, threw their arms around me.

"It is not yet too late!" they exclaimed, with tears; "renounce this intended journey. Oh, do not leave us!"

"My dearest mother," I replied, "at twenty years of age, and the inheriter of a noble name, I must make myself known in my native land. I must open a path to fame, either in the army or at court."

"And when you are gone," said my poor mother, "what will become of me?"

"You will hear with pride and pleasure of your son's success!"

"And should I hear of his death in battle?"

"Well; of what use is life at my age," I replied, "but to gain honour and glory? Think rather of the time when I shall return a colonel—perhaps a marshal of France."

"And then?"— said my mother.

"Why, then, honour and respect will follow my steps wherever I go."

"And then?"— pursued she.

"Then, I will marry my cousin Henrietta; we shall find noble husbands for my sisters; and we will all live together in peace and happiness in these ancient halls of my ancestors."

"And why not commence this life of happiness from this moment?" said my mother. "Where is there a wider or fairer domain in Brittany than yours? Who claims a nobler name in the province? In the midst of your faithful vassals, are you not sufficiently honoured and beloved? Leave us not, my son!—leave not your friends, your sisters, your aged mother, whom you may never again behold! Go not to waste, in the pursuit of vain glory, or to shorten, by sorrows and disappointments, those youthful days that pass so rapidly. Life is a treasure, my beloved Bernard; and where can you enjoy it more than under the lovely sky of Brittany?" As my mother spoke, she led me to a window, and pointed out the noble avenues of the ancient park, where the stately chestnuts were mingled with lilacs and woodbines, whose fragrant blossoms perfumed the air. Before the door stood the aged gardener and his family, whose saddened looks seemed to say, "Desert us not, our noble master—desert not those you are bound to protect!" Hortensia, my eldest sister, twined her arms round my neck, while Amelia, the youngest, taking up a volume of La Fontaine, pointed to an engraving, and with sobs placed the book in my hands. It was the fable of the *Two Pigeons*. I started up, and extricating myself from their embraces, again exclaimed, "I *must* win honour and glory!—let me go, let me go!"—and I rushed into the court-yard.

As I was about to ascend the carriage, a female figure appeared at the hall door. It was my cousin Henrietta. She wept not, spoke not; but, pale as marble, appeared sinking to the earth. She held a handkerchief in her hand, with which she waved me a last farewell, and then fell senseless. I rushed to her, raised her in my arms, and uttered the tenderest vows of love and constancy. But when I saw the colour revisit her cheek, leaving her to the anxious care of my mother and sisters, I hastened back to the carriage, without even turning my head. One look more at Henrietta, and I felt I could not have left her. In a few minutes after, the *chaise de poste* was rolling along the high road to Sedan.

Digitized by Google

For some time, my thoughts were entirely filled with my beloved Henrietta, my weeping sisters, my dear mother, and all the happiness I felt I was leaving. But as the ancient turrets of Roche Bernard receded from my view, these saddening images seemed to vanish also, and were succeeded by the brilliant visions of glory and ambition. What airy castles rose before me as I leaned back in the rumbling vehicle! Riches—honours—dignities—nothing did I refuse to myself as the just reward of my merit; and the scale ascending as I advanced on my journey, I was a duke, governor of a province, and Maréchal of France, by the time I reached the inn at which I was to repose for the night. The voice of my servant, simply addressing me as *Monsieur le Chevalier*, forced me, unwillingly, to abdicate my newly created dignity.

The next day, and for several succeeding ones, I indulged in the same intoxicating dreams, my journey being of some length. I was repairing to Sedan, to the residence of the Duke of C——, an old and tried friend of my father's, and the protector of the family. He had promised to take me to Paris, and introduce me at the court of Versailles. He hoped, also, to obtain for me a company in a regiment of dragoons, by the influence of his sister, the Marchioness of F——, a young and beautiful woman, whom public opinion pointed out as the probable successor of Madame de Pompadour.

I reached Sedan at so late an hour that I could not think of presenting myself at the ducal chateau, and therefore installed myself for the night at the *Arms of France*, the best inn the town afforded, and the rendezvous of all the officers of the garrison. Sedan was then a fortified town; the very streets had a warlike appearance, and the citizens a martial air, that seemed to say to a stranger, "We are compatriots of the great Turenne!"

I supped at a table-d'hôte, and took the opportunity of inquiring my way to the chateau, where I intended going in the morning.

"Any one will point it out to you," was the answer; "it is well known to the whole country. In that chateau expired one of our most celebrated men, and bravest of warriors, Maréchal Fabert."

And hereupon, as was natural amongst so many military heroes, the conversation fell upon the career of the maréchal. They spoke of his many gallant exploits, and of his singular modesty, which had made him refuse the titles of nobility, and the ribbons of several orders, offered to him by Louis XIV. Above all, they expatiated upon his extraordinary good fortune, which had enabled him, without the aid of family interest, he being the son of an obscure printer, to raise himself from a common soldier to the rank of Maréchal of France. It had appeared so extraordinary and unprecedented an elevation, that even during the life of Fabert, popular rumour had not been backward in attributing it to supernatural causes. It was currently reported that he dealt in magic, and it was even affirmed he had made a compact with Satan.

Our landlord, who, to the ignorance of a native of Champagne added the credulity of a peasant of Brittany, gravely assured us, that a few moments before Fabert expired, a black man, unknown to any one in the chateau, had entered the chamber and carried off the maréchal's soul, which, indeed, of right appertained to him, he having purchased it long before. Mine host also went on to state, that from that period to the present time, upon each anniversary of Fabert's death, the black man was seen at midnight bearing a lighted torch in his hand. This recital enlivened our dessert, and we quaffed several bumpers of champagne to the familiar demon of the deceased maréchal, hoping he might take us also under his protection, and give us similar triumphs to the battles of Collioure and Marfée.

The next morning, at an early hour, I repaired to the chateau of the Duke de C——. It was an immense and gloomy Gothic pile, which would not perhaps, at another time, have made much impression upon me, but I must confess that I now gazed upon it with a singular feeling of interest, as I called to mind the landlord's story.

The domestic who ushered me in told me his master was not yet visible. I gave my name, and was then left alone in an ancient hall, adorned with the trophies of the chase, and hung round with family portraits. I waited a considerable time, but no one appeared. "Is this brilliant career of glory to commence by the antechamber?" exclaimed I, beginning to conceive the impatience of a discontented place-hunter. I had gone three times the round of the grim portraits, and had sedulously counted all the beams in the lofty ceiling, when I heard a slight noise in the wainscot, and found it proceeded from a half-closed door, moved by the wind. I pushed it gently open, and saw a small room, tastefully furnished, and from which a glass door opened into a magnificent park. I advanced, in order to enjoy the view from the window, when another object met my sight. Stretched on a sofa, whose back was turned to the door by which I entered, was a man, who, not observing me, rose hastily and rushed to the window. I then perceived that his face was bathed in tears, and that despair was marked in every feature. He remained for a moment motionless, his face buried in his hands, then with rapid steps began to pace the apartment. As soon as his eye fell upon me, he stopped and shuddered, while I, distressed at my intrusion, muttered some words in apology, and was about to withdraw.

"Who are you?—what brings you here?" he exclaimed, in a loud voice, and seising my arm with violence.

"I am the Chevalier de Bernard, and I come"——

"I know, I know," he said, hastily; and taking my hand warmly, he made me sit down by him, and inquired with much interest about my family; spoke of my father, whom he appeared to have known so well, that I could not doubt my being in the presence of the master of the chateau.

"You are Monsieur de C——?" said I.

He rose, and replied, in an agitated tone, "I was once; but I am nothing—nothing now. Hush!—do not speak—do not ask me any questions!"

"Permit me, at least," I ventured to say, "to assure you, that if the most devoted friendship can in any way lighten the affliction of which I have been an involuntary witness"——

"You are right," he replied, abruptly; "though you cannot change my doom, yet you may receive my last wishes. That is the only service you can render me."

He closed the door carefully, and returned to his seat at my side, where I waited in trembling anxiety for the result. There was something awfully solemn in the tone of his voice, and an expression in his countenance I had never seen before. His face was deadly pale, while lightnings seemed to flash from his large dark eyes, and his features, worn by suffering, were frequently convulsed by a demoniac smile.

"What I am about to relate to you," he said at length, in a hollow tone, "will confound your reason. You will doubt—you will perhaps utterly disbelieve. Even I almost doubt at times still—at least I wish to do so; but the proof, the fatal proof, is too strong. Alas! are there not in all that surrounds us, in our very organisation itself, mysteries whose existence we are compelled to acknowledge without any powers of comprehending them?" He paused for a moment, as if to recollect his ideas, pressed his hand to his brow, and continued—

"In this castle I first drew breath; and being a younger son, upon the elder born was of course to devolve all the wealth and honours of our house, while I had nothing to look forward to but the cloak and band of an abbé. With a heart burning with ambition, and a head filled with dreams of glory, the prospect of this obscure lot made me wretched, and I resolved, by some means or other, to raise myself above it. Life was distasteful to me; I lived but in the future; and yet what a gloomy future appeared to my aching sight!

I thus attained my thirtieth year, and I was still nothing—nothing; while I daily heard of colossal reputations, whose fame reached even this remote province. 'I will try the career of letters!' I exclaimed; 'let me win fame in any way, for fame alone is happiness.'

The only confidant of my chagrin was an aged Negro, who had been in the chateau even before my birth. Indeed, he was so old, that no one remembered his coming; and it was said he had been present at the death of Maréchal Fabert."

Here an involuntary start of surprise, which I could not repress, made my companion pause. "Go on," I said, "'tis nothing;" but, notwithstanding, I thought of the black man described by the old landlord.

"One day," continued Monsieur de C——, "I gave way before Yago (so the old negro was called) to the despair of my soul, at the shameful obscurity in which I dragged on my days. 'I would give *ten years of my life*,' I exclaimed, 'to become a celebrated author!'

'Ten years,' said Yago, coldly; 'it is paying dear for such a trifle. However, I accept your offer. The ten years are mine. Keep your promise; you will find me true to my word.'

I will not attempt to depict my astonishment at this speech. However, after a moment's reflection, I naturally concluded that age had enfeebled his intellects; and with a smile of pity I left the room, and in a few days after the chateau. I arrived in Paris, and soon found myself in the most distinguished literary society of the metropolis. Encouraged by their approval, I published several works. My success exceeded my most flattering dreams. The journals of Paris, of France, of even foreign nations, rung with my name; yourself, even yesterday, young man, acknowledged the power of my genius."

"How!" I exclaimed, with astonishment; "you are not, then, the Duke of C——?"

"No," he replied, coldly.

"What favoured son of genius, then, stands before me?" said I:—"Marmontel! D'Alembert! Voltaire!"

The unknown, with a smile of contempt, continued his recital.

"The literary fame I enjoyed, unbounded as it was, could not satisfy a soul like mine. I longed for nobler triumphs, and could not help exclaiming to Yago, who had followed me to Paris, 'Oh, there is no real glory but that which is gained on the battle-field! What is a philosopher—a poet?—nothing! Speak to me of a *hero!* What are the poet's bays compared to the laurel wreath of a conqueror? To purchase that, I would willingly give ten years more of my life.'

'I agree to the bargain,' said Yago. 'They are mine also. Do not forget.'"

At this part of the narrative, the unknown paused, for he observed the astonishment expressed in my countenance.

"I told you," he said, "you would not believe. You think it a dream, as I, alas! did once. But the honours I won, the triumphs I gained—squadrons led to meet the fire of the enemy—fortresses carried by skill—standards seised by my bravery—victories that were echoed through the world: these were not dreams—no! that glory was real, and that glory was mine!"

He paced the room with rapid strides, and his cheeks flushed with the vehemence of his discourse, while I muttered to myself, "Who, then, is this renowned warrior?—Coigny?—Richelieu?—perhaps Maréchal Saxe himself."

The fever of enthusiasm passed away, and the unknown sunk again into despondency.

"Yago spoke truly," he continued, in a low and mournful tone. "I was soon wearied with the vain incense of military fame, and perceiving there was but one thing real and substantial in the world, I purchased, by five years more of my existence, the riches I coveted. Yes, young man, it is true, though incredible—I saw my wealth increase beyond my most sanguine desires. Lands, forests, castles, all were mine; even this morning I thought myself—but no matter; you will soon be convinced of the truth—oh, how soon!"

He approached the clock on the chimney, and looked at it with a terrified gaze, then continued, rapidly,

"This morning, on awaking at daybreak, I felt a degree of exhaustion throughout my whole frame that alarmed me. I rang my bell, and Yago answered the summons. 'What is the matter?' I exclaimed; 'I am faint.' 'It is but the course of nature,' he answered, calmly. 'Master, the hour approaches—it is come.' 'What hour!' I cried, in surprise.

'Do you not divine it?' said Yago. 'Heaven allotted as your portion sixty years of existence. You had lived thirty of them when I first became your slave.'

'Yago,' I cried, 'you are jesting with me!'

'No, master, no; in five years of life you have expended twenty-five to purchase glory. They became my property, and will be added to the term of my existence.'

'That, then,' I cried, 'was the price I paid for your services!'

'Others have paid dearer,' he answered, boldly; 'for instance, Fabert, whom I served also.'

''Tis false, 'tis false!' I exclaimed, vehemently.

'You will find it true, my master,' said the black; 'you have but half an hour to live.'

'Oh, say not so, Yago; you are deceiving me!'

'Calculate yourself,' he answered; 'thirty-five years that you have actually lived, and twenty-five lost. The account is square. It is my turn now; every one their own, is but justice.'

He turned to go, but feeling myself gradually sinking, I exclaimed in despair, 'Oh Yago, Yago! give me but a few hours more!'

'They would be deducted from mine,' said he; 'and I know the *value of life* better than you did. What treasure is equal to two hours of existence?'

A dark cloud seemed to pass before my eyes, and the chill of death was in my veins. With a last effort, I gasped out, 'Take back the wealth for which I have paid so dear. Give me but four hours more of life, and I resign my lands, my castles, my gold—all, all!'

'You have been a kind master,' said he, after a pause; 'I wish to do something in gratitude.' I felt my courage revive, and ventured to say, 'Four hours are almost nothing: Yago, Yago, grant me some more in addition, and I resign the literary fame that placed my name so high in the world!'

'Four hours of life for such a bagatelle as that!' said the negro, with disdain; 'but for *your* sake I will not refuse your last request.'

'Oh! say not my last,' said I, emboldened by his compliance; 'give me the twelve hours complete—one more day—and let the fame of my battles and victories be for ever effaced from the memory of mankind. One day, Yago—one day, and I am willing to resign all else.'

'You abuse my good nature,' he said; 'but I will not refuse. I give you till sunset. Farewell—with the last beam of day I come to fetch you'—And left me," continued the unknown, in the accents of despair; "and this is the last day I have to remain on earth." He rushed to the window, and pointed to the park. "I shall never again behold that lovely sky, that verdant lawn, that silvery stream, nor ever again breathe the balmy air of spring. Fool—fool that I was; the blessings that God lavishes upon all were mine also, and I despised them! Now I know their inestimable value; and I might have enjoyed them for twenty-five years longer; and in a few hours I must lose them for ever! I have squandered my life for a vain chimera—a sterile fame, that has perished even before myself. Look!" he cried, pointing to a group of peasants, who, on their return to labour, filled the air with their joyous songs; "what would I not give to share their labours and poverty! But I have nothing now to hope for—not even labour and poverty." A bright sunbeam at this moment fell upon his pale and distorted features; he grasped my arm convulsively, and exclaimed, "Look—look at that glorious sun; and I must leave it for ever! Ah! let me not lose a moment of this precious day, to which, for me, alas! there will be no morrow!" Thus saying, he rushed into the park, and disappeared amongst the foliage of a shady alley.

I threw myself upon the sofa, bewildered and oppressed by all I had heard and seen. Was it indeed a reality, or was I under the influence of some fantastic dream? The door was opened by a servant, who announced the Duke of C——.

A noble-looking personage, of about sixty years of age, entered, and cordially taking my hand, apologised for having detained me so long. "He had been compelled," he said, "to attend a consultation of the faculty upon the state of his unfortunate brother."

"He is not in danger, I trust?" said I.

"No," replied the duke, mournfully; "the disease is a mental one. From his youth he suffered the most extravagant ideas of glory and ambition to gain possession of his mind, till his frame, weakened by such violent emotions, was attacked by a fever in which his life was despaired of. He recovered, however; but his reason is, I fear, gone for ever. The unhappy illusion under which he labours is, that he has but one day more to live."

All was explained.

"Now, my young friend," continued the duke, "let us speak of your future prospects. Towards the end of the month I will be able to accompany you to court."

"I am fully sensible of your kindness, my lord," I replied; "but I have given up all idea of profiting by your generous offer."

"How is this?" exclaimed the duke, in unfeigned surprise: "give up the advantages that are almost within your grasp!"

"I resign them all, my lord."

"Young man," said the duke, "you know not what you do. Good Heavens! such a brilliant career open before you! In ten years"——

"Which would be ten years of my life lost," said I, with a smile.

"Lost!" cried the duke; "would it not be cheaply, buying glory, fortune, and honours? Come, come, you but jest; you will go with me to Versailles?"

"No, my lord," I replied, in a respectful but firm tone; "I will return to Brittany, where I will ever retain a grateful sense of your lordship's goodness and condescension."

"This is madness—downright madness!" muttered the duke, in a disappointed and angry tone.

"I feel it is sound reason," whispered I, as I thought of all I had heard and seen so lately.

The next morning I was on the road. Oh, with what inexpressible delight I beheld again the sweet sky of Brittany—the trees of my noble park—the turrets of my ancient castle! There I found my beloved mother, my sweet sisters, my faithful vassals; and there I found true happiness, which I have never since quitted. Eight days afterwards I was the husband of Henrietta.

MALTA, BY A TRAVELLER.

Since the establishment of the route by Egypt to India, the island of Malta has a prospect of again becoming a place of great importance, to merchants at least, and travellers. This revival of consequence is yet, to a considerable extent, in prospect; for the route in question is still attended with difficulties and disadvantages which prevent its general adoption. But it cuts off such an immense portion of the distance between Europe and the East, by rendering the circumnavigation of Africa unnecessary, that all obstacles must soon be removed, as far as man's ingenuity can remove them, and the adoption of the route become universal. Malta lies in such a position that it must rise in importance accordingly. The island is of great service, even now, to Europe, and Britain in particular. It lies half way between the plague and pestilences of the East, and the salubrity of the more fortunate West, and is used as a testing or purifying station, to secure the latter regions from the influx of the diseases peculiar to the former. No steamers from Smyrna, Athens, Constantinople, or any other port east of Malta, can pass the island without touching at it, and undergoing quarantine and purification in one of its harbours devoted to this purpose. Such an arrangement is obviously highly necessary, if not indispensable.

The steamers from England usually sail on the first of the month. They reach Gibraltar in ten days; the steamers from Gibraltar arrive at Malta in a little less than the same time; and the voyage between Malta and Alexandria occupies, also, between seven and ten days; so that a person from England may reach Alexandria in from twenty-seven to thirty days. Of course, the voyage backwards cannot be so quickly performed, as a quarantine of from ten to twenty days must be then undergone. There are, even at the present time, numerous steamers and other vessels to be usually found at Malta, both government and company property, English and French, Austrian, Tuscan, and Turkish; for even the pennant of the Ottomans is now to be seen flying from the mast of a "tchek-jeemie," as they call that noble product of man's ingenuity, the steam-boat.

Malta lies in the centre of the Mediterranean, holding much the same relation to Europe, Asia, and Africa, that the Isle of Man does to the three countries bordering St George's Channel. There was long a dispute whether it was in Europe or Africa, but the British parliament at last ended the matter by declaring it to be in Europe. Near to Malta is another small island called Gozo, which is generally included when speaking of Malta, as if it were a suburb of a large city. The extreme length of Malta is about sixteen miles, and the extreme breadth eleven; it has, however, a great many jutting points or capes, and is computed to contain one hundred and seventy square miles, upon which it is said there are one hundred and twenty-three thousand inhabitants, five thousand beasts of burden, six thousand horned cattle, eight thousand sheep, and twelve thousand goats; consequently it is one of the most densely populated places in the world. About one-half of the land is cultivated, and produces cotton and grain, with a plentiful supply of vegetables and fruit, and especially oranges, which are said to be the finest in the world. The annual value of the cotton raised is about one hundred thousand pounds, but the grain is not sufficient for even one-third of the inhabitants; consequently, there is a great trade carried on in grain from the Black Sea, which is admitted at a variable duty, averaging about a third of its wholesale cost in the island.

There is little or no other produce in Malta equal in any way to its capabilities, whether as regards the climate or population. It is true that there is a trade to a very limited extent in the manufacture and sale of cotton sail-cloth, napkins, table-cloths, shirts, cotton yarn spun by hand, gold and silver trinkets, iron-posted bedsteads, rush-bottomed chairs, and cigars; but labour is so cheap, and the amount of work done in any of these departments so small, that the people are not half employed.

The wages of workmen are small, but rent and living are remarkably cheap. Malta is undoubtedly the cheapest place in Europe; for there a working man can easily support himself and family on from 6d. to 8d. per day, and considers himself fortunate if he can make that sum regularly.

Besides villages, Malta has four towns, namely, Valetta, which is the capital, Floriana, Victoroso, and Civitta Vechia. Nothing strikes a stranger more on entering the capital, than the shelving nature of the streets, which ascend and descend in many parts by stairs. He will also be struck with the immense number of idle people hovering around him, and chattering in all the languages of Europe. The greater part of these are beggars, and the others candidates for the honour of being his guides, an office into which several will instal themselves, and then quarrel which of them has been employed. It is of no use that the first class are told that they will get nothing, and the second, that their services are not wanted; they will, with the most cool and pertinacious impudence, *trot along* (for in such cases they rarely walk) before, behind, and on every side of their victim; neither is it of any use to get angry at them, as, if they are scolded, they will throw up their hands and eyes with the air of ill-used people, and commence talking loud and long, proving to each other's satisfaction, and the torment of their victim, that they are deprived of their just rights. The only method of getting rid of them is to walk on, taking no notice of any one until the tail gets too large to be at all manageable, and then take refuge in a café, round the door of which they will probably hover for a few minutes, but soon depart to look after another stranger. If this course of silent non-recognition be followed, the cortège will daily diminish in number; and if the stranger has given none of them any money, then in about four days he will be left entirely without any escort, and in future be only troubled by the beggars. If, however, he has been so ill advised as to give away even a penny on his first coming to the island, his term of annoyance will be much increased, and his followers as plentiful as the serfs of a Celtic chief in the olden time.

The island is strongly fortified, and garrisoned by about 4000 men, nearly one-fourth of that number being native troops, under native officers. The capital is built upon a tongue of land which stretches out between the clean and quarantine harbours. The streets all run at right angles, whether on the plain or the hill. The city may be about half a mile long, and a sixth part broad: the shops are not numerous, and the greater portion of them are used as cafés, wine shops, and provision stores, in front of which, and in many cases stretching out to the centre of the street, the goods are piled in great quantities, as also fruit, vegetables, and all sorts of food, which are sold at very low prices. In summer, business is not transacted between 11 o'clock forenoon and 4 o'clock afternoon, on account of the great heat of the sun; during which cessation of labour, all the better part of the inhabitants are in their houses, and the mass of the common classes lying asleep on the shady side of the street, or under a doorway, wherever they can escape from the sun.

There are many public buildings in Malta deserving of notice, especially the Palace of the ancient Grand Masters, and the Chapel of the knightly order of St John. There is also a most splendid library, which belonged to the knights, in existence at the present day, beautifully arranged, and well catalogued by the native librarian, who appears to understand his business as well as if he had been brought up in Paternoster Row. There is likewise a large library of modern books called "the Garrison Library," in the same building. This library receives from England all new works of interest, the greater part of the leading periodicals, and several newspapers. The regulations are exceedingly liberal, as a stranger coming to Malta with a letter of introduction to any respectable person, would find no difficulty in having the free use of all contained in both libraries.

About half a mile from Valetta stands Floriana, which contains a few streets of rather a miserable order. In an opposite direction is situated Victoroso, where the Admiralty offices and stores are all placed, and where the different officers connected with this department have elegant houses bordering upon the sea. The town is very dirty, and consists for the most part of streets of steep stairs ascending to the battlements, where, if the sun is shining, thousands of lizards may be seen sporting themselves in its rays, emerging from the crevices, and concealing themselves again with the speed almost of lightning. Civitta Vechia is distant from Valetta about five miles. It is the ancient capital of the island, and the oldest city in it, but, on account of the better situation of Valetta for defence and commerce, has lost its rank and importance.

During the hot season of the year, the island has the appearance of a dried-up lime-kiln; but there is no doubt, from the show in the markets, that there is verdure upon it; yet we can safely aver that during a residence of some little time, we scarcely ever saw as much of it on the grounds as would cover a man's hand.

The boatmen of Malta are a most troublesome set of fellows, as, if the traveller walks along any part of the town which leads to the shore, he is certain to be assailed by a number of them, all insisting on the employment of one boat in preference to another; and even although they are told that a boat is not wanted at all, still they will follow until they conduct the stranger along the shore beyond the boat station. The number of these men exceeds three thousand, and they possess about eleven hundred boats. The usual fare from any one place in the island to another, or to any vessel in the harbour, is 2d., but these rascals insist sometimes upon strangers giving them a *dollar*; even a bargain is never held sacred, as, when the work is finished, they are sure to insist on double or three times the stipulated sum. The only way to manage them is to throw the money down on the street, and walk away; it is true they will follow their *fare* half way over the town; but the thing is so common, that nobody takes any notice of a stranger followed by one or two Maltese boatmen, calling out for money alleged to be due for service performed.

The language of the Maltese is of a very strange character, being a mixture of the Arabic and Italian, but containing most of the former. Nearly all the people, however, can speak a little bad Italian, but very few of the lower or middle classes understand any English, saving a few words of every-day occurrence. The habits and manners of the people are also a mixture of the rude Moorish and smooth Italian. Altogether, they may be said to be one of the most disagreeable and roguish races of people on earth. Of honesty or fair dealing they have no idea, and nothing is too small for them to seize upon and carry off. Even their smallest coin, which is the twelfth part of a penny, will not be disregarded if there is a means of obtaining it, without an adequate return being given. Throughout the Levant they have a notoriously bad name, and at Alexandria and Constantinople are proverbial for their robberies, and even murders, thereby causing the British consuls at these places ten times more trouble than all the other subjects of the British empire.

The females of Malta are celebrated for their large black eyes, but in other respects they have not the beauty of either the Spanish or Italian dames. The dress of the lowest class is slovenly and dirty; that of the middle class is neat, and generally white within doors in summer; but on the street the white gown is covered with a black silk skirt, while a black silk scarf, called *falletta*, is thrown over the head and shoulders, and disposed in such a manner as to show the countenance of the wearer in the most favourable semi-nudity, and is nothing more than a western garment worn in an eastern fashion. The upper class of females in Malta are rarely to be seen on the street; they, however, dress like the English and French, after the latest European fashions.

From the number of priests and friars who crowd the streets, one might easily tell, even if the conduct of the inhabitants did not proclaim it, that Malta is a place where the church is all-powerful. But, however much the diffusion of knowledge may have extended to other places, certainly the schoolmaster has not been here, for old and young are living in the most complete ignorance. Education is entirely in the hands of the priests, who have the exclusive management of the College, or School of Instruction, and it is practically of little use to the people. The women receive no education at all. Few of the men can read, and none of them can write, excepting those who may be said to gain their bread by the pen.

The press, as may well be supposed, is in a very poor state indeed, where the people are so sunk in ignorance; but it will hardly be credited that it is so low as it really is. Until within eighteen months, there was no printing-press permitted in the island but that of the government, from which issued a small newspaper, once a-week, under the name of the "Malta Gazette." It appeared in parallel columns, English and Italian, but contained no original political articles—being made up of extracts from the London, Paris, and other newspapers of an old date; and yet, though this was the only channel in Malta of receiving news of what was passing in the world, previous to the granting the liberty of the press, it never had a circulation of more than three hundred.

Since the press has become free, there have been started two Italian newspapers in Valetta, one of them entitled "Portofoglio Maltese," and the other

Digitized by Google

"Il Spettatore Imparziale," but there is nothing in their columns worthy of special notice. A third newspaper, in English and Italian, has also been started, under the name of "Il Gazetto del Mediterrano." It is decidedly the most clever that has ever appeared in Malta, but, it is to be feared, will sink for want of support. The Maltese care for almost nothing beyond the day or hour in which they live; a newspaper is of no interest or use to them; and until they are better educated, or some great change takes place among them, the liberty of the press will not be either valued or supported.

A FEW WEEKS FROM HOME.

VENTILATION AND LIGHTING OF THE HOUSES OF PARLIAMENT.

Most persons, I suppose, have heard that within the last two or three years various schemes have been proposed for the proper ventilation and lighting of the Houses of Lords and Commons, and that those which have been most approved of are now in operation. Except, however, from a random newspaper paragraph, little has been made known respecting the successful plans, and it is probable that some little account of them from personal observation may not prove unacceptable.

During my stay in London, I had occasion to call upon Dr D. B. Reid, of Edinburgh, who has been appointed to organise and superintend the ventilation of the Houses, and was by him kindly conducted over the establishment, and introduced to Mr Goldsworthy Gurney, the able discoverer and applier of the new process of lighting.

Ventilation has hitherto been little understood or thought of. We scarcely find a church, school, or ball-room, or public or private structure of any kind, properly ventilated. The most splendid structures are occasionally seen in course of erection, without the smallest provision for the escape of the vitiated air, and the admission of that which is pure and wholesome. Ignorance has stumbled on one mode only of relieving the overloaded air of crowded apartments, and that is by opening the windows—a practice of the most dangerous kind as respects health, and which on that account, independently of its clumsiness, should not be resorted to except in cases of extreme necessity.

It is impossible to have any accurate idea of the principle of ventilation, unless we become familiar with the fact of air being a buoyant fluid, which has a tendency to keep up an equilibrium in all parts of its volume—that is, if you exhaust a vessel or room partially of its air, the air without will have a tendency to rush in to supply the deficiency. Another thing to be remembered is, that warm air is more expanded and lighter than cold air, therefore it rises while the cold sinks. Observe how these principles act in the case of opening windows on a cold day. The cold air rushes in to fill up the deficiency caused by the expansion, and sinks to the floor, while the hot air rises, or is retarded and cooled. The rush of cold air in such a case, may prove most fatal to an overheated person. If the day be as warm outside as in the house, the opening of the windows is of no use for the escape of the hot air; there will be no rush either way; hence, by the common method of ventilation, there is no means of withdrawing the vitiated atmosphere from a church or large assembly-room in warm weather. To ventilate properly, it is indispensable that the balance of the atmosphere should be disturbed by artificial means; and the means which the air naturally adopts to rectify its want of equilibrium, forms the ventilation. Perhaps it is not generally known that a room, whose door is kept shut, endeavours to ventilate itself by the chimney. During the day, when the sun is powerful, the air in the apartment expands and lightens, the redundancy going off by the chimney; when night comes, the air in the room condenses or goes into a smaller bulk, and, to supply the deficiency, there is a rush of air down the chimney; and thus there is a see-saw motion of air up and down the chimney daily. The sea and land breezes of tropical islands are accounted for on precisely the same principle.

Dr Reid has for many years been known as a skilled scientific ventilator. His chemistry lecture-room is one of the most curious things which can be seen. Various fires are seen in stands in different parts of the floor, but instead of poisoning the apartment with nauseous fumes, the smoke of each is seen to rush down a tube, as if anxious to be gone and out of sight with all imaginable speed. The secret of this urgent haste is, that the smoke is rushing towards some larger fire elsewhere, or hastening to supply the demand for air. The doctor has carried this principle into beautiful operation in the Houses of Parliament. I shall first describe his operations in reference to the House of Lords.

Beneath the house there is a series of low vaults, paved with stone, and connected by passages with similar vaults beneath the House of Commons. One of the vaults, on the western side of the building, is that in which Guy Fawkes was discovered when about to blow up the edifice with gunpowder, and it is here that Dr Reid now performs the first part of his process of introducing and purifying the air. On one side of the vault is a wide opening, covered with coarse gauze, through which the air penetrates, depositing in its course any particles of soot or dust with which it may be loaded. Having passed into the vaulted apartment, it is completely washed with water as it rushes across to the passage beyond. The washing apparatus consists of a number of pipes laid longitudinally and transversely on the floor; each pipe is perforated with a great number of holes, and from these spout jets d'eau in all directions, so as to really fill the apartment with an intense spray, and effectually wash the air as it proceeds through it. On the inner side of the vault, the air is as fresh and pleasant as at the brink of a waterfall. Being thus purified, the air, if necessary, is made to pass through a vaulted chamber, containing a congeries of pipes of hot water; and being there warmed, is sent on by a channel or passage to the House. The temperature of the air which is admitted can be at all times regulated with perfect nicety, by allowing it to go, more or less, through the warming-room; and for the purpose of discovering at any time what is the degree of heat their lordships above are enjoying, a thermometer is pulled down by a string from a concealed part of the house.

The air, thus regulated in temperature, is admitted into the house through canvass which covers the walls, and also behind the bar, seats, and tables. The canvass, which is stretched upon the walls, or rather at a little distance from them, is of a thin yellowish description, and is streaked or marked to resemble oak panels. As high up as the heads of the members, the canvass is papered in a neat style. When the air admitted in this manner all round the house, through the texture of the canvass walls, has been breathed and vitiated, it passes off through ventilators in the roof into a kind of garret, whence it proceeds along a passage, and descends a shaft to the ground. On going round by a stair to the bottom of this very strange air channel, we find ourselves in a vestibule opening upon an immense ash-pit, into which we perceive red hot cinders occasionally falling. We step forward, and enter the ash-pit. We now find ourselves standing at the bottom of a round chimney, measuring a hundred feet high, and eleven feet broad at the base, and in which, at the height of some twelve or fifteen feet overhead, we observe a large blazing fire suspended on a capacious grating. There is no opening into the chimney except from the vestibule, into which all the vitiated atmosphere of the House is poured—the fire being trimmed only by means of a small door on the outside, but which is usually kept shut—and therefore this forms the great organ of draught in this extensive ventilating apparatus.

We now come to the House of Commons. The air is admitted for it through gauze into a lower vault, in the same manner as for the Lords; passes, if required, through a heating room; and is thence conducted in a purified state to a space beneath the floor. For its admission, the floor and rising steps are penetrated with millions of small holes, and rising in these, it passes through a coarse carpeting into the House. Having there performed its office, the air passes off by openings round the edges of the panels in the ceiling, into a garret above, where it is led away by a passage to the descending channel to the ash-pit and fire which I have already described, and which answers for both Houses. I was conducted by the doctor up a trap-stair to the dark passage leading from the garret, at a time when the House was sitting, for the purpose of observing the effects of the draught created by the fire. Groping along the passage, we reach a door which rises and falls like a sash-window. This is an important part of the apparatus. At the time I visited the spot, it was open about a foot at top, and through this there poured a steady current of air in our faces from the openings into the garret. I was told by the doctor not on any account to move down the sash, for it would add a power to the draught whose least effect would be to blow away our hats into the dismal gulf behind us. Both, therefore, by this shifting sash-door, and by means of the doors beneath in the vaults, the quantity of air admitted or sent through the House can be exactly regulated, so as to create no unpleasant sensation to the members. In ordinary circumstances, there is an opening for a current of 60 cubic feet of air, which rushes at a velocity of 10 feet per second; 60 multiplied by 10 makes 600 feet per second, and this again multiplied by 60 seconds, gives 36,000—that is, thirty-six thousand cubic feet of fresh air supplied every minute for the consumption of the House. The air, likewise, can be admitted in either a cold or warm, moist or dry state, at a moment's notice. On one occasion, seventy gallons of water were sent in in the shape of moist air in the course of a few hours. The feelings of the members being very various, the regulation of these details, as may be supposed, is a matter of extreme delicacy. The great object desirable by the learned doctor, is to afford at all times a profuse supply of the best air for breathing, without any sensible feeling of draught to the members; and this he seems to have admirably accomplished by his ingenious arrangements for both Houses. It has been alleged, that the method of admitting the air through the carpet on the floor has the effect of raising a dust in the apartment; but such is not the case. Every precaution is taken to avoid this, not only by the universal porosity, but by the plans adopted for brushing the feet of the members as they pass along the passages and lobbies. It is further necessary to observe, that the plans, at the best, are only preparatory to others of a more perfect kind in connexion with the new Houses of Parliament now in course of erection, and for the superintendence of which, our friend the doctor is now necessarily resident on the spot.

Having offered an idea of the mode of ventilating, I now proceed to a subject not less remarkable for the great scientific skill which is displayed upon it—the method of supplying artificial light to the House of Commons. During the day, light is admitted through sloping glass ceilings on each side; and at night the light is derived chiefly from two large lustres pendant from that central panelled part of the roof, through which the used air has been described as escaping. Externally, there appears nothing worthy of notice in the lustres, except the peculiar intensity of the light, which in each case is emitted from a single burner, and it is to the nature of this that the attention of the reader has in a particular manner to be directed.

The light employed is the invention of Mr Goldsworthy Gurney, and is called the "Bude Light," from the name of his residence in Cornwall, where it first became known to him. In 1823, Mr Gurney published a work on the elements of chemical science, in which he described the powerful light produced from lime by the action of the mixed gases. This light, about seven years afterwards, was employed by Lieutenant Drummond on the Trigonometrical Survey of Ireland, in consequence of which it took the name of the "Drummond Light." A committee of the House of Commons on Light-houses, in 1834, recommended the lime light to be experimented on, with a view to remove the practical difficulties connected with the subject, and adapting it for light-house illumination. In consequence of Mr Gurney having first announced the discovery of the light, he was recommended by the committee to the Trinity House, to carry out the experiment. In the course of his engagement in this office, he discovered the present light, which he considered better for light-house purposes, and, as already mentioned, called the Bude Light. This light is produced by introducing oxygen gas in the interior of the flame of a lamp. An ordinary flame is hollow, the exterior part being only ignited by the atmosphere; the interior part is unburnt, containing the vapour of oil and carburetted hydrogen, and the burning of this unused interior vapour as quickly as it is distilled, by the admission of oxygen, forms the principle of the Bude Light. As soon as a small tube, conveying a stream of oxygen, is introduced into the heart of the flame, the light is immediately increased in its intensity. Since this valuable discovery was made, Mr Gurney has effected various alterations and improvements on the light. Formerly he used oil, but now he employs common street gas. This gas, however, is made to pass through a box containing naphtha, which naphthalises it, or improves its inflammable properties, and renders it equal to the best oil without the trouble of wicks. The London street gas, it is necessary to explain, is an impure stuff, containing a certain proportion of free hydrogen, which combines with the carbon of the naphtha, and forms a bi-carburetted gas as it passes. The Edinburgh gas being pure, or without free hydrogen, would not require any such assistance from naphtha. The apparatus for supplying the oxygen is placed in a vault adjacent to Dr Reid's ventilating process. It consists of two iron retorts built over a furnace, and in these is put a certain quantity of oxide of manganese (a metallic substance which resembles brayed coal in appearance), from which oxygen is evolved, and led away in pipes to a gasometer; from the gasometer small pipes proceed to the burners in the House, each conducting a stream of oxygen into the heart of the flame. The light so produced is most intense in brilliancy, but is softened by the intervention of ground glass, and illuminates, with a powerful effect, the whole interior of the apartment. A more perfect substitute, in every respect, for daylight, could not, I believe, be found. The flame being supplied freely with oxygen, a comparatively small quantity of atmospheric air is abstracted or consumed, and all offensive heated air from the combustion is carried away in a small tube into Dr Reid's ventilating gallery above. Before the introduction of this beautiful light, the House of Commons was illuminated with 240 wax candles dispersed about in different parts—a method of lighting which Sir David Brewster has described "as most absurd, and such as no person at all acquainted with the physiological action of light on the retina, and the principles of its distribution, could have adopted."* Dr Ure, on being examined by the committee of members respecting the power of the Bude Light, previous to the substitution of gas for oil, observed—"I made experiments upon it very carefully in my own house last night, and compared its relative illuminative powers with argand lamps and candles with great pains, both by the method of shadows and also by Mr Wheatstone's photometer. Mr Gurney's larger Bude lamp, furnished with a wick of five-eighths of an inch, but emitting a white flame of only three-eighths in diameter, was found to afford thirty times more light than a wax candle, and nearly three times more light than the standard flame of the mechanical lamp, which was equal to from ten to eleven candles. Secondly, Mr Gurney's smaller Bude burner, with a flame one-quarter of an inch, was found, by the same methods, to afford a light eighteen to twenty times greater than a wax candle."

The adoption of the Bude Light in the House of Commons, as now improved and simplified by the substitution of gas for oil, has completely set at rest all theoretic speculations on the subject. The light is not only by far the most brilliant, without distress to

* Report of Committee on Lighting the House.

Digitized by Google

the eye, but is cheaper by two-thirds than the old wax-candle plan of illumination. If I recollect properly, Mr Gurney told me that the expense of using the Bude Light, in which naphtha is required, is about twelve times greater than that of common London gas, sizes of flame being equal, but that as the Bude flame gave twelve times more light, the expense was in reality the same, without the inconvenience of many burners, and a great consumption of air. The property of giving little heat, in comparison to what is produced by common gas, is in itself of great importance. Another useful property is, that the light may be varied in tone, from the most perfect white down to the red ray, by increasing or diminishing the quantity of oxygen.

It would be needless for me to say any thing further of this singularly ingenious means of artificial lighting, which cannot fail to prove extensively useful for light-houses on the coast, theatres, and other large places of assemblage, not to speak of its being rendered available for private dwellings. Gas companies, I should think, could find no difficulty in supplying pipes of oxygen to their customers, along with their usual service of carburetted hydrogen. There have been much worse speculations.

MESSRS CHAMBERS'S SOIRÉE.

[In the 269th number of the Journal, published on the 13th July last year, an account was transcribed from the *Edinburgh Weekly Chronicle* newspaper, of a temperate social entertainment which had been recently given by the publishers of this work to the working people employed by them. On that occasion it was explained that our sole object in giving extended publicity to the description, was to induce other employers in distant parts of the kingdom to give similar entertainments, not only as in themselves right and proper things, seeing that they tended to keep the various parts of society in harmony, but as means of promoting a good understanding directly between the entertainers and entertained. For similar reasons, we now reprint from the *Scotsman* of July 8th an account of the entertainment of this year, adding an abstract of a speech which we esteem as one of the most important of the evening, but which, from unimportant circumstances, was only alluded to in the report.]

The annual soirée given by the Messrs Chambers to the numerous persons in their employment, together with their wives and families, took place on Monday last in one of the large halls in their printing-office, High Street. Although the occasion was strictly private, it yet presented many features entitling it to public notice. The admirable sentiments delivered, the sound principle evolved, and the good and kindly feeling manifested as subsisting between the employer and the employed, must have been extremely gratifying to all present, and furnish an example worthy of being imitated in similar large establishments. As on former occasions, the large room was decorated with flowers and evergreens, and laid out with tables capable of accommodating 160 persons. The company assembled at six o'clock, and, shortly afterwards, Mr William Chambers took the chair, supported on the right by Lord Murray and the Rev. Mr Shannon; and on the left by Lord Cuninghame, Mr Simpson, the Rev. Mr Bennie, Dr Murray, &c. Mr Robert Chambers acted as croupier, surrounded by a select number of friends, including Mr Frederick Hill, Inspector of Prisons for Scotland; his brother Mr Arthur Hill, of the Bruce-Castle Academy; Mr Hugo Reid; and Mr Andrew Bell, editor of Playfair's Euclid. After tea and coffee had been served,

Mr W. Chambers rose, and was received with loud cheering. He commenced by stating the object of the entertainment to be the associating together in one harmonious party, and without distinction as to rank, the two classes of persons—employers and employed. Addressing the latter, he said it afforded him great pleasure to welcome them once more to a simple entertainment such as that now presented, and to thank them, in his brother's name and his own, for the attention, the sobriety, and integrity which they had individually manifested during the past twelve months. He held it to be of immense importance to the cause of general philanthropy, and to the comfort and peace of society, that there should be assemblages of this innocent and cheering nature, and hoped that the example now set would be followed in other establishments, where too frequently, from a bad understanding of each other's feelings, there prevailed the most distressing animosities, if not the most violent strife (cheers). It had been said that *benevolence was power*, and to the truth of this he could well testify; in fact, benevolence was wealth, peace, and happiness (cheers). It was most gratifying for him to state that, by their united exertions—that is, masters and men together, and there were now about a hundred of them—they were pouring forth such a stream of sound healthful instruction over the land, as must in time, he hoped, produce some fruits worthy of notice and remembrance. He was glad to say that all the works with which their name was associated were at present highly prosperous. The Journal, the first started of its class of cheap publications, on the 4th of February 1832, or about two months before the Penny Magazine, had never sunk a single copy in circulation, but had risen progressively to 72,000 copies weekly, and was now the widest circulated literary print in the British islands or the world. Of this work, and of the Educational Course, and People's Editions, that is, three distinct publications which they conducted, there were printed last year five millions of sheets, and of the Educational Course and People's Editions there appeared to be now a settled sale of 100,000 volumes each annually. It was agreeable to reflect, that in this large mass of original and selected literature, there was nothing of a vicious or demoralising tendency. Convinced that if mankind be debarred from the enjoyment of innocent and enlivening recreation, they will seek for that which is of an opposite quality, it had ever been a leading object with his brother and himself to provide such matter as would improve, while it entertained the minds of their readers; and it was exceedingly gratifying to think that their efforts in this respect had been extensively imitated and followed up by other labourers in the same field of literature. Mr Chambers next adverted, in as delicate a manner as possible, to the attempt making by Mr Sergeant Talfourd to hamper, if not altogether destroy, the issuing of expired copyright works at a cheap price; but cheap literature, he felt convinced, would continue to thrive and be countenanced both by rich and poor. Human improvement was not thus to be checked by a small legislative effort. (cheers.) The press was now the mightiest engine in the country, and would increase in dignity and power with the increasing civilisation of the age (cheers). "I turn, however," said Mr Chambers, "from these speculations to a subject more intimately connected with our present meeting. Deeply engaged in furnishing the materials of publication, and involved in a thousand considerations which require constant vigilance, my brother and I are anxious to lay aside business for one evening, and to meet you here in a genial fraternity of feeling; to express our satisfaction with your conduct, and the observance you give to the rules which we have thought proper to institute for the general comfort. We are all labourers in the same cause. One labours by an exercise of the reflective faculties, another labours by the exercise of the hands and arms. Thus we are all labourers or workers in one way or other. Besides labouring by the thoughts, we venture our capital, that is, we buy materials on which your industry and skill are to be exercised. For your sobriety, your honesty, and your skilled industry in the situations which you respectively fill, my brother and I give our applause and our thanks. It is our earnest desire to make your lot agreeable, as far as lies in our power. Pressed upon all sides by competition, or, in other words, by the necessity for manufacturing our goods as cheaply as those of others, or at such prices as will command a ready sale, we in each case give as high wages as the trade sanctions, and as we can afford, and with which we believe you are satisfied. At any rate, we are the advocates, in the fullest sense of the term, for freedom of trade—freedom to go, and freedom to come, and that for the benefit of all. Thus left at liberty, some of you by force of circumstances, or by your own abilities, may rise to occupy a higher sphere: but, remember, every condition of life has its own sources of inquietude. The labours of the operative terminate at fixed hours, and he has nothing to think of but his stated task. The master has, in addition to all his labours, a never-ceasing anxiety. For ourselves, I may say that our toils are ceaseless and exhausting. My brother and I are in the condition of the unhappy juggler, who, after every performance, must rack his brains to show off some new trick, otherwise he will lose his audiences. Yet we are not without a gleam of sunshine in our path. We are repaid by the smiling countenances and happy hearts of those around us. It *is* something to have good servants, and to live in harmony with them. Not the least object we have in view in calling you together to the present entertainment, is to show our friends that masters and men *can* live together in peace, and that they can also meet in social concord, without leading to disorganisation or to encroachments on each other's privileges. I am glad to think that we have been this evening honoured with the presence of individuals who, from their station and character, will be able to carry an account of our happy and innocent meeting into sections of society in which the working classes are too often looked upon with distrust. Perhaps, also, our example may be copied by other employers and employed. Perhaps it will be found possible, as in the present instance, to have social enjoyment without abasement of the senses in intoxicating liquors. If we can in any way accomplish even this, we shall set a most valuable example to our fellow-creatures."

Mr Forsyth, foreman of the compositors, replied in an able and appropriate speech. He said—"Mr Chairman and Mr Croupier—After the lapse of a year, it has once more become my pleasing duty to tender you our united acknowledgments, as well for this your annual festival as for your kindness and courtesy during the past year. In doing so, it might be thought unnecessary that I should do any thing more than merely refer to your general conduct towards us, the individuals in your employment; but, while we would proffer you our warmest thanks for the many kindnesses received, we consider that there is another and more important subject which this meeting is calculated to suggest. We are all labourers in one great cause, and, however humble the occupation of many of us, that cause raises and dignifies our employment. Our gratitude as your workmen, then, reminds us more forcibly of the fact that all our labours have a common end and purpose—namely, the enlightenment and elevation of the great body of the people. Gentlemen—We believe this to be a great and a good cause. We believe, that if ever the title of philanthropist was properly applied, it is when given to those who have been the active agents in opening up new intellectual sources of pleasure in the minds of their fellow-men—who have fostered the love of virtue and the practice of all good—and caused the seeds of knowledge to spring up in otherwise sterile soils. To you, gentlemen, belongs this high honour. The whole course of your career has borne testimony that other motives than those of mere men of business have actuated you in your labours. We believe that to elevate the condition of working-men, by unfolding to them the manifold beauties of knowledge and virtue—the true sources of content and happiness—has ever been one of the grand objects of your exertions. In proof of the fact, it is unnecessary to go beyond your own establishment, and more especially the present meeting; if it were, we could refer to your pecuniary sacrifices for the furtherance of praiseworthy objects, and the formation of libraries for working-men in different parts of the country. What Washington Irving beautifully said of Roscoe, may be far more appropriately applied to you—that 'he opened up pure fountains, where the labouring man may turn aside from the dust and heat of the day, and drink of the living streams of knowledge.'

The system of cheap literature which you have originated, promises soon to revolutionise the entire business of bookselling. Already have some of the most influential London publishers successfully imitated the 'People's Editions;' and it appears not unlikely that, in the course of time, few reprints will be published in any other form. By this means, those copyright works which were formerly found only on the shelves of the wealthy, are now fast descending from their lofty abodes to amuse and instruct the poorest of the community. One would suppose that the good induced by this state of things was so clear and self-evident, that no one would be bold enough to deny it. Nevertheless, we find those who see nothing to admire in it; the idea of the 'vulgar many' (the 'swinish multitude' is the orthodox phrase, but it is now somewhat old-fashioned) reading and understanding such works as Butler and Paley, is utterly beyond the sphere of their thoughts. That working-men should read or think at all, seems to these persons altogether unnecessary. One grand characteristic of the age—the universal thirsting after knowledge—is to them a theme only of censure or regret." [Mr Forsyth then discussed in sarcastic terms a diatribe against popular knowledge which lately appeared in one of the London magazines. We omit this part of the address, excepting one passage, which vindicates the Journal from an imputation of mere surmise, which we have seen in other quarters.] "Other statements of this writer are still more extravagant than those now noticed. His definition of 'useful knowledge' is 'the knowledge of locomotive engines and railroads, &c., and any thing pertaining to the cultivation of the heart or conduct,' he says, 'it would be regarded as an insult to introduce.' I think it but proper that the Messrs Chambers, and their fellow-labourers, should be defended from these ridiculous insinuations. I make bold to say, that there is hardly a man or woman—ay, boy or girl—in the country, but who knows their falsehood and injustice. To refine and instruct all classes, and inspire every man with reverence for all the great duties of life—at the same time that he is made to comprehend the improvements of the advanced and advancing civilisation of the times—have unquestionably been the general objects of all cheap literature, and in particular of the publications of the Messrs Chambers. I believe there is scarcely a workman in the kingdom but whose mind and heart have both experienced the benefits of such publications. * * Before concluding, allow us to hope that this meeting will be a pledge and earnest of a future good understanding between us. That nothing may occur to interrupt the harmony which has hitherto subsisted, is our sincerest wish as it is our truest interest. If our good wishes for your prosperity can avail aught, you have them heartily and sincerely."

Mr Forsyth, before sitting down, read an address with which he had been intrusted by the bookbinders of the establishment. This document, after alluding to several arrangements which had been made for the convenience of its authors—mentioning, in particular, the practice of paying weekly wages on Fridays, and allowing the men to cease working on Saturdays at 3 o'clock afternoon, by which all temptation to break the Sabbath was removed—concluded as follows:—"These evidences of your zeal to promote our interests morally and intellectually, have had the effect, we hope, of making us studious of your interests and active in your service; and so it will be found in every establishment where there is a happy and contented body of workmen—more is accomplished, and in a more efficient manner, than can be expected under different circumstances. In conclusion, let us assure you, that all your kindnesses will only prompt us to greater exertions, and with willing hearts and ready hands we shall go on from day to day in those earnest endeavours for your service, which, we trust, have been already evinced; and shall hereby receive the happy approval of our own consciences, and rejoice in the knowledge that we have done our duty."

Mr Chambers then took an opportunity of adverting to the services of several individuals in their employment, to whom they were in a particular manner indebted; and to that person who had the entire charge of this large house and all its valuable property, Mr Dickson, he now begged to present a writing-desk, in testimony of his esteem and gratitude.

Mr Dickson returned thanks.

Mr Simpson rose, and was enthusiastically received. He said there were discoveries in the moral as well as in the physical world. It was a moral discovery that benevolence is power. It was not the less a discovery in relation to human *practice*, that the fact is stated in Scripture, for there it has been too little heeded. The present meeting had further discovered that intoxication is not essential to mirth and conviviality; that they may be jovial, *royal*, nay, as *glorious* as Tam o' Shanter himself, on lemonade. John Barleycorn was giving place to John Coffeebean (laughter). It was another moral discovery that healths, sentiments, toasts, as they are called, might be given by us without our forthwith swallowing poison; and that it is a monstrous absurdity that, by the very symbolic act of wishing health to another, we should destroy our own (cheers and laughter). "On the strength of this discovery, I claim," said Mr S., "your cheers—ay

——— 'the thrice repeated cry
That oft has cheer'd the wine cup and the fight,
And bid each arm be strong, and bid each heart be light.'

But *here* is neither the wine cup nor the fight, though where the one is, the other often follows (a laugh); yet we may receive with an acclaim quite as lively this cordial wish—"Permanence and extension to a good understanding and kindly co-operation between employers and employed." This much-to-be-wished state of things is actually attained here. This meeting is its sign. It is no vulgar feast; it is really a feast of reason, of temperance, of courtesy, of refinement. The ladies are present (cheers). Wives and sisters cannot join a *drinking bout*—a debauch. Their presence humanises, *gentlemanises* the rougher sex. A still more beautiful feature is before

Digitized by Google

us—children are here—even *babies* are brought by their confiding mothers (loud cheers), and conduct themselves with that propriety which befits this excellent establishment (laughter). One *honourable member*, from the sound of his voice somewhere about the ripe age of six months, has repeatedly cheered, and always in right places (laughter); *he* cordially approves of the principle and spirit of this meeting.

A meeting like this involves and evolves deep principles. It proves the practical value of the maxim that benevolence is power. The control which the Messrs Chambers exercise in their great establishment, is the unresisted, because irresistible, control of justice and kindness. Throughout the year all is peace and good-will in the works, and here annually masters and men meet to renew their truly Christian, as well as commercially wise, compact, and part with hearts yet warmer, and resolutions yet firmer, for another trial (loud applause). Another principle made manifest here is the practicability, demonstrated by the result, of elevating the character of the working man, or rather of his elevating his own; and in his practical exhibition of improved intellect and morals, of his taking rank where these qualities should and must place him—among gentlemen. All that is worthy, really gentlemanlike, in the classes above him, will meet and hail him more than half way. Why do the higher classes shrink from contact with the humbler, as these yet too generally are? The reason is obvious; they cannot meet in fellowship with drunkenness, filth, coarseness, and brutality. That they will hold out a cordial right hand to real respectability, let this meeting, and the distinguished men around me who grace it, tell. One other principle evolved by a meeting like this, I will mention. All this respectability—all this moral elevation—all this intellectual and moral rank—all this fitness for fellowship with the true aristocracy—for these qualities constitute the only real aristocracy in its essential character—is consistent with the duties and regulated toils of labour. It is with working men we are at this interesting moment in company—men who do a fair honest day's work; and who have daily proof of that farther moral discovery, that labour is neither an evil nor a degradation, except in its excess, for then it is both. Regulated labour is a divine dispensation—a blessing—for 'it is by the blessing of God that man goeth forth to his labour until the evening.' The same authority says, 'All things are full of labour.' The Creator has given us a faculty for labour, the exercise of which is delightful to us; and he has at the same time arranged material creation, so that labour is necessary to turn it to our advantage. This, too, calls forth our energies. 'Man,' says Channing, 'would have been a poor creature, had nature yielded him every thing spontaneously.' See the schoolboy escaping from his hitherto repulsive books, and begging admittance to the carpenter's shop—happy if allowed to handle his tools. How many *gentlemen* are voluntary workmen!—how many men of rank! The late Lord Traquair was an enthusiastic cutler, and was delighted if you brought him a pair of old razors to put in order (laughter). Lord Douglas was a bookbinder. Crowned heads not less were labourers. George III. was a turner; Leopold of Austria a clock-maker; and Louis XVI. a lock-maker. Our muscles, our health, require labour; for exercise is labour. We must all labour—with head if not with hands; and my two distinguished friends near me (Lords Murray and Cuninghame), who laboured at the bar, and now labour on the bench, must ride or walk, or work with their hands, to preserve their health. Labour, moreover, is no degradation. It is a gothic absurdity to look upon it in that light. A high degree of intellectual and moral worth—a high refinement of character—is compatible with manual labour. Such a labourer, spite his hard and horny hands, is fit company for the first gentlemen in the land. Let us not forget that St Paul laboured with his hands. Channing is right when he talks of the *dignity* of labour. The real degradation is sloth and idleness. It is to this that the friends of that education which forms and elevates character would bring the working man. We are called visionaries, theorists, by the education obstructors of the old school. Let them look at our *practice*. Would that certain prelates were here; and would honestly say whether they have ever produced, or can produce, a scene like this. Nay, more, I would invite them to follow these men to their homes—see their happy families, their books, their domestic amusements, their quiet religious duties, their general respectability, prudence, and usefulness—and compare such a base for the pyramid of social order and safety, with that which an ignorant and brutal mob has long presented to the despairing philanthropist (cheers). We who desire to see an universal system *of such* instruction, can say to our obstructors, 'These are our fruits, where are yours? Shall we find them in religious contentions, hatred, and intolerance?—in empty churches, and full jails, hospitals, and workhouses?—in pauperism and pestilence?—in that mass of ignorance and cruelty, vice and crime, which poisons the passing gale in our cities, and pollutes the moral atmosphere of our land? Will you bring these fruits of your husbandry—rather these rank weeds of your neglect—and, placing them on a rival altar, hope that God will have respect unto your offering!' (loud cheers). Turn we from such a contemplation again to the scene before us, and when we reflect on the vast extent of good that flows from the labours of these very workmen—on the triumph of steam-press and stereotype which they all lead a cheerful hand to achieve—on their twenty-four thousand sheets every day of the year—one thousand every hour—which go forth like a thousand wings, bearing healing abroad, and scattering it over the world—well may we repeat the sentiment with which I set out, and couple it with 'health and prosperity to the Messrs Chambers and their workmen.'" The sentiment was received with loud and long continued applause.

The chairman proposed the healths of Lord Murray and Lord Cuninghame. Received with great applause.

Lord Murray returned thanks.—He felt great pleasure on being present at a meeting composed chiefly of working men. On being asked once by a friend from the Continent what was most worthy of observation in this country, he had directed his attention to the industry, and intelligence, and firmness of purpose, displayed by our working population (cheers). Get into conversation with our operatives at the loom, or our labourers at the plough, and you will discover in them an extent of information, a power of reasoning, and force of character, which I am proud to think you will not find, to the same extent, in any other country in Europe. I quite agree with what has been so eloquently stated and so well reasoned by my learned friend near me (Mr Simpson), as to the necessity for every one to labour. In this respect the rich are often the most unfortunate (hear). Look at a man with five or six thousand a-year. He cannot sit down on his estate to vegetate like one of his own trees, or to be watered and manured like one of his farmers' turnips (laughter). No; he must find employment, and accordingly he meets a number of other gentlemen who have as little to do as himself, and gets upon a horse's back, often in cold frosty mornings, at four, five, or six o'clock, to run after some unfortunate fox who has no choice in the matter (laughter). He then gallops over hedges and ditches, and exposes himself to broken legs or other accidents, thus performing an amount of labour which would be considered a severe sentence to be pronounced on any one in a court of justice, and all because he has the misfortune to have nothing to do, and is obliged to seek out work for himself (cheers and laughter). His lordship then alluded to yachting as another practice resorted to by the rich from the same cause. The Italian nobleman, he continued, is in a still more unfortunate position. He has none of these manly sports to give employment to his leisure hours, and healthful exercise to his body, but wastes his time in looking at his paintings, or building and altering his palaces, and is surrounded by a set of people all as miserable as himself (cheers). His lordship concluded by proposing, as a sentiment, "Freedom of conscience," which he begged leave to couple with the name of the Rev. Mr Bennie. The sentiment was received amid loud cheers.

Mr Bennie rose to reply, and was received with loud applause. After some preliminary observations, and an eloquent vindication of liberty, civil and religious, which, he said, should be universally prevalent, with the exception of such restraint as wisdom places on bad men, the reverend gentleman proceeded to address himself to the sentiment which had been proposed. Freedom of conscience, particularly in religious matters, is the right of every individual. Persecution, which springs from the spirit of selfishness, has been too prevalent in the world; and he rejoiced that men were becoming more alive to the true dignity and majesty of their nature. Using a bold and striking image, Mr Bennie spoke of men "persecuted into fame and chased up to heaven! No man has a right to dictate what I shall believe, or how I shall interpret this or that passage of Scripture; and he who accepts his opinions from another is a miserable slave." We regret that we have not room to give even an outline of the reverend gentleman's eloquent speech, which was concluded amid loud and long-continued cheering.

Mr Simpson said there were two brothers present who were employed in a sphere of usefulness not less important than that of the two who presided on this occasion—he alluded to Mr Frederick and Mr Arthur Hill. The exertions of the former in reforming the discipline in our prisons were well known, while the latter was at the head of one of the most important educational seminaries in the country. Mr S. then referred to the splendid triumph of Mr Rowland Hill, their brother, in reforming the post-office, and concluded by proposing their health, which was hailed with all the honours.

Mr F. Hill replied in an interesting speech. He had at least the merit of disinterestedness in attending the present meeting, as the Messrs Chambers were employed in striking the ground from under his own feet (laughter). He then referred to the interest which he had often seen prisoners take in reading their Journal, and related instances in which they had expressed that interest, and hoped that it might be the means of preventing others from falling into crime (hear, hear). With respect to his brother, Mr Rowland Hill, he said that his plan for cheapening the postage had been long discussed in the family, and, although they were all convinced of its practicability, the author of the scheme had yet been utterly hopeless of its ever being carried into effect. The rapid progress which the question had made on its being first brought forward, ought to be an encouragement to all who may have similar projects in view for benefiting society, but who may despair of ever seeing them realised (loud cheers). Mr Hill said he perfectly agreed with the sentiments which had been so eloquently expressed that evening respecting the importance of labour, and related various anecdotes to show how much it was valued by the prisoners under the improved system of prison discipline which had been introduced. One boy confined in jail, having obtained permission to work as long as he pleased, had sat up all night. In Glasgow, a lady had asked permission to visit the prisoners in the Bridewell, and on being shown through a number of the cells, where criminals were at work, she repeated her request that she might be allowed to see some of the *prisoners*. On being told that she had already seen them, she expressed her surprise. She thought she had been shown some part of the establishment used as a factory, and could hardly credit the statement that the individuals she had seen so actively, and seemingly happily, at work were persons undergoing punishment. In the Glasgow Bridewell an experiment had been introduced which he hoped would be productive of much good. After performing a certain amount of work, the prisoners were allowed to work on their own account. The articles thus produced were fairly valued, and the prisoners credited with the amount. In order, too, to give them some idea of savings' banks, the money thus acquired was laid out at interest. Habits of industry were in this way formed, and a small stock collected which enabled them to clothe themselves respectably on leaving the prison, and gave them a chance of recovering their position in society (cheers). He feared he had detained them too long on a subject so deeply interesting to himself, and concluded by again thanking them, in the name of his brothers and himself, for the manner in which their humble labours had been noticed.

In the course of the evening a plentiful repast of strawberries and cream was served up to the company, and several excellent songs were sung by Mrs Bushe, who was present as a guest, and others. Mr Spindler's band was in attendance, and at intervals regaled the company with some admirable instrumental music. Excellent addresses were also delivered by Lord Cuninghame and Dr Murray, and the meeting broke up about half-past eleven o'clock, highly delighted with the manner in which the evening had been passed.

A MARRIED MAN'S REVERIE.

BY JOHN INMAN, AN AMERICAN AUTHOR.

What a blockhead my brother Tom is, not to marry! or rather, perhaps, I should say, what a blockhead not to marry some twenty-five years ago, for I suppose he'd hardly get any decent sort of a body to take him as old as he is now. Poor fellow! what a forlorn desolate kind of a life he leads; no wife to take care of him—no children to love him—no domestic enjoyment—nothing snug and comfortable in his arrangements at home—nice sociable dinners—pleasant faces at breakfast. By the way, what the deuce is the reason *my* breakfast does not come up? I've been waiting for it this half hour. Oh, I forgot; my wife sent the cook to market to get some trash or other for Dick's cold. She coddles that boy to death. But, after all, I ought not to find fault with Tom for not getting a wife, for he has lent me a good deal of money that came quite convenient, and I suppose my young ones will have all he's worth when he dies, poor fellow! They'll want it, I'm afraid; for although my business does very well, this housekeeping eats up the profits with such a large family as mine. Let me see; how many mouths have I to feed every day? There's my wife and her two sisters—that's three; and the four boys—seven; and Lucy, and Sarah, and Jane, and Louisa, four more—eleven; then there's the cook and the housemaid, and the boy—fourteen; and the woman that comes every day to wash and do odd jobs about the house—fifteen; then there's the nursery-maid—sixteen; surely there must be another—I'm sure I made it out seventeen when I was reckoning up last Sunday morning at church; there must be another somewhere; let me see again; wife, wife's sisters, boys, girls—oh, it's myself! Faith, I have so many to think of and provide for, that I forget myself half the time. Yes, that makes it—seventeen. Seventeen people to feed every day is no joke! and, some how or other, they all have most furious appetites; but then, bless their hearts, it's pleasant to see them eat. What a havoc they do make with the buck-wheat cakes of a morning, to be sure! Now, poor Tom knows nothing of all this. There he lives all alone by himself in a boarding-house, with nobody near him that cares a brass farthing whether he lives or dies. No affectionate wife to nurse him and coddle him up when he's sick; no little prattlers about him to keep him in a good humour—no dawning intellects, whose developement he can amuse himself with watching day after day—nobody to study his wishes, and keep all his comforts ready. Confound it, hasn't that woman got back from the market yet? I feel remarkably hungry. I don't mind the boys being coddled and messed if my wife likes it, but there's no joke in having the breakfast kept back for an hour. Oh, by the way, I must remember to buy all those things for the children to-day. Christmas is close at hand, and my wife has made out a list of the presents she means to put in their stockings. More expense—and their school-bills coming in too; I remember before I was married I used to think what a delight it would be to educate the young rogues myself; but a man with a large family has no time for that sort of amusement. I wonder how old my young Tom is; let me see, when does his birthday come?—next month, as I'm a Christian; and then he will be fourteen. Boys of fourteen consider themselves all but men now-a-days, and Tom is quite of that mind, I see. Nothing will suit his exquisite feet but Wellington boots, at thirty shillings a-pair; and his mother has been throwing out hints for some time as to the propriety of getting a watch for him—gold, of course. Silver was quite good enough for me when I was half a score years older than he is, but times are awfully changed since my younger days. Then, I believe, the young villain has learned to play billiards; and three or four times lately, when he has come in late at night, his clothes seemed to be strongly perfumed with cigar smoke. Heigho! fathers have many troubles, and I can't help thinking sometimes that old bachelors are not such wonderful fools after all. They go to their pillows at night with no cares on their minds to keep them awake; and, when they have once got asleep, nothing comes to disturb their repose—nothing short of the house being on fire can reach their peaceful condition. No getting up in the cold to walk up and down the room for an hour or two with a squalling young varlet, as my luck has been for the last five or six weeks. It's an astonishing thing to perceive what a passion our little Louisa exhibits for crying; so sure as the clock strikes three, she begins, and there's no getting her quiet again until she has fairly exhausted the strength of her lungs with good straightforward

Digitized by Google

screaming. I can't for the life of me understand why the young villains don't get through all their squalling and roaring in the day-time, when I am out of the way. Then, again, what a delightful pleasure it is to be routed out of one's first nap, and sent off post-haste for the doctor, as I was on Monday night, when my wife thought Sarah had got the croup, and frightened me half out of my wits with her lamentations and fidgets. By the way, there's the doctor's bill to be paid soon; his collector always pays me a visit just before Christmas. Brother Tom has no doctors to fee, and that certainly is a great comfort. Bless my soul, how the time slips away! Past nine o'clock, and no breakfast yet; wife messing with Dick, and getting the three girls and their two brothers ready for school. Nobody thinks of me, starving here all this time. What the plague has become of my newspaper, I wonder?—that young rascal Tom has carried it off, I dare say, to read in the school, when he ought to be poring over his books. He's a great torment, that boy. But no matter; there's a great deal of pleasure in married life, and if some vexations and troubles do come with its delights, grumbling won't take them away; nevertheless, brother Tom, I'm not very certain but that you have done quite as wisely as I, after all.—*From a newspaper; original place of publication unknown.*

FLOWERS.

Plants may be multiplied in many ways, by budding, grafting, inarching, by layers, pipings, and cuttings, by suckers, the division of roots and tubers, and by seed; and there are very few species from which by some of these methods an increase cannot be obtained. So easy, indeed, is the multiplication of plants, and so large a number of new plants can, with proper management, be raised from one original stock in the course of a year, that the nursery gardeners find it impossible (excepting in rare instances) to maintain a high price for a new flower beyond two or three years: the first year the price of a new flower may be L.5, the second it will be about 30s., the third year not more than 2s. 6d. The method applicable to the greatest number of plants, and which is successful with ordinary management, is that of cuttings: from the parent plant small slips or cuttings are taken where the wood is not very tender, and, if practicable, at a joint. The cuttings should be planted about two inches apart, in large pots or boxes, and the pots placed in a moderately warm hot-bed, shaded from the sun. In about a fortnight they will strike root, and begin to grow. They should then be gradually hardened, be put as far as practicable into separate pots, and removed into the flue-pit, where plenty of air must be given them in the day-time to prevent their damping off, and a fire be lit before frosty nights; the additional security of mats, thrown over the frames, must be used when the weather is unusually severe. The time of removing the plants from their winter quarter, must depend upon their nature, and the climate in which they are to grow. The last week in May, or the first in June, is the earliest time at which the tenderest will bear a thorough exposure; for one or two previous weeks they should be hardened by gradual exposure to the wind and cold nights, care being taken to protect them with mats if either should be in excess. The cultivation of dahlias is commenced in the second or third week in February, when the roots which have been taken up in the autumn should be put into a hot-bed, kept, as far as practicable, at a uniform heat of 62 degrees to 65 degrees; a little of the earth in the bed should be spread over them, and water liberally given them once a-day. The roots will then push out suckers, one from each eye; these should be separated from the bulb; a few fibres of the old root being torn off with them, and being treated after the manner of cuttings, will strike and be ready to plant out at the end of May. It is a fault with gardeners, generally, that their dahlias flower too late. The first flowers are seldom perfect, and it often happens that the plants have not long reached their prime before they are either pinched by cold nights, or perhaps altogether destroyed by frost. It is, therefore, desirable that the plants should never be checked in the early stages by want of heat or otherwise. Perennial herbaceous plants may be easily multiplied by dividing the roots either in the autumn or in spring. Annuals are principally raised from seed sown in April and May, either upon a hot-bed, from which they must be transplanted, or in the situation in which they are to grow. Sweet peas and mignonette, nemophylla insignis, poppies, &c. are very shy of being transplanted, unless from pots. Mallows, choriopsis, China and German asters, French and African marigolds, eutoca viscida, nolana prostrata, &c. will be better raised on a hot-bed. New annuals are continually produced: we do not, however, consider them generally as a desirable class of flowers. There are two methods of arranging flowers with a view to their display—1st, putting each species in a separate bed; 2d, mixing two or more species in one bed. Each has its merits, and in every garden both should be practised. When flower-beds situated close to each other are to be filled with one species only, it will be requisite to consider the height and colour of the flowers to be planted, that both symmetry and harmony may be preserved. Yellow flowers, especially among those that grow from six inches to two feet in height, are more numerous than flowers of any one other colour, and care must be taken not to plant them in undue proportion. When several species are to be planted in the same bed, the largest bed must be chosen, the tallest species be placed in the middle, and various colours mixed together; sufficient space should be left for each plant to grow freely, without interfering with or confusing its branches with those that are next to it. Flowers for the most part like a rich, light, new soil. The spot chosen for a flower-garden should be dry, open to the sun, and sheltered from wind and cold.—*Penny Cyclopædia.*

TORONTO.

Toronto, though exhibiting little to bear out its pretensions either as a city or a capital, and still less to justify the metropolitan airs which the *élite* of its denizens assume, is a place bearing (unlike Kingston) the appearance of having been much improved within these last few years; but it as yet possesses only one good street, which runs east and west, and this is in some parts advantageously set off with an array of well-filled shops and stores. At the western extremity of such street, on opposite sides of the road, stands a sort of overgrown party-coloured cottage, dignified by the name of "Government House," and a neat assemblage of red brick buildings, comprising the schoolhouse and private dwellings appertaining to "Upper Canada College," of whose history I shall hereafter speak. Between the Government House and the bay, an unseemly mass of brickwork, encasing the legislative chambers and various of the public offices, rears its head; while, a mile beyond this again, is an ill-constructed stockade sort of fort, with an incommodious barrack within its circuit. Eastward, Toronto's chief edifices are a church, a bank, a town hall (having behind it a market place), and, lastly, a sessions house and jail, besides a second prison house in progress of construction, to signify the moral improvement of the people. This end of the town is much eschewed as vulgar by the high order of patricians; whose abodes, consisting in many cases of good-sized, substantial, though isolated houses, are for the most part situated in the three opposite directions. Of these, the Yongestreet Road, running north, is decidedly the most eligible locality; and a few miles out it exhibits some very pretty scenery. Nevertheless, the *city* of Toronto will not bear mentioning in the same breath with either of the American *towns* Rochester or Buffalo (both, I believe, of later origin), though I am aware that, in making this assertion, I incur the risk of being thought tasteless, not to say a rebel in disguise, by the majority of those amongst whom I have been so lately dwelling; since they would consider as derogating from their city's dignity the mere institution of any comparison. Speaking generally, however, of contrasts between Canadian and American objects indicative of relative progressive improvement, I lament to add my humble testimony to that of many other visiters to both countries, that the comparison is immeasurably in favour of the states; and the fact is rendered strikingly apparent to the unbiassed observer, not simply by his passing through the states on his way to Canada, but by his residing in the latter country for a lengthened period, then traversing the neighbouring states, and afterwards returning to the British territory.—*Preston's Visit to Canada.*

ANECDOTES OF ALLIGATORS.

The following singular fact in natural history, appears in a work called "Recollections of a Three Years' Service in Colombia, by an officer of the Colombian Navy:"—"There were hundreds of my old acquaintances, the alligators, who were usually to be seen lying on the top of the water with their mouths wide open, ever and anon closing them with a horrible crash upon some luckless fish, which the force of the current had conveyed into them. In the course of the voyage, I had an opportunity of ascertaining a fact concerning these creatures, which I do not recollect to have observed in the natural history of them. The Indians told me that, previously to their going in search of prey, they always swallow a stone, that, by the additional weight of it, they may be enabled to dive with the greater celerity, and drag whatever they may seize under the water with them with ease. They have been frequently known, on this river, where they are exceedingly large and rapacious, to draw men and horses out of sight. Not giving implicit credit to this statement of the Indians, I determined to ascertain if it were true, and mentioned my intention to his excellency, who assured me the Indians were correct; and for the sake of amusement, consented to shoot some to convince me. The only parts where they are vulnerable to musket-shot are on the dirty white part of the skin along the chest and abdomen, and in a space of about three inches in breadth behind each ear. The former can seldom be aimed at, and we therefore tried at the latter. Bolivar, whose aim was certain, shot at and killed several with a rifle, in all of which, when opened, were found stones varying in weight according to the size of the animal. The largest killed was about seventeen feet in length, and had within him a stone weighing about sixty or seventy pounds. The Indians, whose occupation obliged them to be always on the river, or close to its banks, said that they have frequently observed the young ones, in the morning, swallowing small stones at the side, under the shelter of the wood, before they searched for their victims, and depositing them at night in a place of safety."

AN IRISH ELECTION IN FORMER DAYS.

In the goodly days I speak of, a country contest was a very different thing indeed from the tame and insipid farce that now passes under that name. In the times I refer to, the voters were some thousands in number, and the adverse parties took the field, far less dependent for success upon previous pledge or promise made them, than upon the actual stratagem of the day. Each went forth, like a general to battle, surrounded by a numerous and well-chosen staff; one party of friends, acting as commissariat, attended to the victualling of the voters, that they obtained a due, or rather undue, allowance of liquor, and came properly drunk to the poll; others again broke into skirmishing parties, and scattered over the country, cut off the enemy's supplies, breaking down their post-chaises, upsetting their jaunting cars, stealing their poll-books, and kidnapping their agents. Then there were secret service people bribing the enemy, and enticing them to desert; and, lastly, there was a species of sapper and miner force, who invented false documents, denied the identity of the opposite party's people, and, when hard pushed, provided persons who took bribes from the enemy, and gave evidence afterwards on a petition. Amid all these encounters of wit and ingenuity, the personal friends of the candidate formed a species of rifle brigade, picking out the enemy's officers, and doing sore damage to their tactics, by shooting a proposer, or wounding a seconder—a considerable portion of every leading agent's fee being intended as compensation for the duels he might, could, would, should, or ought to fight, during the election. Such, in brief, was a contest in the olden time; and when it is taken into consideration that it usually lasted a fortnight or three weeks, that a considerable military force was always engaged (for our Irish law permits this), and which, when nothing pressing was doing, was regularly assailed by both parties—that far more dependence was placed in a bludgeon than a pistol—and that the man who registered a vote without a cracked pate was regarded as a kind of natural phenomenon—some faint idea may be formed how much such a scene must have contributed to the peace of the country, and the happiness and welfare of all concerned in it.—*Dublin University Magazine.*

VERSES

Written by a Father on a beloved Daughter, Helen—familiarly called by him "Elly Pye"—who died 23d May 1839.

I saw her in her infant day,
Whilst on a mother's lap she lay;
Her smile was heaven—her opening eye
Reflected deep the azure sky;
A happy, happy father I,
For oh! how sweet my "Elly Pye."

I saw her in her girlhood sporting,
To glen and woodland oft resorting;
The flowers to cull, the notes to hear
Of scoty blackbird, whistling near,
To chase the wavering butterfly,
With nimble foot—my "Elly Pye."

I saw her in her teens array'd;
Not now a girl—not yet a maid;
A girlish form, a maiden mind—
The all but woman, all refined.
Such once the form that met mine eye,
And such the soul of "Elly Pye."

I saw her in her twentieth year,
Accomplish'd, lovely, and sincere;
A full-blown rose in bower of bliss—
A father's hope, his paradise;
My heart was light when she was by—
My dear, bewitching "Elly Pye."

Her years had number'd twenty-one;
Her bloom was fled—her spirits gone—
Her eye was sunken, *sadly clear*—
And dull was now her startled ear;
Her *hope* was with her God on high,
Her *heart* was mine—my "Elly Pye."

"The hour of my departure's come,
I hear the voice that calls me home;
I leave the world without a tear,
Save for the friends I hold so dear,"
She whisper'd low, with deadening eye,
And *kissed*, and *died*—my "Elly Pye."

I saw her breathe her latest breath,
(And, oh! how beautiful in death!)
The passions still—the combat o'er—
And pain and sorrow *now* no more.
I could not weep, I could not sigh,
But groan'd aloud, "My Elly Pye."

I saw the coffin borne along,
Amidst the motley, griefless throng;
I thought my heart would burst in twain—
I scarce can feel the like again,
Till in the grave I come to lie,
With my own darling "Elly Pye."

One year has pass'd, and still my heart
Feels all its love and all its smart;
There's not a glen, a wood, or wild,
That has not seen me weep my child—
That has not heard my wailing cry,
"Oh, where is now my Elly Pye!"

One year, one circling little year,
Has pass'd, yet Helen still is dear—
Dear as when last she blest my love,
And talked of meeting yet above;
Yes, we shall meet again on high,
My early-sainted "Elly Pye."

St Andrews. T. G.

RECIPE FOR PREVENTING SEA SICKNESS.

Notwithstanding the sea had lulled, it blew a stiff breeze still, and the Crusader rolled and tossed upon the huge toppling waves of the Atlantic in such a way that I was again sick; but, having some little experience of what genuine sea sickness really is since crossing the Bay of Biscay, I managed to avoid much of the unpleasantness I then suffered, principally by the following means, which I would strongly recommend to all landsmen. If you feel sickish, or know by experience that you will be sick, go to bed, close your eyes, and remain lying on your back, if possible, without motion; abstain from food, but not altogether; I would rather say, eat sparingly, and of some solid, such as a little broiled meat, or biscuit, as I have known most alarming effects arise from "total abstinence," to say nothing of the violent straining and fruitless retching it occasions. Drink sparingly of cold water, or brandy and water in sips, but taste no hot liquid of any kind. In keeping the eyes shut, I would remark, that the effect of vision and its sympathy with the stomach are not enough attended to; for though at rest in the berth, the swinging backwards and forwards, and motion of the vessel and things around, are often sufficient to produce what we wish to avoid. There is, however, one point at which emesis becomes inevitable—it is when the mouth fills with saliva, and then the sooner it takes place the better.—*Wilde's Narrative.*

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with titlepages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 446. SATURDAY, AUGUST 15, 1840. PRICE THREE HALFPENCE.

THE ANGEL OF PATIENCE.

In a former age of the world, while as yet it was judged necessary that heaven should communicate its wisdom directly to man, an angel was intrusted with the duty of imparting lessons in patience.

A great lord lay upon silken cushions in a splendid apartment, surrounded by every luxury which his own and neighbouring countries could produce, and waited on by troops of menials who were ready to obey his most slightly expressed wish. But, amidst all his enjoyments, the great lord writhed in mental anguish. The king had that afternoon passed him without notice; and the want of one word from the royal lips had been sufficient to produce a complete insensibility to all the other blessings of life, of which he possessed such abundance. "Was there ever any mortal so miserable as I am!" he bitterly exclaimed; and next minute, when his butler presented him with a cup of the most delicious wine, he started up in a paroxysm of anger, and threw the liquor in the man's face, merely because he observed a speck of dust upon the salver on which the cup was borne.

He had no sooner been left alone, than the Angel of Patience stood before him, and, holding up a mirror, desired him to look in it. He coldly raised his eyes, and, looking in the mirror, beheld a vessel struggling with a tempest, while the merchant, its proprietor, was directing the sailors to throw bales of rich merchandise overboard, in order to save it from destruction. "Great lord," said the angel, "behold this scene. It is one really taking place at this moment. An honest and industrious merchant has committed all he possesses in the world to this vessel, with the hope of turning it to profit; but he has been overtaken by a storm, and now, for the sake of bare life, he is compelled to sacrifice all that property which was the result of so many years of toil, and upon which he calculated for the means of spending his latter days in peace, and portioning his sons and daughters. Is he not more miserable than thou?"

The great lord held his peace, and, after a brief pause, the angel desired him to look again. The whole of the merchandise had now been thrown from the vessel, and the merchant showed by his attitude and looks, that he was resigned to the great loss which it had been the will of Heaven that he should experience. "Seest thou," said the angel, "how patient the merchant is! He knows that he is pennyless, and must once more begin the world, if he would wish again to be wealthy, or even to acquire the means of subsistence. Yet he breathes not a word of complaint. He submits to fate, and his soul is at peace." "Oh, angel," said the great lord, "I see all that thou showest to me, and am corrected. May I never again repine about trifles, or fall into such unworthy fits of anger!" The angel then departed, for her purpose had been accomplished.

Bakrak sat in his magnificent bazaar in the city of Betlis, which was filled with all the rich spices, and cloths, and porcelain of the east. He was the richest man in the city, and fortune still continued to flow upon him in an unremitting stream. But at this moment a cloud sat on the brow of Bakrak. One of his slaves had that day disappeared with a package of the rich shawls of Lahore, and, as misfortunes rarely come single, his coffee had not been scorched exactly to the right degree of dryness, so that it wanted much of its usual flavour. He was in such an angry mood, that not one of his remaining servants durst approach him. His favourite son, young Bakrak, whom he rarely saw without loading with caresses, had gone up to him as he was accustomed to do, and laid his head affectionately on his shoulder; when, instead of patting the child as usual on the cheek, he had given him a box on the ear, which caused the blood to flow from his mouth. At that moment, the Angel of Patience suddenly entered the gorgeous bazaar.

Holding up her mirror before Bakrak, she desired him to look therein. He complied with a sulky carelessness, but was soon arrested by the sight which met his eyes. It was one of those beautiful vales which one can never see without supposing them to have been designed for the habitation of innocent and happy human beings. The full moon had risen over the centre of the vale, and was looking mildly down into it, as if it had been a divine thing created for the use of that valley alone, and which would remain to be admired and worshipped there for ever. But a band of lawless men had this evening entered the valley, and were now engaged in plundering the inhabitants. The picture delineated in the mirror more particularly displayed in the foreground a cottage in flames, while the family that lately occupied it sat bound with cords on the sward in front, surrounded by a small party of the depredators. Then the scene was slightly changed. The children, five in number, were commanded to mount behind as many troopers, in order to be carried away from their native country, the girls to be sold, at prices proportioned to their beauty, in some distant slave-market, and the boys to be brought up as recruits for the army of the sultan, and neither ever again to see their parents. Bakrak saw the struggles and tears of the father and mother, as their children were borne away, and, thinking of young Bakrak, he groaned aloud. "This," said the angel, "is a real scene, which is at this moment passing in a certain part of the world. What are all your troubles to the misery of this desolate pair? Behold, and be thou restored to equanimity." "I am restored," said Bakrak; and the angel left him.

An artisan had returned from his daily toil to the tranquil home, where, though no luxury ever appeared, there was at least a sufficiency of necessaries, and even of comforts. His wife smiled on him as he entered, and his children ran to embrace his knees, and offer the kiss which was as much homage as affection. But the heart of the artisan was heavy within him, and he looked round on his neat household, and the clean and healthful meal prepared for him, with dissatisfaction. He had been torturing himself all day with reflections on his incessant labours, and the apparently superior happiness of others, and he had at length arrived at the conclusion, that the class to which he belonged were treated by the wealthy only as slaves, born to minister to their pleasures. His wife and children shrunk from his cold eye and gloomy brow, and the evening passed in silence and sadness. At length, no longer able to bear the agony of his thoughts in the presence of his family, he walked out into his garden, which he paced for some time with hurried steps, as if seeking to escape from some demon which tormented him. At this moment, the Angel of Patience presented herself, and held up her mirror before his eyes.

He saw a man and woman, who, from their dress, seemed to belong to a country different from his own. They were poor wanderers, who sought a livelihood by selling little articles amongst the country people; and their attire bespoke a general condition little above that of common mendicants. It was Saturday evening, and they timidly approached a small farmhouse, in order to ask shelter for the night, and during the ensuing day.* The farmer beheld them with suspicion, but said they might, if they chose, take up their abode in an outhouse to which he pointed. The two foreigners thanked him humbly, and went to the shed which he had pointed out. They found it to have only part of a roof, and to contain no furniture of any kind, but they were forced to be content with it. The man, who wanted one of his arms, immediately proceeded to the neighbouring field, and with his one hand cut as much dry grass and rushes as served to make up a bed in the only corner of the shed where there was a roof. They then partook of some wretched fragments of bread and meat which they carried with them, and lay down to rest, but not till they had, according to the forms of their country's religion, rendered thanks and praise to the Giver of all good for such share of his bounty as they enjoyed. The mirror further showed the life of this humble pair during the next day. Early in the morning, the man made arrangements in their little habitation for performing a religious ceremony, which in his own country he had been taught to regard as all-important, though, in that where he now was, it was considered as an abomination. At the proper time, he performed this rite with his wife as his sole fellow-worshipper, both taking care that no one else should be annoyed by what they did. "Behold," said the angel, "how two of the poorest and most wretched of human beings deport themselves towards God and man, while thou, who enjoyest so many more blessings, tormentest thyself with vain imaginings. Thou canst read the lesson: I ask if thou art corrected!" "I am," answered the artisan; and the angel left him.

An old man, who made a slender livelihood by the labours of himself and an aged horse, was one day passing along the road, leading that animal, which was loaded on this occasion with a burden much too heavy for its strength. The dress of the old man was ragged, bespeaking the utmost poverty; but his cheek showed still some red, and he set his foot to the ground in such a manner that no one could suppose him to be in a very feeble condition. To testify his vigour still farther, he thrashed his horse in a most unmerciful manner with a whip which he carried in his right hand, tugging the bridle at the same time with his left, as if he would have pulled the head of the poor animal away from its body. Occasionally, he kicked its stiff sides, which gave forth a sound such as a basket gives when kicked, and he was continually showering upon the animal opprobrious nicknames and furious execrations. He was impatient to reach a particular place with his load, because he was to have no pay and no breakfast till his task was accomplished. It was partly his hunger which made him on this occasion use his horse so cruelly. Unexpectedly, the Angel of Patience came up and walked along by his side. "Pitiless man," said she, "how canst thou thus treat the very creature that is doing its best to serve you? Hold still thy wicked hand, and take even from that animal a lesson of patience. You have loaded it beyond its strength, and yet it endeavours to do what you demand of it. You kick and lash it, and it bears all with submission. The misery of that poor animal is at this moment extreme; I know it to be so; but it betrays not the slightest symptom of a disposition to retaliate upon the author of its distresses. You are hungry now, and that, you will say, is your excuse; but you feed your horse in so poor a way that it is never otherwise than hungry, and yet, when it tries to snatch a mouthful of grass from the wayside, and you lash it to make it go on, does it not quietly yield to your wish? Observe the whole demeanour of the animal, and think of it well. *It is patience in a living shape.* Let its downcast look, its labouring muscles,

* The vision of the mirror is, in this case, described from circumstances of actual occurrence.

its breaking yet submitting heart, at length pass beyond your mere sight, which is familiar with them, and enter the soul within, and let the consequence of the lesson be mercy and patience. Farewell." The angel then vanished, and the old man, before advancing another step, took the load from his horse, and allowed it to feed for ten minutes upon the thistles by the wayside; after which it prosecuted its journey with renewed spirit, and he did not once lay his lash upon it during the remainder of the journey.

The Angel of Patience does not now come in a bodily form upon the earth; but the world abounds as much as ever with lessons resembling those which she used to read to mankind. The sentimental grievances of the great and rich may yet be assuaged, if the great and rich will only think upon the many severer evils which others are every moment bearing, and bearing, perhaps, with magnanimity and resignation. The evils which befall every station of life may be softened, if we only reflect on the worse afflictions of the next lower sphere. It is not that we can

> By thinking on the frosty Caucasus,"

but that an *example of patience* may be drawn from the well-borne sufferings of others. Nor is there any class of society so sunk to the bottom of wretchedness, but such an example may still be found even for them, for, rightly considered, the miseries and sacrifices which animals are so largely called upon to endure on man's account, and which they generally endure with so perfect a patience, are calculated to soften and bring down to submission the most obdurate hearts.

POPULAR INFORMATION ON POLITICAL ECONOMY.

SIXTH ARTICLE.—RENT.

The inquiry—in what consists that value for which rent is paid? may at first sight appear an idle one. What is primarily apparent is, that land and houses are objects of use and desire, and therefore people will pay for them as they do for other things possessed of these qualities. It very soon becomes apparent, however, that there is a wide distinction between the manner in which land becomes valuable and that in which other commodities are made so; and that the knowledge of this distinction is of very great practical importance in the conduct of human affairs. As an instance of this importance, we may simply note, to arrest the reader's attention, the example of taxation. Whether a tax acts as a direct pressure on the individual, cramping his employment of capital and labour by increasing the impost with the production, or puts the tax-gatherer in the position of a mere fellow-sharer of property, is a question of undoubtedly vast importance. That there is a great distinction between the manner in which the surface of the earth becomes valuable, and that in which other things are so, is so evident, that it scarce needs illustration. Every one must have observed, that, of other commodities, the supply bears something like a proportion to the demand. Shoes and coats are only brought into existence because they are wanted. There may, it is true, be a miscalculation, and a greater number may be produced than that required, but the intention not to exceed the demand is urged by so many motives of self-interest, that they generally bear a pretty near proportion to each other. Coats and shoes, therefore, never make their appearance but when they are wanted, and are worth money; and when this takes place, they are always forthcoming. There are millions of acres of land, however, of the most fruitful and productive nature, that nobody wants, and that are worth nothing; while, on the other hand, there are spots where the most arid soil is of enormous value, as a mere portion of the surface of the earth.

Under the subject of labour, it was stated that there were only two means by which an article could get its value in exchange; first, that it should have been produced by means of labour; second, that it should be an article limited in its supply—in other words, that it should be a monopoly, for every thing of which the supply is limited will find an owner. The greatest instance of monopoly (the term is intended to be used in an explanatory, not an invidious sense) was said to be land. Let us now explain, as distinctly as we can, the manner in which it thus becomes valuable. Dr James Anderson was the first to throw light on the process. He supposed the land of a country to be divided into different portions, of various fertility. While the population is so small that every member of it can supply himself with food from the land that is next him, and there is no competition for one portion of the soil in preference to another, there can be no such thing as rent. It is true that the government of the country, or persons who happen to be possessed of authority in some form or other over their neighbours, may exact from them a consideration for the use of the land, as they may for the privilege of remaining with their heads on their shoulders. Any thing, however, that can be exacted by force, and is not given in virtue of a commercial compact, cannot be termed rent. It is something given, not because the giver gets value, but because he is under compulsion, and the mildest term to be used towards it is that of a tax. When the population, however, of the country in question so far increases that lands which would have been previously rejected as worthless are cultivated, rent begins to exist in favour of those who happen to be possessed of the use of the better soils. These more unfruitful portions no one would cultivate, unless he could gain something by doing so. Whenever the produce of the more fruitful soils ceases to be sufficient to feed the population, or rather when the population finds the supply from that quarter so limited that it will pay something for a little more food, the time has come when the holder of the inferior land may cultivate it. But what does the holder of the more fruitful soil do in the mean time? He who cultivates the poorer land, must demand a correspondingly increased price for the produce, and the possessor of the fruitful tracts, coming into the market along with him, will demand and obtain the same return. The former, then, is a mere labourer, getting a remuneration for the toil of producing food; the latter is getting something beyond the price of his labour, and that something is rent, whether he choose to remain the cultivator of the land himself, and so to earn both the remuneration for tilling it and its value as a monopoly, or find it more agreeable to enjoy the latter in indolence, leaving the former to some tenant, who is not so fortunate as to have the means of living without labour. As population presses, and less promising lands are cultivated, the rent of the more fruitful lands—those first employed—will proportionably increase, and there will be various intermediate grades of rent; the amount being in each case precisely the difference between the price of cultivating the most arid soil that is used by the community, and that of cultivating the portion for which the rent in question is paid. It must always be kept in view that it is not the mere circumstance of cultivating poor lands, but the pressure that occasions their being had recourse to, that causes the rent to exist. Of the existence of that pressure, however, the resort to poorer lands is the proper indication, while it is likewise the measure of the extent to which it operates.

The deductions from the above doctrine, are of the very first practical consequence to the welfare of society. The most important consideration connected with them, perhaps, is the extent to which the existence of rent is shown to depend on commerce and manufactures. It is not the production and consumption of an abundant supply of the fruits of the earth that creates rent, but a pressure of the population on the amount produced, whatever it may be. There may be thousands of acres yielding a munificent harvest, yet it is not until the pressure upon that produce causes recourse to be had to a less fruitful acre of soil, that rent is as it were spread over those districts, the superior fruitfulness of which has brought them first into use. The outlay that may be necessary to make this additional acre produce the same quantity of grain as the more fruitful acres have done, may not be above £1, but the necessity of having recourse to the spending of that pound, may bring into existence thousands of pounds per annum of revenue to those who are so fortunate as to find themselves proprietors of the fruitful soils. Now, it is commerce and manufactures that are the temptation to men so to congregate together as to create this pressure on the produce of the soil. Were there no such inducements to dense population, it would be the interest of every one to locate himself in the spot where he found most room to grow the food necessary for his subsistence. Were there no commerce, indeed—no interchange of commodities—there would be no other means of securing a subsistence. If one man should grow more corn than he wanted, where would any other find money to buy it with? In these circumstances, if population increased, the more fortunate among the people would be raising their bushel of corn with little labour in the fruitful districts, while others would be extracting it with a greater amount of labour from a less salubrious soil. There would here be no common market in which the produce of the rich and that of the poor soil could meet, and be sold at the same price, the difference between the cost of raising the two going into some one's pocket in the shape of rent. In such a case there might be exactions of any conceivable kind by the lord from his slaves; he might, through force, or by the simple efficacy of their habits of obedience and dependence, exact their service, their grain, or their lives—but rent, or a commercial consideration for the use of his lands, he would not have.

The present position of Hungary corresponds pretty closely with this hypothetical case. The landowner (if he whose interest is more in the individuals that grow upon the land than the soil itself, should be so named) is very absolute; he has multitudes of exactions in the shape of produce and services. The persons (and, until lately, the lives) of his serfs are entirely at his disposal. If he possess a carriage, he will easily get it driven, for he can command the services of the peasantry and their cattle in any part of the kingdom. Thus powerful in his own neighbourhood, and even rich, for he has the fruits of the soil almost indefinitely at his command, he is a beggar elsewhere, for he has no money. Five acres of the comparatively poor soil of East Lothian probably brings as much money rent as could be got for a fruitful district in Hungary. A very long time, however, has not elapsed since Scotland was in the same position. The potent Cameron of Lochiel, who headed eight hundred of his own tenants on the field, and the population of whose territory must therefore have amounted to some thousands, drew no more than L.500 a-year in rent. Had it not been for our spirit of enterprise, for our shipping, canals, steam-engines, and spinning-jennies, the rich aristocracy of Britain would have been like that of Hungary, or at most no richer perhaps than the nobility of Russia, who, because they trade in produce (hemp and tallow) to this country, are a degree higher in the scale of wealth. It is thus that a circumstance, which to many has appeared mysterious, is easily accounted for—that while the riches of our merchants and manufacturers have so rapidly increased that what was formerly affluence is now insignificance or poverty, the landed aristocracy, too, have advanced in riches, in a ratio not disproportionate, and are able to retain a portion, if not the whole, of their ancient importance in society. In some cases, indeed, where the pressure of population in large towns has made a few square feet in a particular position more valuable than acres elsewhere, the fortunes made by proprietors have been princely, and, we believe, far beyond what individuals connected with trade have ever cleared. It is, then, our having obtained and kept the start of the rest of mankind in commerce and manufactures, that makes our aristocracy the richest in the world. If circumstances should arise to deprive us of these advantages, it will be on the owners of the soil that the evil will press with most permanent and unmitigated force. The capitalist can remove his commodity with comparative ease; the labourer even, though with more difficulty, can generally escape in the end; but the land must remain, to take its chance of what it can fetch in the deserted market.

It is another important deduction from the above theory, that rent, instead of being a factitious creation for the advantage of a particular class of men, is a thing inherent in the nature of land when placed in a certain position, and cannot be got rid of. Rent cannot be extinguished, and any attempt to annihilate it would only have the effect of making it change hands. While a quarter of grain can be raised a shilling cheaper in one acre than another, the former will bring rent to somebody. If the government should compel the person who cultivates the fruitful lands to sell his grain at a proportional rate less than what the tiller of more sterile spots requires for his remuneration, the result would be that one producer would be selling grain cheaper than another, and that the cheap commodity would be bought up and retailed, the retailer standing in the position of the landlord, and drawing his "rent;" for when brought to a common market, commodities always find a level in price. Nay, were it practicable (as undoubtedly it is not) to prohibit every one from buying more corn than what is necessary for his own consumption, those who are so fortunate as to obtain the cheap grain sold by the cultivators of the fertile lands, would reap the profit which the landlord would have obtained had the market been free, as, from paying less for their food, they would have a proportionably larger sum to spend on other commodities. Thus, if A, having the good luck to purchase his corn from a cultivator of fruitful land, get it at 40s. a-quarter, while B must resort to the produce of the more barren soil, which cannot be afforded under 60s., A gains 20s., which, though he may never see the soil by which he profits, is equivalent to his receiving that sum in the form of rent. All this can only exist, on the presumption that the density and wealth of the population cause a resort to inferior lands. If by an infringement of the rights of property, or any other instance of bad legislation, this resort is discontinued, then, indeed, rent may cease to exist.

The theory of rent throws, as we have already hinted, an important light on the pressure of taxation. Suppose a fixed tax on land to have existed from time immemorial, or so early that there is no one alive who can say that his income or his expectations have been made less by it than they were before, that tax presses on no one; it is as if the receiver of the tax were a joint proprietor. If the tax should continue to increase at the same ratio with the rent—for instance, if it should always form a tenth part of it—the same will be the case. The landlord pays nothing, for that part of the rent which is tax he never enjoyed; he could no more look to it as his own, than he could to the rent of his neighbour's estate. If his own rent increases, it is by circumstances over which he has no control—by the industry of his neighbours and the increase of population; and it cannot affect him, that there is in the receiver of the tax a fellow-proprietor who profits in the same ratio. Nay, if the whole increase of rent went in the form of a tax, the result would be the same. The proprietor would just be as if there were no increase of wealth or population

Digitized by Google

about him, and as if the good fortune attending these circumstances had accrued to the state and not to him.* Let the tax, however, be, not upon the rent, but upon the produce; it then changes its nature from what might be called a joint proprietorship on the part of the state, to a pressure on enterprise and energy, which, like all other taxes so directed, must impede to a certain extent the progress of wealth and improvement. The effect of such a tax will be best viewed by considering it as paid by a tenant. So long as that tenant employs the lowest practicable amount of capital in his farm, so long as he attempts to rear only the most cheaply raised produce which will enable him to live and pay his rent, the tax is a deduction from the rent, and is precisely similar to such an impost as that above quoted. If, however, the farmer wish to raise a more expensive crop—a crop in which the capital laid out bears a larger proportion to the amount of the rent—he feels that the more he lays out, the more tax he pays, and so there is an impediment in the way of his improving the soil. The landlord will not take less rent because the farmer wishes to employ more capital. The more capital, however, he employs, the more produce he rears, and consequently, having to give a proportion of it away, the more he pays in taxes.

TRY AND TRUST.

A STORY, BY MRS HALE.†

"DEAR, dear Henry! how glad I am to see you. Oh, you cannot tell how weary the hours seem when you are gone!" exclaimed Mrs Harrison, as she ran with extended hands to welcome her husband's entrance. He fondly returned the caress of his young and lovely wife, while she continued to speak of her joy at seeing him, and of her lonely feelings during his absence.

"Do you think, Ellen, that I would leave you, if it were not absolutely necessary?" inquired he, soothingly. "Can you believe I would stay thus long from you by design?"

"Oh! no, no—I do not think you would; and yet it does sometimes appear strange that you can stay so long from me; and in the evening, too. I am sure that no business could detain me thus from you."

"Not if it were necessary to secure my happiness, Ellen?"

"I cannot understand how that would be secured by a course which was rendering you miserable."

He smiled sadly as he replied, "If our home were in Eden, my love, where our only occupation would be tending flowers and gathering fruits, on which we could banquet the year round, then we might consult our present feelings only, giving all cares for the future to the winds. But we do not live in Eden."

"And therefore must be miserable. Is that what you wish me to understand?"

"No, no; we need not be miserable because we do not dwell in Paradise; but we shall be disappointed, if we expect to find its perfect bliss in our cold, barren world. We are too apt to forget that life, for fallen man, has no real, lasting, virtuous enjoyments, which are not earned by toil, or obtained by self-sacrifice of some sort. Every pleasure has its price. I could not enjoy this happiness of folding you to my heart, and feeling that you are my own, and that you are so provided with comforts as not to regret that you have united your lot with mine for ever, if I did not practise the self-denial of leaving you, to pursue the business and studies of my profession many hours each day. Can you understand this?"

The young wife looked up to her husband, and the tear that moistened her soft, blue eye, added the lustre of feeling to a glance of love that sunk into his soul. He knew that he was comprehended, was absolved. He had never told her of the difficulties with which he had to struggle; accustomed, as she had been from her birth, to every luxury and indulgence that wealth could command, he had thought that the details of anxieties, labours, and disappointments, which those who are born poor must encounter in the stern strife of their worldly career, would sound too harshly, would make her unhappy. He could not bear to see the shadow of a cloud upon her brow. He dreaded, more than any worldly evil, that she should feel the pressure of care. His whole soul had been engrossed, since the first certainty that she would be his wife, with devising the means of supporting her in that style which he fancied was absolutely necessary to her happiness. Men seldom form romantic ideas of "love in a cottage," if they have had to struggle with the realities of poverty. Not that Henry Harrison was an avaricious, or even a worldly man; he did not covet riches for himself; he was not ambitious of show or parade; but he did tremble lest his young wife should endure one privation—lest even the winds of heaven should visit her too roughly.

The union of Henry Harrison and Ellen Wise was truly a love marriage; romance and adventure had marked their love from the beginning, and it seemed hardly probable that their married life would run on in the calm canal-like current of common events. At least they fancied that some peculiar bliss was and would continue to be theirs, because their first meeting had been so strange, and, in their estimation, so fortunate.

It happened that Henry Harrison, in the summer of 1818, made a pedestrian tour from New York to Canada. He had just completed his study of the law; and, before entering on the duties of his laborious profession in the "commercial emporium," determined that he would see a little of the great world, and, to make the most of the opportunity, that the greatest natural wonder in the world should be among the objects of his tour. So he made Niagara the chief point of his movements. He visited it as he went, and on his homeward journey. And while on the Table Rock he minuted in his journal, that "his heart was so filled with awe and admiration for the sublime spectacle before him, that it would be impossible for a long long time to admit any other sentiment!"

That afternoon, he received a letter from a particular friend of his in Troy, urging him to visit him at his house on his way home. The wardrobe of Henry was, in the first instance, only graduated to his travelling convenience on foot, and it had borne the wear and tear of four weeks' travel; its soiled and dilapidated condition, therefore, was reason good for promptly deciding to refuse the invitation. But that night he had a dream—a vision, as he always called it. He thought he saw a lady of majestic presence and serene countenance approach him. In her right hand she held a veiled picture, which she advanced towards him, with a smile of sweetness that filled his soul with rapture. He strove to raise himself, that he might lift the veil and examine the picture; but the stately lady motioned him to desist, and, at the same time, addressing him in a sweet but deeply impressive tone of voice, said, "Go, visit your friend, and the veil shall be raised."

Henry awoke in some perturbation; and, though of course he did not acknowledge to himself, nor do we pretend that the dream influenced his conduct, yet so it happened, that before he had finished his breakfast, he had decided on visiting his friend at Troy.

Nothing particular occurred, however, during the day he passed in that city, and he was obliged to leave it early the succeeding one. But his friend insisted, that he should, before setting out on his pilgrimage home, take a stroll with him to the top of Mount Ida, then a very celebrated spot in the estimation of all lovers of the picturesque in that neighbourhood. The spirit of improvement is now passing in triumph over the domain of romance, and has already laid low the pride of the mountain; but when our hero, at early day, ascended the height, and saw the wide amphitheatre of green hills displayed around, gently sloping downwards, till they melted, as it were, into the rich vale, where rose the clustered dwellings of the city, each house made beautiful by the thought that it was the home of some happy family—for to a wanderer every home seems a place of rest and happiness—his heart rejoiced in the sight. The first rays of the morning sun were illuming the earth. The broad bright Hudson in the distance shone like a line of flashing diamonds as its ripples caught the sunbeams. But the eastern sky was the object that most rivetted Henry's gaze. There is something exalting to the spirit in watching from a mountain top the rising of the sun. Only the blue firmament seems to intervene between the spectator and heaven, from which the clear light of the new day appears to issue, like a stream from an inexhaustible fountain.

As the two friends were about descending the hill, they observed a carriage approaching. Just as it reached the top of the height, the horses became frightened by the sudden flight of a hawk, which had been scared by their approach from its perch on the stump of a blasted tree, that inclined over the road. It dashed directly in the face of the horses. The startled animals reared high, and then plunged forward so suddenly, that the driver was precipitated from his seat, and the carriage, forced against a projecting rock, was overturned and broken. But even this catastrophe did not effectually check the furious horses, and they seemed on the point of dragging the shattered vehicle over the precipice into the deep channel of rocks, where the mountain stream is seen rushing and throwing up its spray, as if chafed with rage at its confinement in that ravine. But at this critical moment, Harrison dashed forward at the peril of his own life, seized the reins, and with his strong grasp forced the horses' heads against a large tree which grew on the brink of the ledge. Here he held them fast, till the two persons contained in the carriage were liberated by his friend, when, his strength being exhausted, they burst from him, and plunged down the bank.

The persons thus saved from, as it seemed, certain death, were the Honourable Mr Wise of Philadelphia, and his daughter. The young lady, who had uttered no cry of terror, looked on her father and fainted, when she saw the horses take their fatal plunge over the precipice. He was slightly injured, and so much overcome, that Henry's friend had to support him; therefore none but Henry remained to succour the lady. He raised her up, and, as her head reclined on his arm, he gazed on her face, the loveliest he had ever seen. His dream now flashed upon his mind, and his willing fancy gave it the force of prophecy. "Yes," he mentally murmured; "yes, she is destined to be mine!" He looked again in her face, and his heart affirmed the decree, "She shall be mine!" And that consummation he never doubted, though he could not then anticipate a very speedy union.

The progress of the acquaintance we will pass over. It was not, to the lovers, a halcyon period. Mr Wise had held high offices, which conferred the title of Honourable on him, but the soul of honour had never been infused into his bosom. He was ambitious and ostentatious, and had resolved that his daughter should connect herself in marriage with a man whose wealth and family placed him in the first rank of fashion. The gentleman he had selected was the senior of Ellen by some thirty years or more, which time had not all been passed in improving his mind or morals. In short, though not exactly an infamous man, he had been so long hackneyed in fashionable follies—that delicate phrase to soften the vices of the rich—that he was as heartless as Chesterfield would have made his son, had his principles of politeness been fully acted on. And Mr Kerney, the bridegroom-elect of Ellen, had a head which could have computed, as shrewdly as the noble lord himself, the worldly benefit of those "principles." He had calculated closely the benefits to be derived from an union with Ellen Wise. He supposed her father to be a man of handsome property, though not among the nabobs of wealth. Ellen was an only child; her father had offered to enter into a written agreement that all his estates should descend to Ellen at his decease, thereby cutting off the possibility of a second marriage (he was a widower), or at least the alienation of his property from his daughter. Then, she was lovely; and though Mr Kerney was not in love with her, in the holy sense of the term, yet he felt that she was a prize which it would give him triumph to obtain. Then she was young, and he could mould and govern her as he chose. And so the affair had been settled between the father and the old beau bachelor. But Providence had not sanctioned the treaty.

Mr Wise and his daughter remained about two weeks at New York before proceeding to Philadelphia, and Harrison improved the time to confirm, in the heart of Ellen, the tender impression which his gallant daring had made. And she promised to be his, if her father consented. She had never been apprised of the intended alliance with Mr Kerney, as she was only eighteen, and just out of her boarding-school.

"You had better not communicate the arrangement to Ellen till she is under your roof and control," said Mr Kerney to his intended father-in-law. "The young ladies at school will rally her, and may induce her to dislike me, merely because you approve the match."

Mr Wise acquiesced; and though, during his tour with his daughter, he had thrown out sundry hints about matrimony, and the advantages it conferred on a young lady to become the bride of a rich and fashionable man, yet she had never applied one precept of this worldly wisdom to her own case. And so little did she understand the real character of her father, that she fancied the only objection he would make to the application of Henry for her hand, would be her youth, and the impossibility of parting with his only child. For was not Henry a lawyer, one of her father's own profession? And had not Henry saved the life of her father and of herself? And had not her father wealth sufficient for them both? Henry had told her that he had no fortune but his education and his own energies; and would not he, when he had always been so kind and indulgent, even lavish, in gratifying every want and wish of his daughter, be willing to make a small sacrifice, if it were a sacrifice to him that she should wed a poor man, when he had learned that her happiness, and the happiness of the man who had saved her life, were concerned? Oh, she knew he would consent!

But she was totally mistaken. She knew not the spirit of worldly men. She knew not how every gentle, generous feeling in the human breast may be blasted by selfishness, as the vegetation of the fairest spring may be withered by the scorching simoom of the desert.

Mr Wise was not satisfied with giving a positive and irrevocable refusal to the lover's modest request of permission to hope that he might, if he proved himself worthy, be accepted; but he insulted Henry with bitter sarcasms on the folly of a young *débutant* in a profession which required such a length of time for success, presuming to fall in love with, and raising his pretensions to, a lady of wealth, when he had not a dollar of his own. How the blood of the young man boiled in his veins at these taunts! But, for the daughter's sake, he suppressed his wrath against the father. As Aaron's rod, becoming a serpent, swallowed the other serpent-rods, so the feeling of love, when raised to a passion, frequently absorbs all others; and when it does this, it cannot easily be overcome.

The lovers were separated, but not till they had pledged their troth to each other; and, though Ellen would give Henry no promise to marry him till her father should consent to the union, yet she led him to hope that that consent would be gained. So they parted; and, as he was not in a situation to support a wife, perhaps the trial which her love was about to undergo was not without its secret satisfaction to him. He triumphed in the thought that her affection would be stimulated by these obstacles; his own, he felt, would be unchangeable.

The letters which passed between them during the succeeding half year, were to both a source of intense interest and happiness. He gathered from hers, that, although surrounded by all the luxuries of wealth and blandishments of fashion, she was still his own Ellen, counting one letter of love from his hand more precious, a thousand-fold, than all the gay pleasures of which she was rather a spectator than a participant. And she learned that his business was increasing, his hopes of success brightening, and his heart and purpose animated with the energy which a virtuous love inspires. His noble sentiments and just reasoning opened to her mind a world of new and profound thought; and, in her turn, she imparted, by her pure feelings and brilliant fancies, a light to his path, and that delicate perception of the good and beautiful in nature and character, which refined his tastes, chastened his passions, and exalted his aims to be worthy of the innocent, ingenuous, and lovely being, who was thus resting her hopes of earthly felicity on his truth and honour.

Mr Wise, in the mean time, was managing with his deftest skill to bring about the marriage of his daughter with Mr Kerney. Ellen was resolute in her refusal to admit him as a lover; yet she was so influenced by her desire to promote her father's happiness, that she treated his friend, as she always called Mr Kerney, with becoming respect; and Mr Wise would not believe it possible that she would forego the advantages of wealth and sta-

*It has to be observed, that we here speak of pure rent, as above defined—not of the increase to his returns which the proprietor may obtain by outlay on his property.

† From The Token, an American annual for 1833.

Digitized by Google

tion which the union with a rich man promised. How he loved the world! It seemed as if its treasures and pleasures were growing dearer to him every day he lived; and he planned to live long, while death was shaking the few last sands from his glass. Mr Wise had been conversing with his intended son-in-law on the subject of the marriage, and, when the latter expressed some doubts that Ellen would not, for a long time, consent to the marriage, the father, suddenly rising, exclaimed, "I assure you, Mr Kerney, that Ellen shall be yours—yes, in one month, if I live, she shall consent to marry you—or ——." What he would have added, was never known. Perhaps a malediction against his only child, if she resisted his arbitrary command to sell herself for gold, was rising in his heart. But he was spared the sin of giving expression to his thought. He uttered a groan, fell backward, and immediately expired.

Ellen wept over him in deep and sincere sorrow; and the world soon allowed that she had cause of grief. It was found, on examining the affairs of Mr Wise, that he was a bankrupt to a large amount. The creditors seized every thing—even Ellen's harp was not spared; and Mr Kerney, like a prudent man as he really was in pecuniary matters, fearing he might be appealed to in her behalf, took passage in the first Havre packet, with the avowed intention of passing several years abroad.

"Poor Ellen! What will become of her?" exclaimed Miss Rickett, in a soft, sentimental tone, which she intended should pass for compassion towards the destitute orphan. "Oh, I do so pity her!" The malicious sparkle of her eye told of a different feeling.

"You may spare your sympathy, for Miss Wise needs it not," replied Mrs Alden, with that calm but deep expression, which tells the pretender to kind feelings that her dissimulation is perfectly understood. "The orphan has a true friend."

"Yourself, my dear madam?" inquired the spinster, with an admiring smile.

"She will remain with me a few weeks longer; then she is to be married."

"Married! indeed! Why, Mr Kerney has left the country."

"True; but Miss Wise was never engaged to him, and never would have married such a man. She has happier prospects."

"Some sentimental love affair, I presume," said Miss Rickett, with a sneer. "I think you are the advocate of love marriages."

"I am the advocate of truth in all the relations of life; and, till the marriage-contract sanctions the union of husband and wife for purposes of mere convenience, I shall consider that those who at the altar pledge their love to each other, are guilty of perjury, unless they feel what they profess."

"Pray, who is the favoured swain?"

"A young lawyer of New York."

"Ah, some Yankee speculator, I presume," said Miss Rickett, scornfully. "But I hope Miss Wise will be cautious. This Strephon may enact the second part of the 'Mercenary Lover,' and be off like the old beau."

Mrs Alden gave her a look. How emphatic may be the language of a look! Miss Rickett felt that she was an object of utter contempt to the good matron, and, for once, the silent rebuke was effectual; not another word of slander or satire did she utter. What a poor mean figure detected envy and malice display!

* * * *

They were married, Henry Harrison and Ellen Wise; and they were happy, for their love was of that deep and tender nature which perfect sympathy of feeling and congeniality of mind and taste inspire. It was exalted too, for it was based on perfect faith in the worth and truth of each other. Yet Henry had not ventured to open all his heart to his young bride. Had he felt himself free to obey the dictates of prudence, he would hardly have dared to indulge his desire for so early a marriage, as his profession had hitherto afforded him but little more income than sufficed for his own support. It was a time, too, of great depression in business, and the prospects of the country were gloomy. But Ellen was destitute of a home and protector, and he could no longer endure the severe calculations of prudence which had forbidden their union. He married; and, after all the expenses attending the event were settled, his lodgings furnished, and his bride seated in her genteel parlour, arranged in a pretty though not expensive style, he found he had barely sufficient cash left to pay the first month's board. True, he had debts due from several clients, but he knew it was very uncertain when he should obtain payment. How could he enter into these vexing details to his young and utterly inexperienced wife?

Mr Wise had always destined his daughter for a rich husband. She was, he well knew, exceedingly beautiful; he had studied to educate her in the manner which would make her natural graces most attractive. Holding in the most sovereign contempt the Bentham philosophy, which inculcates the "greatest happiness of the greatest number," his efforts had only selfish indulgence for their object; and he had trained Ellen in his own luxurious habits and expensive tastes. But the pure diamond will glow in the dark mine as brightly as on the coronet of a king. Ellen had a disposition which prosperity could not corrupt. Her mind was naturally upright, or, as a phrenologist would say, she had large *conscientiousness*. And this simple integrity of heart had always resisted the blandishments which her father's vanity had drawn around her. Yet she had had no practical experience in lessons of self-denial, and could not, therefore, know the little methods of management and daily sacrifices of taste to necessity, which real poverty imposes. She was aware that Henry had no fortune; yet his profession was, in her estimation, one of the first in the world; and she had never doubted his ability to maintain her according to her station. But those few words, that sad, loving expression in her husband's eye, as he gazed so tenderly on her, told the struggle of his soul. She now felt that she was the wife of a poor man; that, to shield her from suffering, he was sacrificing himself. The whole depth of that adversity, from which he had rescued her at the peril of his own peace, was, in a moment, unsealed; and that night, during which she scarcely closed her eyes, there was opened before her aroused faculties a new world of thoughts, hopes, and resolutions. The next morning her manner towards her husband evinced more than usual tenderness; and, when he went out, her parting kiss was given with that heart-devoted affection, which to him was a recompense for every care.

As soon as he was gone, Ellen hastened to a shop where she knew fancy work was sold. She could devise no way of earning money except by her needle. Her education, though it had cost more money than it requires to carry half a dozen economical young men through college, had been unsystematical. Her masters had taught her the result of sciences, and the show of accomplishments; but the principles which must be comprehended and made clear to the mind before one is qualified to communicate knowledge to other minds, she had never acquired. She played the harp and piano divinely, but could not have given a lesson on either, or, at least, she dared not attempt it. She could draw and paint beautifully, yet knew not the principles of either art. But in needlework she excelled, and had a natural ingenuity and taste which had often excited the admiration of her companions. And, as melancholy reflections on the waste of precious time and money, which she felt was the result of her superficial mode of education, passed through her mind, she turned with something of exultation to the thought that she had loved needlework, and could execute almost every kind with great skill. "Oh, I will employ every moment—I will earn enough to pay my own board! Dear Henry shall not feel distress on my account!" were her mental exclamations as she entered the shop of Mrs Millet.

These bright dreams were soon dispersed. Mrs Millet wanted no muslin nor fancy work; and, when she did give out work of the kind, the prices she paid were so inadequate to the time required for such nice performances, that Ellen found she could not hope to earn half enough to pay her board. While she lingered, in doubt what next to attempt, a young lady entered, and inquired for daisy buttons and frogs. Mrs Millet had none of the colour wanted.

"I thought you always kept a variety. I can nowhere find any," said the young lady.

"I have had the best assortment in the city," remarked the shopwoman; "but the girl that made them for me is dying with the consumption, and I can find nobody ingenious enough to make the nice kind. Needlework is sadly neglected now-a-days."

The thought struck Ellen, "Here is a chance for me." She asked to look at the buttons.

"Can you make such as those, miss?" asked the woman, thinking, from Ellen's blushing face, that she was a diffident school girl, and, from her earnest manner, that perhaps she would try to make them well; "'cause, if you can, I will pay you a high price, three sixpences a-dozen."

"Three sixpences! Ellen Wise seeking employment by sixpences!" were the first thoughts that flashed over her mind. But she recovered her calmness in a moment. "I will try, if you will let me have the materials."

"Oh, certainly; but you must pay for the silk and moulds; you need only take a few skeins of silk, for you may waste it all, and I cannot afford to lose it. I will give you the price I named for good buttons, and four shillings a-dozen for frogs."

Ellen took materials sufficient for an experiment, a few buttons for models, and, after paying for her purchase, found she had only one sixpence in her purse. "Well," thought she, "if the old proverb be correct, that 'necessity is the mother of invention,' I shall succeed. I have need enough to arouse my ingenuity."

And she did succeed "wonderfully," Mrs Millet said, "and would soon earn a fortune." And Ellen felt that she was indeed rich, when in a week from her first essay, she found herself able to earn from six to nine shillings per day. Never, never had she been so rich, so happy. The hours passed away like moments; the days were over before she had time to think of weariness. She only worked while her husband was absent, for she wished to surprise him, at the end of the month, with the sight of her wealth; when his heart was heavy with care, how blessed it would be to find that she had sympathised with him. They had just entered on the third month of their married life, when Ellen commenced her button-making business. The first day of the fourth month the landlady served up, as usual, her bill with the tea equipage. "She made it a principle," she very modestly observed, "never to disturb a boarder with a bill except when his mind was at leisure, which it must be over the tea-table."

Ellen watched her husband's countenance, when, after tea, he opened the paper. As he raised his eyes to hers, she could not forbear smiling. "I am glad you are so happy, my love," said he.

"Are you not happy, Henry?"

"Yes, yes; I shall always be happy while I can make you so. But I have sometimes feared" ——

"That we should be poor, and then that I should be miserable?"

Henry looked earnestly on his wife. She continued, "I know, my dear husband, that you have suffered deep concern on my account; but never fear. I have engaged a fairy to supply me with all I want. I do not intend, like Cinderella, to tax her for a coach-and-six, as I have no notion of going to a ball to gain the favour of a prince while I can see you at home; nor do I expect garments the 'colour of the sun,' but only the modest kind that pleases you; these she has promised me."

He looked more and more puzzled. At last she rose, and, going to her cabinet, brought forth a little box containing her hoarded treasure, and placed it before him. "Take it, my dear Henry; I have earned it for you!" And the gush of joy that thrilled through her heart melted to a flood of those sweet tears which only spring from the very fullness of pleasure.

That evening, as they sat together, she told him every thing; all her feelings, thoughts, plans, and performances. And he confided to her every doubt, fear, and perplexity, that had shadowed his path. "But these are all removed now, dearest," said he. "We now understand each other; we are now one—one in purpose, plan, pursuit. We shall succeed. God will bless those who TRY AND TRUST."

And they did succeed. Henry Harrison is now one of the brightest ornaments of his profession in the great state of New York. He is also one of the most estimable men in private life, rich enough to gratify his refined tastes and benevolent feelings; and his wife is still the cherished object of his affection, his confidant, counsellor, and helper.

The same devoted and faithful love that first awakened Ellen's spirit to exertion, has animated her in acquiring the requisite knowledge of all her domestic duties. These she has performed, not as tasks, but as pleasures. And she often alludes to her first experiment in the use of her own faculties to gain an independent support, or rather to prevent herself from being a burden to her husband, as the period when her judgment was really exercised, her mind enlightened to discern the moral relations of woman in her social and domestic character, and her heart strengthened to endure, and refined to enjoy, the lot assigned her. "I have," she remarked to a young friend who was about to be married, "never regretted that I was compelled to resort to button-making. The man you are to marry is rich; but, should any reverse occur, never lament for yourself, but strive to assist him. The effort will make you happy; and there is no grace, no perfection, that will so surely gain the esteem and love of your husband."

DRAMATIC PROVERBS.

THIS amusement, like Bouts Rimés, took its rise, very appropriately, in France. It consists, as its name partly imports, in the illustration of a proverb by a dramatic scene got up extemporaneously by two or more members of a social party. The more forcibly the meaning and spirit of the selected proverb are developed by the language, gestures, and actions, of the parties who take the task upon them, the better is the purpose of it fulfilled, and the greater the consequent entertainment. Of course, no slight amount of wit and readiness of thought is requisite for the successful execution of these *Proverbes Dramatiques*, and ordinary society in Britain is as yet little accustomed to see them done. But in the literary circles of Paris, the exhibition is a common one, and gives great amusement. We have before us an excellent account of one instance in which the acting of proverbs was practised with great success in Dublin. The narrator is Prince Puchler Muskwa, and the chief performers were the well-known Lady Morgan, and her sister Lady C——. We give nearly the whole scene, as we could in no way better describe the general nature of this entertainment:—"The most amusing part of the entertainment," says the German prince, "was the acting of proverbs by Lady M—— and her sister Lady C——, who both extemporised admirably. Among others, they performed '*Love me, love my dog!*' The manner of doing it is then depicted nearly as follows:—

Persons of the drama:—Lady M——, an *old coquette*; Lady C——, an *Irish fortune-hunter*; her eldest daughter, a *French waiting-maid*; the youngest daughter, a *captain of the Guards*, a lover of the lady. Scene the first; Lady M——, with her maid at her toilet. Confidential advice of the maid, in which she betrays various laughable secrets of the toilet. Distress of the coquette at the first appearance of wrinkles. Assurances of the Abigail that by *candle-light* nobody can be handsomer. Former curious love affairs then talked of. "Hush!" cries the maid suddenly, "I hear the captain." This personage, an exquisite, enters with great fuss, carrying a little dog under his arm; and after some tender compliments, tells his mistress that he is obliged to rejoin his regiment, and wishes to leave her his little Fidèle, that she may be kept in mind of the fidelity due to him. Burlesque protestations, sobs, embraces, and farewells follow. But lo! the Irish fortune-hunter steps on the scene after the captain is gone, and, by dint of brass and address, overcomes the feeble resistance of the lady, and gets her consent to sign a marriage-contract, by which her whole fortune is to be transferred to his guidance. Just at this juncture, however, he observes the dog, and, finding out the truth regarding the ownership of it, from the stammering confusion of the lady, thinks it fitting and proper to play the part of the jealous infuriated lover. He insists on the instant expulsion of poor Fidèle, and, having gained over the maid by a dexterously administered purse, throws the dog out of the door, while the waiting-maid holds back the half-reluctant lady. It chances that the captain had forgotten to leave Fidèle's collar, and, returning with it, is just in time to receive in his arms his poor canine pet, so unceremoniously dismissed. Now follows a mighty blustering between the rivals, who look at each other so canniballishly, and talk so big, that the women take to flight. Left alone with his opponent, the captain draws his sword, and compelling the Irishman to make a rather hasty exit by the window, remains master of the field; with which consummation the scene closes.

"The skeleton here is meagre," says the prince, "but the spirit, humour, and wit, by which it was filled out, rendered it extremely entertaining. The imperfections of the costume made it only more piquant. The ladies had but put on a coat and waistcoat over

Digitized by Google

their own dresses, and stuck a hat on their heads. Their swords were riding-whips, and Fidèle a muff." As gentlemen may be performers as well as ladies, though chance ordered it otherwise in this instance, there need exist ordinarily no such imperfections in attire.

First introduced into society, after the fashion here described, dramatised *Proverbs* have since taken a fixed and respectable place in the literature of France. At the present day, M. Theodore Leclerq, a writer of ability, has produced no fewer than eight volumes of them, and these are much spoken of and admired. Alfred de Vigny, one of the cleverest novelists of the day, has also turned his attention to the same line of composition. It must be confessed, however, that to dramatise proverbs on paper, with deliberation and the power of revision, is a task of a very different nature from the extemporisation of them orally. Lady Morgan, who, not to speak of her uncommon talents, had spent much of her time in France, and had doubtless practised the amusement very frequently, might succeed perfectly in delighting a company in the manner described; but the task is too difficult a one ever to be extensively prevalent in ordinary society, unless, indeed, parties give themselves the advantage of considerable preparation.

A FEW WEEKS FROM HOME.

INDUSTRIAL SCHOOLS AT OKHAM, EALING, AND HACKNEY-WICK.

My next visits were to several schools in and about London, chiefly those in which industrial occupation has been introduced. The establishment at Norwood, for the rearing and educating of pauper children, I was glad to find, continued to flourish. Within the last twelve months, an infant-school had been added to the other arrangements, and outline elementary drawing, principally with reference to industrial objects, now formed a branch of ordinary study for a number of the more advanced pupils. I was informed by Mr Aubin, the superintendant, that the introduction of simple drawing lessons on slates, besides amusing the children, had very greatly facilitated their progress in writing—a circumstance not at all remarkable, for skill in drawing and writing depends on the cultivation of the same imitative faculty. This was the first time I had seen drawing taught familiarly to poor children, since my visit to the Dutch and Belgian schools in 1838.

The industrial school with which I commenced my round of inquiry was that established a few years ago by Lord Lovelace, at Okham, near Ripley, in Surrey, with a view to the improvement of the juvenile population in that part of the country, and chiefly those on his lordship's estate. Conveyed in the first place along the South Western Railway, a distance of about fifteen miles, and afterwards transported in a chaise a distance of other five miles, across a generally heathy and broken piece of country, we arrived at the scene of this novel experiment in moral cultivation. A more appropriate region for the introduction of the schoolmaster could not well be found in England. The farmers and peasantry in the neighbourhood are in a state of deplorable ignorance, and, as a matter of course, are deeply prejudiced in favour of old usages and a vegetative existence. Their houses, farm-offices, and style of husbandry, are, I should think, scarcely an advance upon what existed in the same part of the country at the time of the Anglo-Saxons. They have no notion of employing any species of improved mechanism in their profession, such as thrashing-mills or fanners. On visiting the establishment of a farmer who had about 150 acres in crop, I found that thrashing is still entirely performed by the flail, and that the chaff is cleansed from the grain by throwing it against the current of air which, in windy weather, blows across the floor of the barn. I venture to say that such a barbarous practice has not been heard of in Scotland for at least half a century. The only existing amusement, or means of recreation in the neighbourhood, is an adjournment to the beer-pot at the nearest public-house.

It is in the midst of this intellectual desert that Lord Lovelace has endeavoured to introduce the means of cultivation. To improve the condition of the more humble class of labourers, as well as to reclaim some of his waste land, his lordship has afforded allotments of an acre, or half acre, to those who are willing to cultivate patches of that extent at their leisure hours, charging a very small annual rent. The field containing these allotments is now, I am glad to say, showing manifest signs of improvement, and its cultivators have in almost every instance benefited by their industry. The rent is not more than twenty shillings for an acre, and from a piece of ground of that dimensions, one man lately realised L.25 by his crop. The chief articles cultivated are potatoes and peas. At the time of my visit, the only individual at work was the wife of one of the renters, who had come a couple of miles from home to labour with a hoe on her small potato ground. The principal drawback to a more rapid and effective improvement of the soil than these poor people can accomplish, is the want of manure; for the kind of husbandry by which that article may be largely produced, is not understood or acted upon in this part of the country.

Passing the allotment ground, we shortly arrive at the enclosed field, in which the school establishment is situated. The school-houses and dwellings for the teachers consist of a series of low buildings, in a style of architecture not the most suitable for such a purpose; and in front of them are a few acres of ground laid out for the use of the pupils. The school, which contains both boys and girls, is in two distinct divisions—one for infants, and the other for advanced pupils; the total number of children in the institution was 160. The fee is 1d. per week for each pupil. This little seminary is the offspring of generous wishes, for which its founder deserves much credit; but, from what I saw of it, I was impressed with the idea that considerably larger expenditure would be required to do full justice to a design upon such a scale. In both departments of the school, I nevertheless found an active and liberal system of instruction, each of the two masters being evidently desirous of promoting the welfare of the establishment. In the school, there was a library of entertaining little works, which I was informed were sought for and read with avidity by the elder boys and girls; and this is clearly so much gained from the great outfield of ignorance in the district. The course of industrial occupation was on a much more limited scale than I had expected. It was, I believe, part of the design to instruct the boys in various handicrafts, but nothing of the kind has yet been attempted. The only employment is gardening, which is pursued at certain hours by a number of the boys. Each is allowed the sixteenth of an acre at a rent of one shilling, and the produce, whatever it may be, is entirely their own. Several boys were busily engaged in delving their small patches, and the crops of potatoes and peas, which were showing themselves above ground, were in some cases tolerably abundant. I was informed by the superintendant, that in general the gardening was pursued with little animation, as the boys have no means of providing manure to fertilise the soil, and as there was no population in the neighbourhood to purchase the produce. Upon the whole, the Okham School, though doing some good, cannot be said to be in a very flourishing condition.

My visit to the industrial school of Lady Byron at Ealing, was much more satisfactory. Ealing is a village in Middlesex, situated some five or six miles west from Paddington, and may be reached from that outskirt of the metropolis in about fifteen minutes by the Great Western Railway. It is a neat, genteel-looking place, with a few hundreds of inhabitants, and various circumstances indicate a different condition of things from that which prevails at Okham. The school establishment here, which was begun and patronised by Lady Byron about five years ago, and served in some measure as a model to that of her son-in-law, Lord Lovelace, possesses nothing attractive in its exterior. It is situated in a retired part of the village, and originally consisted of a barn and stable, which have been plainly altered and rendered suitable as a school and boarding-house. At the time of my visit, the school consisted of ninety pupils, all boys, whose ages averaged from nine to twelve or thirteen; a number were boarders from London, being committed by their parents to the charge of Mr Atley, the master, for the purpose of initiation in industrial occupation, as well as ordinary branches of learning. The fee for day scholars is 2d. per week. It happened to be a holiday when I entered the large enclosure, but, notwithstanding this circumstance, I found a number of the pupils busy in their gardens, and the master assured me that, with few exceptions, the boys are happy to devote all their play hours to labour. Escaping from the school-room, they hasten to the tool-house for their spades, and are more delighted in keeping their small patches of ground in good order, than most boys are in pelting frogs, laying waste a parterre of flowers, or following out any other anciently established routine of destruction.

According to the rules of the establishment, the land is let in patches of five and ten rods, for which rent must be regularly paid. Ten rods are let for 3d. per month, and five rods for 1½d. There are at present forty tenants, the greater part of whom possess only five rods, that being a sufficiently large stripe for the management of any single boy who has not acquired considerable confidence and experience. The crops universally grown are the same as those at Okham—peas and potatoes—but there are likewise a few other things, and some of the gardens are prettily embellished with flowers. The boys help each other in their labours, which must promote much good feeling amongst them, and train the mind to social intercourse. I was delighted to learn that these out-of-door labours, conducted, of course, under the eye of the master, have a moral tendency. No boy is ever known to steal any thing from another, and no one injures his neighbour's property. The dignifying and improving power of labour was probably never so practically manifested as in this interesting juvenile community. Some of the more skilled pupils reap solid and immediate benefits from their industry. Gentlemen in the neighbourhood, with the best motives, purchase vegetables from them at their fair market value; and there being thus an outlet for the produce, no pains are spared to raise the most abundant crops. One boy, I was told, realised L.2, 8s. of profit last year by his crop, and another L.2, 4s.

Besides gardening, the boys are taught carpentry, and to use their hands in any other occupation that falls in their way. I was shown an outhouse which they had built with brick and mortar, and finished in every respect except slating. This edifice was designed as the carpenter's shop, and was shortly to come into use. The country air and exercise to which the pupils are exposed, the happiness they enjoy in their rural labours, and a mild routine of instruction in school, unite in keeping them in good health and invigorating their moral and intellectual faculties. The schoolmaster spoke also approvingly of their advancement in simple religious knowledge, as far as he was able to communicate it, and lamented that the clergyman of the district, though humbly requested to give his countenance and advice in this branch of education, had pointedly refused to do so, alleging as a reason, that the institution was not in connexion with the national schools. This statement only corroborated what I heard every where else, that the only persons who either looked with disdain on the efforts of the schoolmaster, or assumed a hostile attitude towards them, were the clergymen in the neighbourhood. I mention the circumstance with much sorrow, and hope for better times.

The establishment of the "Children's Friend Society" at Hackney-Wick, in the eastern environs of the metropolis, is very different in many respects from either of the preceding institutions, but is equally entitled to rank as a school of industry, and may appropriately enough be described in the present paper. It is almost needless to mention a fact with which most persons are acquainted, that London and its densely populated suburbs abound in poor and friendless children, who are either wholly abandoned by their parents to the parish authorities, or are left to pick up the means of a precarious existence by begging or pilfering. The streets of all our large towns exhibit a continually flourishing crop of this class of juvenile paupers—little ragged wretches whom nobody seems to heed, but who in reality constitute the materiel for the supply of courts of justice, and furnish steady employment to an extensive corps of judges, lawyers, jailers, and governors of penal colonies. Ten years ago, the idea of checking, or at least modifying, the growth of juvenile vagrancy in the metropolis, and so if possible preventing subsequent crime and punishment, occurred to a few benevolent-minded individuals, and they forthwith organised the plan of the Children's Friend Society, which has been liberally supported by voluntary subscriptions from philanthropists of every class and party. The institution possesses two asylums—one at Hackney-Wick for boys, and another at Chiswick for girls. It was the former of these which I now went to see.

The establishment, which is situated near the suburb of Hackney, among green fields and gardens, consists of a cluster of humble edifices enclosed from the public thoroughfare, with a large play-ground in the centre, and ten acres of garden and field behind. The buildings include a house for the family of the superintendant, a school-room, a sleeping apartment, in which is a long row of beds in the form of hammocks, a mess-room, and several workshops and tool-houses. The children, 90 in number, are dressed in a plain manner with blue linen blouses, and, to appearance, seemed a happy healthful collection of boys, mostly under twelve years of age. In answer to inquiries respecting the cause of their being inmates of the asylum, I learned that some were orphans or utterly destitute children picked up from the streets, others were boarded at the expense of parishes, while several were of that class of juveniles usually denominated "bad boys," and whose parents sent them to this place, with the hope of removing them from the society of vicious companions, and of having them methodically trained under the moral discipline of the asylum. The fee charged for board and education is 4s. 6d. per week. If the excellent rules for management be consistently and regularly acted upon, there can be no question as to the beneficial results. The system appeared to me to embrace much useful, healthy, and profitable industry, with correct moral nurture, as well as a fair share of ordinary school instruction. One of the most important features in the arrangement is the variety of industrial occupation, suitable to different capacities and tastes. There are a small printing-office with a press and types, a carpenter's shop with a bench and tools, a blacksmith's shed with an anvil, hammer, and bellows, and also shoemaking and tailoring departments, in which all the shoes and clothes are made and mended. Each workshop is under the charge of an aged artisan who acts as instructor in his craft. The printing-office is a neat little room, under the management of an old compositor; and here the boys print all the Reports for the institution, school tracts, and other papers. The out-of-door labour in the garden and field is conducted daily at fixed hours, except when the weather renders it unsuitable. Some of the small patches, cultivated by individual boys, did not appear to differ materially from what I had seen at Ealing. Along the margin of a rivulet which winds its way through the premises, the young cultivators are taught to rear and manage a stock of water-cresses.

The regular duties of the day commence as early as six o'clock; and after a certain period for school and breakfast, the boys form divisions under monitors, receive their tools from the tool-house, with instructions from the master, and proceed in an orderly manner to their different appointments; the printers to their office; the carpenters, blacksmiths, shoemakers, and tailors, to their shops, and the agriculturists to the field or gardens. At noon, the various divisions assemble, form a line, and proceed to the tool-house

Digitized by Google

where each boy deposits his spade, &c., in its place; a general monitor being responsible for all the instruments of labour being kept clean and in their proper places. The boys then wash themselves, are inspected by the master, instructed for a short time in gymnastic exercises, and afterwards go to dinner. For about an hour after dinner, they may amuse themselves in the play-ground, or in reading books from a small library kept for their use. At two o'clock, all again proceed to labour in the gardens or at their other employments, and afterwards receive lessons in school. Such is something like the routine of daily occupation. On Saturdays there is a general examination, and every child is washed in a tepid bath. During fine weather in summer, all are taught to swim in a neighbouring canal, under the eye of the master.

From this general outline of the scope and management of the institution, it will appear that the main object of its projectors and supporters has been the substitution of useful and profitable habits of industry for those of utter idleness and crime. It would only be a waste of time to enlarge upon the advantages which must follow from removing that host of young and wretched beings with which the streets of the metropolis are frequented, to an establishment like this, where, by a well-considered system of religious and moral discipline, they may be prepared for acting an honourable and useful part in society. That the Children's Friend Society has accomplished this desirable object, as far as its means would allow, I have no manner of doubt. The only serious obstacle it has had to encounter, has been the proper disposal of the children, after they have been fitted for an honest and active course of life. The practice has been to send them, with their own consent, and the consent of their parents, if these can be found, to the Cape of Good Hope, where, under the friendly care of a local committee, they have been bound apprentices to farmers, or others requiring their labours, and who become responsible for their correct and humane treatment. An attempt was some time ago made to fix upon the society the charge of harshness for thus expatriating the inmates of the asylum, and no small clamour was raised on the subject by some of the London newspapers. I believe that these accusations were both groundless and uncharitable. The society can evidently have no motive for preferring a location of the children in one or other of the colonies, to settling them at home, and I have no doubt that its directors would be exceedingly glad to be informed how or where they can comfortably and inexpensively dispose of them within the bounds of Britain. It is clear, however, that there is no prospect of attaining this useful piece of information; those who take upon themselves the easy negative duty of finding fault, being seldom inclined to give services of an active or positive quality. I sincerely wish that the Children's Friend Society may continue to be supported as it deserves; and that by an act of the legislature, both it and similar institutions may be enabled to extend their usefulness at home and in those colonial possessions which offer such boundless scope for human industry.

SHIPWRECK OF THE BRIG POLLY.

The brig Polly, of one hundred and thirty tons burden, sailed from Boston, with a cargo of lumber and provisions, on a voyage to Santa Croix, on the 12th of December 1811, under the command of Captain W. L. Cazneau, with a mate, four seamen, and a cook; Mr I. S. Hunt, and a negro girl of nine years of age, passengers. Nothing material happened until the 15th, when a violent gale came on from the south-east. The brig laboured very hard, which produced a leak, that so gained on the pumps as to sound nearly six feet; when about midnight the ship was thrown on her beam-ends, and Mr Hunt washed overboard. Not having any reason to hope for her righting, by much exertion the weather lanyards were cut away, the deck load having been before thrown over, and the lashings all gone; in about half an hour the mainmast went by the board, and soon after the foremast, when she righted, though full of water, a dreadful sea making a fair breach over her from stem to stern. In this situation the night wore away, and daylight found all alive except the male passenger; and upon close search the little girl was found clinging to the skylight of the cabin. The glass and grating of the skylight having gone away while the ship was on her beam ends, the little girl was drawn through the opening, but so much chilled that she survived only a few hours. Without fire, and exposed to all the violence of the weather, the crew remained about twelve days, when the cook, an Indian from Canton, near Boston, suggested the operation of rubbing two sticks together, which succeeded. Very fortunately, the camboose did not go overboard with the deck load; this was got to windward, a fire kindled, and some provisions cooked, which, except raw pork, were the first they had yet tasted. They now got up a barrel of pork, part of a barrel of beef, and one half-barrel of beef. A small pig had been saved alive, which they now dressed, not having any thing to feed it with. But at this time no apprehension was entertained of suffering for want of food, there being understood to be several barrels of meat stowed in the run, and upwards of one hundred under deck. Under this impression, the people used the provisions very imprudently, till they discovered that the stern post was gone; and the gale continuing for a long time, the barrels stove, and their contents were all lost for ever.

There happened to be a cask of water lashed on the quarter deck, which was saved, containing about thirty gallons—all the rest was lost. This lasted about eighteen days, when the crew were reduced to the necessity of subsisting upon what rain-water they could catch. At the end of forty days the provisions were exhausted, and absolute famine stared them in the face. The first victim was Mr Paddock, the mate, whose exquisite distress seemed to redouble the sufferings of his companions. He was a man of a robust constitution, who had spent his life in the bank-fishing, had suffered many hardships, and appeared the most capable of enduring privations and fatigue of any of the crew. In the meridian of life, being about thirty-five years old, it was reasonable to suppose that he would have been the last to have fallen a sacrifice to cold and hunger: but it was ordered otherwise; he became delirious, and death relieved him from his sufferings the fiftieth day of the shipwreck. During all this time the violence of the storm continued, and having nothing to screen them except a temporary kind of cabin, which they had built up of boards on the larboard side of the forecastle, they were kept almost continually drenched with sea-water. The next who fell a victim to these awful disasters was Howes, an active young man, who likewise died delirious, and in dreadful agony, six days after Paddock, being the fifty-sixth day of the wreck. It was soon perceived that this must shortly be the fate of all the survivors, if water was not procured. About this time, they were enabled to fish up the tea-kettle and one of the captain's pistols; and necessity suggested a plan of distillation. A piece of board was very nicely fitted to the mouth of the boiler, a small hole made in it, and the tea-kettle, bottom upwards, fixed to the upper side of the board; the pistol barrel was then fixed to the nose of the kettle, and kept cool by the constant application of cold water. This plan succeeded, and the survivors, without a doubt, owed their preservation to this simple expedient. But all the water that could be obtained by this very imperfect distillation, was an allowance for five men, barely sufficient to sustain life. The impression that there was meat enough under the deck, induced them to use every exertion to obtain it; but nothing could be got up except putrid pieces of bone, entirely divested of flesh. Their only sustenance now was barnacles gathered from the sides of the vessel, which were ate raw, that the distilling might not be interrupted. The next food which they obtained was a large shark, caught by means of a running bowline. This was a very great relief, and produced a second advantage; for, while they lived upon the shark, the barnacles were growing larger and more nutritive. They likewise found many small crabs among the sea-weed floating around the wreck, and which were very pleasant food. But, from the necessity of chewing them raw, and sucking out the nourishment, they brought on an obstinate costiveness, which became extremely painful, and was probably much exasperated by the want of water.

On the 15th of March, according to their computation, poor Moho, the cook, expired, evidently from want of water, though with much less distress than the others, and in the full exercise of his reason; he very devoutly prayed, and appeared perfectly resigned. The constant study of the commander of the crew was now directed to the improvement of their still, which was made much better by the addition of another pistol barrel, which was afterwards found. With this barrel they so far perfected the still, as to obtain eight junk bottles full of water in twenty-four hours. But from the death of Moho till the death of Johnson, which happened about the middle of April, they seemed to be denied every kind of food. The barnacles were all gone, and no friendly gale wafted to their side the sea-weed, from which they could obtain crabs or insects. It seemed as if all hope was gone for ever, and they had nothing before them but death, or the horrid alternative of eating the flesh of their dead companion. One expedient was left, which was to try to decoy a shark, if haply there might be one about the wreck, by part of the corpse of their shipmate! This last resource succeeded—they caught a large shark, and from that time had many fish, till their happy deliverance. Very fortunately, a cask of nails, which was on deck, lodged in the lea-scuppers while on their beam ends; with these they were enabled to fasten the shingles on their cabin, which, by constant improvement, had become much more commodious.

They had now drifted above two thousand miles, and were in latitude 28 degrees north, and longitude 13 degrees west, when, to their unspeakable joy, they saw three ships bearing down upon them. One of the ships hailed, which Captain Cazneau answered as well as his remaining strength would allow. The ship which hailed proved to be the Fame of Hull, Captain Featherstone, bound from Rio Janeiro home. It so happened that the three captains had dined together that day, and were all on board the Fame. These persons immediately sent a boat, which put an end to the dreadful thraldom of Captain Cazneau and Samuel Badger, the only surviving persons, who were received by these humane Englishmen with the greatest kindness. In this manner were these two miserable beings rescued from their perilous situation, after a series of distresses from December 15th till the 20th of June, a period of one hundred and ninety-one days! Every attention was paid to the sufferers that pity and fellow-feeling could dictate, on board the Fame. They were comforted, fed, and clothed, until the 9th of July, when they fell in with Captain Perkins of the brig Dromo, in the English channel, who generously perfected the work of goodness begun by the English captains, and safely carried this miserable remnant of the Polly's crew to their native land.

It is natural to inquire how they could float for so long a period upon the most frequented part of the Atlantic, without meeting a friendly sail to succour them! We blush to acknowledge that they were passed by more than a dozen ships, one of which came so nigh the poor mariners that they could distinctly see the people on deck and on the rigging looking at them; but, to the inexpressible disappointment of the helpless and miserable men, they stifled the dictates of compassion, hoisted sail, and cruelly abandoned them to their fate.—*From a collection of pieces.*

HINTS ON THE PREPARATION OF COFFEE.

The increase in the consumption of coffee that has taken place of late years, connected as it is with the temperance movement, gives considerable interest to this inquiry, which, in a chemical point of view, is also highly deserving of attention.

The art of preparing coffee for the table consists of three stages—roasting, grinding, and boiling; and these we shall treat individually.

The mode in which coffee is roasted, unimportant as it may appear, is of the greatest consequence as regards both the economical production and the flavour of the beverage. Common Jamaica coffee, which has been prepared in a proper manner, affords a decoction of greater strength and richer taste than the finest Mocha, where the roasting has been injudiciously conducted. These results will scarcely excite surprise when the explanation is pointed out. The qualities by which coffee is familiarly known as a beverage, are solely attributable to the effects of roasting; when the *raw* berry is boiled, the liquid obtained has neither aroma nor exhilarating influence. These properties are ascribable to a chemical change that takes place in this substance when exposed to the action of heat. Hence it is obvious that the value of coffee must essentially depend on the due *regulation* of the heat, to which its qualities as an article of diet entirely owe their existence.

The rules to be observed in coffee roasting, though calculated to be a source of great saving to the consumer, may be easily practised, and are referable to a few plain principles. The following are the objects of these rules:—

1. To roast the coffee *moderately* by the action of a gentle and uniform heat. 2. As far as practicable, to roast *all the particles* of the berry *equably*, and to heat the interior as well as the exterior portions of the kernels. 3. To prevent, as far as possible, the escape of the volatile aroma, which is liable to be dispersed by a high temperature. These objects are attained by means of the following directions, namely:—1. An equable heat is secured by using as a roaster a slowly conducting substance; 2. A more uniform roasting, by subdividing the berries; and, 3. Preservation of the aroma, by roasting in a partially closed vessel.

The first step in preparing coffee is to disperse by evaporation the water it contains. This is effected by placing it in a large iron pan over a very gentle fire, and keeping it stirring until it becomes of a yellow colour. This process is generally performed in a partially closed vessel, which prevents the free escape of the steam. But this is an erroneous practice, as it causes the coffee to be *scalded*, or partly boiled *in its own steam*, which is believed to be very injurious.

The next step is to pound the coffee into coarse fragments, *not too fine*, each berry being broken into about four or five pieces. There cannot be a doubt that coffee which has been thus subdivided, will be more rapidly and more perfectly prepared than when it is roasted *whole*. But consumers, generally speaking, will not take this trouble, but transfer the coffee at once from the drying-pan to the roasting machine, though it must be obvious that, if the *inner portions* of the berries are not perfectly roasted, there will be a considerable waste of the material.

The next stage is that of roasting, which must be conducted in a very different manner. Instead of an open pan, giving a free escape to the evaporation, a vessel must be used as *nearly closed* as it may be *without entirely confining* the volatile products. During the process of drying, nothing but watery vapour and a useless acid is given out, both of which it is desirable *to dissipate;* during roasting, on the other hand, *the fine aroma* of the coffee begins to be given out, and it is essential to *prevent its dispersion* as far as is consistent with the escape of other vapours.

The heat to which the coffee is exposed, should be gentle and uniform. With this view, Dr Donovan recommends that the roaster should be made of some substance which conducts heat slowly, and which therefore serves to moderate and intercept the sudden variations of temperature which occur in the fire by which it is heated. On this ground, glass is found to answer well, while the common iron roaster is less efficient, iron being *a good conductor*. But an apparatus is described by Dr Donovan, which unites the slow conducting powers of glass with the durability

Digitized by Google

of metal, and is very simple in its structure. It consists of two iron cylinders, one within the other, with the space of about half an inch between them. The air which occupies this space—air being a very bad conductor of heat—gives to this roaster the properties of a non-conductor, and protects the coffee, which is placed in the inner cylinder, from abrupt changes of heat.

The roaster is hung on an axis in a frame with a close cover, and a winch to turn it horizontally over the fire. The inner cylinder should never be filled more than one-third, as the coffee swells very much by heat.

The next point to determine is when the coffee has been sufficiently roasted. On this subject, it seems that the best test is the loss of weight. If it be found to weigh one-fifth less than it did before it was put into the roasting-pan, it may be considered to be well prepared. Change of colour to a bright chocolate is sometimes adopted as a proof of complete roasting, but it is not to be relied upon. The retailers are in the habit of roasting their coffee too little, because by the loss of weight their profit is diminished: hence the consumer is a loser in two ways; he has to pay a higher price from the heaviness of the article, and the coffee being imperfectly roasted, he must use more of it to obtain a decoction of the proper strength. This shows the importance of preparing coffee *at home* to those who would use it with economy. Moreover, it is to be observed, that roasted coffee is much injured by keeping even for a short time; it is better, therefore, to roast it only in small quantities as it is wanted for use.

The next stage is that of grinding. The coffee should be ground immediately before it is used: the common practice of keeping it ready ground is a wasteful one. If exposed to the air, much of its aroma is dispersed, and even if kept in close vessels, it seems that it is apt to undergo internal decomposition: the popular idea that it remains uninjured if kept in a closely corked bottle, is therefore a fallacy.

The coffee should be ground as fine as possible, as thereby its essential properties are more easily extracted by boiling: the importance of shortening the time of boiling will appear more clearly from what follows.

Coffee, when roasted, contains two substances—one highly volatile, which gives to it its peculiar aromatic flavour, and a pungent and exhilarating principle of a more fixed nature. This makes the process of boiling a matter of some nicety. If the coffee be boiled too long, the volatile aroma is dispersed; if boiled only for a short time, the pungent or stimulating property is only partially extracted. A medium must therefore be adopted, and the coffee must be acted upon for a sufficient period to extract a reasonable portion of the latter, without a serious waste of the former quality. It is for this reason that grinding the coffee fine acts beneficially, as the fixed stimulating property may in that case be extracted with less boiling, and may therefore be united in a higher degree with the aroma. If the berries are reduced to a very fine powder, a very trifling boiling will extract all their virtues.

The clearing of coffee is as carefully attended to by consumers as proper boiling; indeed, the "porcolator" which is in common use may be said in a great measure to sacrifice the latter object to the former. This instrument, which was invented by Count Rumford, is nothing else than a strainer, or filter, on which the coffee is placed; boiling water is poured upon it, and filtered through the coffee and the strainer. The liquid thus obtained is cleared indeed; but as the coffee has not been boiled, but merely subjected *to infusion*, only a portion of its strength is extracted, and before the filtering is complete, the beverage has *become cooled*. These objections have led to artificial methods of clearing, such as the addition of fish-skin, isinglass, &c. Latterly, there have been several mechanical inventions for preparing coffee speedily for the table—among others we may mention "Platow's Patent Automaton Coffee Urn," and the "Pneumatic Coffee-pot;" but of the actual value of these we are unable to pronounce any opinion. It must always be recollected that extreme speed may be procured at a sacrifice of flavour, and this must be carefully guarded against. The liquid extract of coffee evidently requires a certain length of time to *mellow* before it be fit for use in an agreeable form.

From the foregoing explanations, it will appear that the art of preparing coffee for the breakfast-table is not to be understood without some attention. But, on the other hand, the degree of attention required is so trifling, that it would assuredly be well bestowed, especially considering the interesting nature of the subject. Far more toil and time are daily given to other culinary processes which probably merit them less, and much more trouble is spent, both by the higher and lower classes, on mere trifles, which contribute less both to their enjoyment and recreation than studies of this nature; whilst on the processes of the distiller—pernicious as they are for the most part in their results to the best interests of society—capital and scientific skill have been profusely employed. The subject of these remarks can scarcely be considered as less deserving of investigation; regard being paid to the ends to which it may be rendered subservient, the coffee berry is no ignoble topic of investigation. Ministering as it does to the luxuries of the rich, it seems destined to fulfil the higher office of contributing to the reformation of the poor, by presenting to them a beverage, which, though free from intoxicating qualities, enables them more readily to dispense with ardent spirits. The more palatable and inviting this beverage is rendered, the more efficient will it prove as an auxiliary in the great cause of moral reformation. With these views, it may be remarked that the preceding processes do not appear to be either too abstruse for the understanding, or too costly for the means, even of the very humblest classes. No two things can differ more widely from each other than coffee as it is usually drank by the poor, and the same substance prepared with care and good sense.

But there is another advantage, and that by no means a trifling one, which would result could the "good wives" of our labouring classes be induced to give a little of their time to acquiring skill in coffee-making. Not only would their husbands drink a better beverage, but they would drink it *at home*. The liquid which is served out to the labouring classes in the common coffee-shops in the metropolis, is a coarse and repulsive draught, extracted from bad coffee still worse prepared—deprived of all the aroma it ever possessed by protracted boiling upon a large scale, and probably rendered extremely unwholesome by the excess of the bitter principle. Were our housewives to learn to prepare a more palatable and healthy beverage by their own firesides, they would be abundantly repaid. They would add another link to the chain which binds men to their homes; they would materially diminish the temptations to intemperance to which their partners are exposed; and would thereby render no trivial service to their husbands, their children, and themselves.

TERROR OF PUBLIC OPINION.

Every traveller who returns from the United States of America expresses his astonishment at the remarkable *tyranny of public opinion*, which by universal consent prevails in that country. No one, it appears, dares to take a decided stand against popular sentiment, no matter how absurd or false it may chance to be; so that, while no nation on the face of the earth is so *civilly free*, none is so *socially enslaved*. Orville Dewey, in an excellent work, entitled "Moral Views of Commerce, Society, and Politics" (New York, 1838), exposes and denounces this peculiarity in the social condition of his countrymen, in the following well-set terms:—

"The greatest of all dangers here, as I conceive, is that of general pusillanimity, of moral cowardice, of losing a proper and manly independence of character. I think that I see something of this in our very manners, in the hesitation, the indirectness, the cautious and circuitous modes of speech, the eye asking assent before the tongue can finish its sentence. I think that in other countries you oftener meet with men who stand manfully and boldly up, and deliver their opinion without asking or caring what you or others think about it. It may, sometimes, be rough and harsh; but, at any rate, it is independent. Observe, too, in how many relations, political, religious, and social, a man is liable to find bondage instead of freedom. If he wants office, he must attach himself to a party, and then his eyes must be sealed in blindness, and his lips in silence, towards all the faults of his party. He *may* have his eyes open, and he may see much to condemn, but he must *say* nothing. If he edits a newspaper, his choice is often between bondage and beggary. That may actually be the choice, though he does not know it. He may be so complete a slave that he does not feel the chain. His passions may be so enlisted in the cause of his party, as to blind his discrimination and destroy all comprehension and capability of independence. So it may be with the religious partisan. He knows, perhaps, that there are errors in his adopted creed, faults in his sect, fanaticism and extravagance in some of its measures. See if you get him to speak of them. See if you can get him to breathe a whisper of doubt. No; he is always believing. He has a convenient phrase that covers up all difficulties in his creed. He believes it 'for *substance* of doctrine.' Or, if he is a layman, perhaps he does not believe it at all. What, then, is his conclusion? Why, he has friends who do believe it; and he does not wish to offend them. And so he goes on, listening to what he does not believe; outwardly acquiescing, inwardly remonstrating; the slave of fear or fashion, never daring, not once in his life daring, to speak out openly the thought that is in him. Nay, he sees men suffering under the weight of public reprobation for the open espousal of the very opinions *he* holds, and he has never the generosity or manliness to say, '*I* think so *too*.' Nay, more; by the course he pursues he is made to cast his stone—or he holds it in his hand at least, and lets another arm apply the force necessary to cast it—at the very men who are suffering a sort of martyrdom *for his own faith!*

I am not now advocating any particular opinions. I am only advocating a manly freedom in the expression of those opinions which a man does entertain. And if those opinions are unpopular, I hold that in this country there is so much the more need of an open and independent expression of them. Look at the case most seriously, I beseech you. What is ever to correct the faults of society, if no one lifts his voice against them—if every one goes on openly doing what every one privately complains of—if all shrink behind the faint-hearted apology, that it would be over-bold in them to attempt any reform? What is to rebuke political time-serving, religious fanaticism, or social folly, if no one has the independence to protest against them? Look at it in a larger view. What barrier is there against the universal despotism of public opinion in this country, but individual freedom? Who is to stand up against it here but the possessor of that lofty independence? There is no king, no sultan, no noble, no privileged class; nobody else to stand against it. If you yield this point, if you are for ever making compromises, if all men do this, if the entire policy of private life here is to escape opposition and reproach, every thing will be swept beneath the popular wave. There will be no individuality, no hardihood, no high and stern resolve, no self-subsistence, no fearless dignity, no glorious manhood of mind, left among us. The holy heritage of our fathers' virtues will be trodden under foot by their unworthy children. *They* feared not to stand up against kings and nobles, and parliament and people. Better did they account it, that their lonely bark should sweep the wide sea in freedom—happier were they when their sail swelled to the storm of winter—than to be slaves in palaces of ease. Sweeter to their ear was the music of the gale that shrieked in their broken cordage, than the voice at home that said, 'Submit, and you shall have rest.' And, when they reached this wild shore, and built their altar, and knelt upon the frozen snow and the flinty rock to worship, they built that altar to freedom, to individual freedom, to freedom of conscience and opinion; and their noble prayer was, that their children might be thus free. Let their sons remember the prayer of their extremity, and the great bequest which their magnanimity has left us. Let them beware how they become entangled again in the yoke of bondage. Let the ministers at God's altar, let the guardians of the press, let all sober and thinking men, speak the thought that is in them. It is better to speak honest *error* than to suppress conscious truth. Smothered error is more dangerous than that which flames and burns out. But do I speak of danger? I know of but one thing safe in the universe, and that is truth. And I know of but one way to truth for an individual mind, and that is unfettered thought. And I know but one path for the multitude to truth, and that is thought, freely expressed. Make of truth itself an altar of slavery, and guard it about with a mysterious shrine—bind thought as a victim upon it, and let the passions of the prejudiced multitude minister fuel—and you sacrifice upon that accursed altar the hopes of the world!"

It would be a matter of curious inquiry how far the foregoing observations applied to the state of society in this country.

AN OBSCURE MAN OF GENIUS.

We believe there are few country towns in Scotland in which may not be found individuals pursuing a humble profession, but possessing abilities of the first order, skilful in some intricate art, and yet whose reputation can scarcely be said to be known ten miles distant from their home. We have happened to know several of these "geniuses," as they are ordinarily termed—one had an extraordinary knack at making and mending locks, another made fire-arms of first-rate quality, a third was good at cuckoo clocks, a fourth was an extraordinary adept at cork-screws, and so on with several others. We find a notice of a self-taught genius of this stamp in the Falkirk Magazine, a periodical of considerable merit (1827), conducted by a young man of ability, Mr Robert Keir—himself an example of modest merit, but who was prematurely removed from this earthly scene.

"John Gibson, as this man of genius was named, was a native of Jedburgh. At an early age he was bound apprentice to a clock and watch maker of that place. After the expiry of his apprenticeship, he came to Kelso and began business for himself. Being in a delicate state of health, he resided for some time in the neighbourhood of the town for the benefit of free air, and soon began to be known as a singular character. Many ignorant and superstitious people were persuaded that he was possessed of the second sight. He was therefore frequently consulted as an oracle about future destinies, and also about stolen goods. His responses in general gave great satisfaction. He predicted for the most part with accuracy, and concealed pilfered articles were often recovered by his sagacity. In a short time, however, the superiority of his genius was known and admired by many intelligent gentlemen. He now took up his residence in Kelso, where he made many clocks upon improved principles, which are now regarded as mechanical curiosities. Optics had long been his favourite study. He now commenced optician, and constructed reflecting telescopes, which he sold at from two to five guineas. He also constructed achromatic prospects on the plan of Mr Dolland, and in a short time surpassed the great inventor. He made one of these prospects, mounted in the most beautiful style, for Sir John Peter, then envoy at the court of St Petersburg. The magnifying power was 150; and the diameter of the object glass was six inches. The instrument, with all its apparatus, cost 100 guineas. When Sir John returned to Russia, he presented it to the Empress Catherine, who was so charmed with it, that she sent Mr Gibson an urgent invitation to come to St Petersburg, with a promise of patronage. The delicate state of his health obliged him to decline her generous

Digitized by Google

offer. Mr Gibson next exercised his ingenuity by making a prospect of the same size and price for the Duke of Roxburghe, through which, in a clear day, a sparrow could be seen on the roof of Berwick steeple, at a distance of twenty-four miles.

Mr Gibson made the Irish pipes upon an improved plan, on which he played with exquisite skill and taste. His tone and execution were reckoned no way inferior to those of the most celebrated pipers. He was a self-taught musician, played upon a great variety of instruments, and never received a lesson from a master. Mr Short's reflecting telescope, in the observatory, Calton Hill, Edinburgh, had been rendered useless, owing to a spot of rust upon the larger speculum. No optician in the metropolis would undertake to remove it. A gentleman from Kelso recommended Mr Gibson, who successfully removed the rusty spot, and at the same time greatly improved the instrument, for which he received a remuneration of fifty guineas.

Mr Gibson, some years before his death, visited London, and received a very kind reception from Mr Dolland, who humorously told him that 'his ears had been stunned for some time past with the fame of a wild fellow about the Cheviot Hills, who excelled all the opticians in London in making achromatic prospects, and that he (Mr Dolland) was glad to see the artist.'

As a mechanic, in the execution of any piece of work, Mr Gibson was unrivalled. He melted and refined the glass for his own purposes. In reasoning upon optical and astronomical topics, few were a match for him. In his actions he was sharp, in his conceptions quick. He possessed a most retentive memory, understood every subject at first sight, and made such progress in the Latin language by his own application alone, that he could translate with ease Lewenhoeck's 'Arcana Naturæ,' an author of whom he was extremely fond. This ingenious man died in September 1795."

LAURA BRIDGMAN—A DEAF, DUMB, AND BLIND GIRL.

In a lately published Report of the Massachusetts Institution for the Blind, there appear some interesting details respecting a pupil, named Laura Bridgman, who was placed in the establishment a few years since, in the deplorable condition of being blind, deaf, and dumb. She had been in this state of deprivation ever since she was little more than a year old, and therefore possessed no knowledge whatever except what it had been possible to communicate through the senses of feeling and taste. Being introduced to the school of the institution, a methodic plan of instruction was commenced by means of the tangible alphabet for the blind, which led to the most agreeable and surprising results. The extent of her intellectual and moral advancement will be learned from the following extract from the Report:—

"The intellectual improvement of this interesting being, and the progress she has made in expressing her ideas, are truly gratifying. She uses the manual alphabet of the deaf mutes with great facility and great rapidity; she has increased her vocabulary so as to comprehend the names of all common objects; she uses adjectives expressive of positive qualities, such as *hard, soft, sweet, sour*, &c.; verbs expressive of action, as *give, take, ride, run*, &c., in the present, past, and future tense; she connects adjectives with nouns to express their qualities; she introduces verbs into sentences, and connects them by conjunctions; for instance, a gentleman having given her an apple, she said, *Man give Laura sweet apple.*

She can count to high numbers; she can add and subtract small numbers.

But the most gratifying acquirement which she has made, and the one which has given her the most delight, is the power of *writing a legible hand*, and expressing her thoughts upon paper; she writes with a pencil in a grooved line, and makes her letters clear and distinct.

She was sadly puzzled at first to know the meaning of the process to which she was subjected; but, when the idea dawned upon her mind, that by means of it she could convey intelligence to her mother, her delight was unbounded. She applied herself with great diligence, and in a few months actually wrote a legible letter to her mother, in which she conveyed information of her being well, and of her coming home in ten weeks. It was, indeed, only the skeleton of a letter, but still it expressed in legible characters a vague outline of the ideas which were passing in her mind. She was very impatient to have *the man* carry this letter, for she supposed that the utmost limit of the Post-Office department was to employ a man to run backward and forward between our institution and the different towns where the pupils live, to fetch and carry letters.

She has improved very much in personal appearance as well as in intellect; her countenance beams with intelligence; she is always active at study, work, or play; she never repines, and most of her time is gay and frolicsome.

She is now very expert with her needle, she knits very easily, and can make twine bags and various fancy articles very prettily. She is very docile, has a quick sense of propriety, dresses herself with great neatness, and is always correct in her deportment. In short, it would be difficult to find a child in the possession of all her senses, and the enjoyment of the advantages that wealth and parental love can bestow, who is more contented and cheerful, or to whom existence seems a greater blessing, than it does to this bereaved creature, for whom the sun has no light, the air no sound, and the flowers no colour or smell."

INSCRIPTION FOR A CEMETERY.

BY SWYNFEN JERVIS.

The grave, whatever thy degree,
Thy final resting-place must be.
What matters it, if few or more
The years which our frail nature bore?—
If we upon the roll of fame
Left an imperishable name,
Or in some silent, safe retreat
Escaped the turmoil and the heat,
The stir, the struggle, and the strife,
That make the sum of human life?
Of all the family of man,
Since first the sons of earth began
To make this glorious world a stage
For rapine, blood, and lawless rage,
How little can be said beside,
But that they lived, and loved, and died!
Of this be certain: 'tis the doom
Of all, within the quiet tomb
To find, life's dangerous quicksands past,
A shelter and a home at last!

CUTTINGS FROM AMERICAN NEWSPAPERS.

Eloquence.—The following is an extract from a speech delivered by a member of the Indiana legislature, on a bill to encourage the killing of wolves, which in sublimity has seldom been surpassed:—

"Mr Speaker—The wolf is the most ferocious animal that prowls in our western prairies, or runs at large in the forests of Indiana. He creeps from his lurking place at the hour of midnight, when all nature is locked in the silent embraces of Morpheus; and ere the portals of the east are unbarred, or bright Phœbus rises in all his golden majesty, whole litters of pigs are destroyed."

William Tell outdone.—We learn from a paper, published in Northern Pennsylvania, that some time since a feat was performed in Ridgebury, Bradford county, which throws that of William Tell into the shade. A man named Lathorp Baldwin, with a rifle, shot an apple from the head of Thomas Fox, at eighteen yards' distance. There was no cap on Fox's head, his hair was combed down smooth, and the apple was a small one. Both were somewhat in their cups.—*Buffalo Commercial Advertiser.*

Virginia Justice.—A fellow in Virginia, who was ducked by a parcel of boys for whipping his wife, sued them for damages. The boys were very properly sentenced to duck him again.

Unproductive Land.—A New Jersey paper states that there are lands in that state which will not support three whippoor-wills to an acre, any way you can fix it, under the best cultivation. He of the Boston Times says that these must be like some lands in New Hampshire, which the owners are obliged to fence, in order to keep their cows from going on and starving!

A Distinction.—A dry-goods dealer in Bangor, had, by his conduct, obtained the name of "the little rascal." Being asked why this appellation had been given him, he replied, "To distinguish me from the rest of my neighbours, who are all *great rascals!*"

Yankee Dinners.—Baked beans, it is said, form now the only decidedly fashionable meal for Sabbath noon in "Bosting." Whether they wash them down with any thing stronger than "lasses and water," the informant said not; but it seems to be not altogether unlikely, as a minister in "them parts" has computed that he "has preached regularly every Sabbath afternoon to fifty-five bushels and three pecks of baked beans, while their owners were mostly asleep."

Industry and Perseverance.—We have the information from undoubted authority, that an individual in Braintree has bottomed, during the past year, 950 pairs of men's thick boots, 150 pairs of boys' thick boots, and 80 pairs of brogans; read two weekly newspapers, with pamphlets, magazines, &c., besides 21,000 pages of the Library. We boldly ask, who has done better?—*Quincy Patriot.*

The Benefit of Advertising.—A merchant in one of our northern cities lately put an advertisement in a paper, headed "Boy wanted." The next morning he found a bandbox on his door step, with this inscription on the top, "How will this one answer?" On opening it, he found a nice, fat, chubby-looking specimen of the article he *wanted*, warmly done up in flannel!

Mississippi.—A very able writer in the *Piney Woods Planter*, states the interest on banking capital paid by the people of Mississippi at 16,128,000 dollars per annum. His enumeration of the various classes of inhabitants is singular. He says there are in the state thirty-five thousand free white male citizens over twenty-one years of age—of this number he estimates that one thousand are engaged in *mixing liquor*, seven hundred and fifty in *making paper money*, about one thousand in the laudable occupation of *pleading law*, expounding the Scriptures, manufacturing pills, and teaching the young idea how to shoot—the aggregate number of idlers is estimated at three thousand six hundred and forty, leaving thirty-one thousand three hundred and sixty persons engaged in agriculture, commerce, and the mechanic arts.

Yankee Perseverance.—The following little anecdote, which we cut from the *Boston Post*, would have done honour to Sam Slick, had he been the subject of it:—

An itinerant map-seller went into a merchant's counting-room near our office the other day, and asked the occupant if he wished to purchase a map. "No," was the tart reply. "Will you look at one?" "No; I have more of my own than I have time to examine?" "Will you allow me to look at yours, then?" "Yes; there they hang." "Well, while I am looking at yours, I'll just unroll mine—that, you know, won't hurt any body." So the map-vendor displayed several of his best at full length upon the counter, and then quietly commenced looking at the merchant's which hung against the wall. After making a few observations about some curious water-falls, caves, &c., at places which he traced out upon the map before him, he managed to engage the merchant's attention, and at last referred to his own map, lying on the counter, for a more perfect illustration of his description, and finally so much interested the auditor that he bought three different maps, at six dollars each, of the pedlar, and very politely asked him to call again when he got out a new edition.

A Traveller.—As we were about leaving the hotel at Philadelphia this morning, there seemed some delay from a passenger in the third story. Pretty soon, we heard a sharp altercation up stairs, followed by the appearance of a short fat man with a red face, who preceded a negre with an armful of boots. The short fat man hobbled to the bar; and in a sort of ominous whisper, as though he took some credit for not being in a towering passion, said,

"Landlord, where are MY BOOTS?"

"Why, really, sir, I—— what number were they?"

"What has that to do with it?" said the fat man, beginning to get excited. "I don't know the number; I believe they were 8, with low heels and pegged."

"Ah, you mistake; what is the number of your room?"

"Forty-five."

"And did you put the number on your boots, when you took them off?"

"What have I to do with marking boots? Do you think I carry a bottle of ink in my pocket to prevent my boots being stolen?"

"But there was a piece of chalk on the stand where you took them off?"

"A piece of thunder and lightning!" said the other. "I'll tell you what, landlord, this wont do. The simple question is, Where are my boots? I took them off in this house, and you are responsible for them. That's law all over the world."

"Carriage waiting," said the driver.

"Let it wait," said the fat man. "Suppose I can go without my boots?"

"Here be one pair that wern't marked," said the black; "are them um?"

"Them um, you rascal, why they are an inch too short, and the heels are two inches high."

"Carriage waiting, and the boat will leave if I wait any longer," shouted the driver, while we in the carriage were all urging him to start.

The fat man gasped for breath. "Landlord, I again ask, WHERE ARE MY BOOTS?"

"Why, really, sir, I"——

"Go, or not?" said the driver.

The short man seized the unmarked boots, and strained and pulled till he got them on, and, groaning as though his feet were in a vice,

"I'll tell you what it is, landlord, I call all these people to witness"——

"Carriage starting," said the bystanders.

The fat man started too, and was just getting into the coach, when the black touched his coat tail, saying, "Remember the servant, sir."

"Yes," said the other, turning round and laying his cane over the waiter's head, "take that, and that, and try and see if you can remember *me*, and my boots, too."

After we reached the boat, and for a long time, the fat man seemed lost in a reverie, looking at his new boots. I once heard him mutter, "After all, if I get the heels out off, they wont be so very uncomfortable, and mine did leak a little."

Thus may we draw comfort from the worst of ills, for what is worse than losing one's boots when the carriage is waiting, and the boat about to start?

THE HOSTILITY OF POPULAR PREJUDICE TO THE DEVELOPEMENT OF SCIENCE.

There is no great improvement which has ever been proposed or effected, no discovery of art or science, whether affecting the physical or mental condition of mankind, but has met with opposition to its developement; if, therefore, those discoveries which the last century has produced, and which touch so lightly the habits and manners of the million, have, before reaching their present perfection, had to struggle not only with the imperfect knowledge which the first discoverers had of their principle, but the active opposition and lazy ignorance of the multitude, with how much more fervour has that opposition been displayed when science has dared to meddle with the ignorance of antiquated custom! We all remember when the illumination of the streets by gas was commenced, the fears, the apprehensions that were raised—the very watchmen, who seldom thought at all, trod the pavement with fear and terror. It was known that tubes of inflammable and poisonous air were carried under the streets; it was prognosticated that London would be lost, as the agent of fire and pestilence was brought to every man's door.—*Polytechnic Journal.*

NUMBER 447. SATURDAY, AUGUST 22, 1840. PRICE THREE HALFPENCE.

DOWN-TAKINGS.

ONE day, passing that rare kind of mansion in Britain, a nunnery, we were surprised, and then amused to think that we should have been surprised, at observing a shop-porter unloading a barrow covered with bottle-baskets at the gate, and carrying the said baskets into the house, evidently for the use of the inmates. We are so much accustomed to think of nuns as beings refined away from all ordinary habits, that to be informed that they occasionally drink porter, comes upon the mind with a very peculiar effect. Our reason instantly rallies to make the admission that nuns, as well as other human beings, may relish a draught of porter, and may as innocently indulge in the gratification. But, nevertheless, the idea of their getting a weekly supply of this article from a shop, is inconsistent with all our common ideas of a set of females who have put themselves so much aloof from their kind, and who have been figures in the phantasmagoria of fiction since ever they existed; and we cannot deny that they descend at once, through the force of this simple circumstance, to the level of common mortals. In short, it is a *down-taking*.

Similar down-takings result when we learn any very homely or facetious circumstance respecting historical persons who are usually regarded with romantic feelings. Mary Queen of Scots is a personage in this predicament, to which her beauty, her rank, and her misfortunes all alike have contributed. Not to speak of the serious errors imputed to this princess, there are some memorabilia of her private life that have a strange effect, as relative to a being so embalmed in the romance of history. It is curious, for instance, to learn that, when reigning in Scotland, she occasionally dressed herself in men's clothes, and frolicked about amongst her attendants; that on one occasion, on a Monday following Easter, she put on the garb of a citizen's wife, and, causing her attendants to do the same, went through the streets of Edinburgh on foot, begging from every man they met a contribution towards a supper which was to take place in the evening;* and that, when she wrote not in French, it was in broad Scotch. In a letter addressed by her to her ambassador in France, giving an account of Darnley's murder, she says, the house was laid in ruins, "to the very grund-stane." A more extended specimen of her native Doric may be given, from her instructions to an ambassador who was commissioned to excuse her marriage with Bothwell to the English queen:—"Ye sall grund yow upon the conditioun and stait of ws and oure realme, declarand how we wer destitut of ane husband, our realme not throuchlie purgit of the factiounis and conspiraceis that of lang tyme hes continewit thairin, quhilk, occurring sa frequentlie, had alreddie in a maner sa weryit and brokin ws, that be oure selfe we were not abill of ony lang continewance to sustene the pynes and travell in oure awin persoun, quilkis were requisite for repressing of the insolence and seditioun of oure rebellious subjectis, being, as is knawin, a peopill als factious amangis thameselfis and as fassious for the governour as any uthir natioun in Europe; and that, for thair satisfactioun, quhilk could not suffer ws lang to continew in the stait of widoheid, movit be thair prayeris and requeist, it behuvit ws to yield unto ane mariage or uther."† A whimsical anecdote is told of Mary in a note upon an old manuscript book in the Advocates' Library. This book is entitled the "Rolment of Courts," and is a treatise on the laws, constitutions, and antiquities of Scotland, the author being one Habakkuk Bisset. The note, which is in a different hand from the book, states that Bisset's father was caterer to Queen Mary, and that, when about to have his child baptised, he took the liberty to ask the queen to assign a name. She, being about to go to mass, said she would open the Bible when in church, and the first name which should strike her eye, she would assign it for a name to the infant. The first name she cast up, was that of the prophet Habakkuk, which was accordingly bestowed upon the future author of the "Rolment of Courts." This proceeding was simply odd or droll; and were ordinary persons only concerned, it would pass merely as such. But, told of a queen so lustrous in beauty, and whose memory is so steeped in tears, it has a down-taking effect. Mary must have laughed when she told her caterer the result of her research; and that she should have even laughed, takes her back into the fields of common life. Sometimes the chronicling of a merely minute and unimportant detail of the life of such a person, has the effect we speak of. It is known, for instance, that, the morning after her husband Darnley was blown up, she took an egg for her breakfast in bed, with the curtains closed. It is not perhaps too much to say, that to relate such circumstances of an exalted personage, avails more to *take them down*, than bringing home to them serious guilt would in all cases do.

In the case of any one who is addicted to any kind of mental extravagance, the effect of a little home truth has a remarkably down-taking effect. Beau Tibbs, in the midst of his fine speeches about his house and his views (which Bill Squash the Creole so much appreciated), is drawn from his altitudes in an instant, when his blundering Scotch servant discloses the awful fact that his wife is washing his "twa sarks" at a neighbour's house, the said neighbour having taken a vow never again to lend her tub. So was a village politician, whom we once knew, seriously taken down, when, in the midst of a fireside harangue before some neighbours on the national debt, his sober-minded wife insinuated, "Ah, John, I wish you would mind your own debt!" Domestic cruelties like these should be considered as indictable offences. It is related of a penurious nobleman, who used to sell the fruit from his garden and the milk from his cows, but at the same time entertained the vainest ideas respecting his rank, that he one day accosted a little girl who was tripping through his park with a pipkin, asking her what she carried, who were her parents, and so on. At length he said, "You seem a very nice little girl, and I shall therefore do you a great honour (kissing her). Now, my dear, you may hereafter tell your children to hand it down to your grandchildren, who will again transmit it to succeeding generations, that you were once kissed by the Earl of ——." It must have been a rich treat to any bystander, when the girl looked archly up, and said, "You always take the penny for the milk, though." This was a splendid *down-take*. A still better occurred to a recruiting sergeant, who, with a gaily ribboned party, was endeavouring to astonish the senses of a crowd of rustics at a village fair. The trumpets had flourished; the drums had been beaten; a brilliant procession, with drawn blades and glancing cockades, had marched through the street; and it was then the duty of the sergeant to stand up and make a rhodomontade speech on the delights of a soldier's life—on glory, patriotism, and plunder; the great bounty given to deserving young men, the prospect of promotion, and his majesty's munificent pension to the old and wounded. Our sergeant had just concluded one of his most brilliant orations; the crowd of rustics were standing round, gaping with admiration of what they saw and heard, and almost believing in the promises held out to them; and the sergeant was already in idea leading a score of stout recruits to be sworn in at the neighbouring depôt—when Andrew Gemmell, an old soldier, and well-known beggar, who, in tattered guise, was standing close behind the orator, reared aloft on his staff his miserable meal-bags, the ensigns of his profession, and, in a voice of profound derision, exclaimed, "Behold the end o't!" The sergeant was in a moment *taken down*; the feelings of the crowd were turned into a new channel, and the glittering party beat a retreat amidst universal laughter.

Such effects may be likened to that of the squirt of cold water introduced into the cylinder of the steam-engine; and in this light they show the remarkable analogy which exists between moral and physical things. When we see the chop-fallen appearance of an enthusiast after a *down-take*, we cannot reasonably doubt that in his secret nature something not much less palpable than steam has been condensed by the application, leaving his mind in a totally different state from what it was in a minute before.

It is on this principle of ludicrous contrast that the success of such poems as Don Juan chiefly depends. A solemn or elevated thing is introduced, and is treated for some time in appropriate terms, when suddenly at last comes in some mean or familiar imagery, to *take down* what has just been said. For example—

> "They mourn'd for those who perish'd in the cutter,
> And likewise for the biscuits, casks, and butter."

The principles of down-taking, which we are here endeavouring to treat philosophically, are instinctively understood and practised by many individuals, and are sometimes applied with great force against the aspiring and ambitious, as well as against the enthusiastic. There is, indeed, a well-recognised body of persons in the social world, to whom the appellation of down-takers may be given, being a sect or variety of the ancient fraternity of dampers, who, we believe, have been treated of by former essayists. The down-takers are a heroic and disinterested little party, who, like knight-errants of old, devote themselves, at great personal hazard, to the duty of keeping down vain and aspiring persons at a certain fixed point of moderation. It is a most useful employment, and, both for its gallantry and its good effects, ought to be handsomely acknowledged. It tells particularly well against any one who is guilty of family pride. Here the plan is to bring into view some family circumstance respecting which the reverse of pride will be felt. For example:—An Earl of Glencairn, in the last century, married the daughter of a rustic musician, named M'Guire, who had become almost by accident possessed of a large fortune. At a county ball, his lordship's local rival, the Earl of Cassillis, remarked to him that his father-in-law would have given them good music, if he had been still alive. This was the down-take direct; but it was well retorted, for Glencairn instantly replied, "Yes, my lord, and I remember one of his best tunes was the Gipsy Laddie"—the air of a ballad descriptive of the disgraceful elopement of a former Countess of Cassillis. This, therefore, is a double instance of the down-take of family pride. We need scarcely remark, that for this branch of the art, a memory well stored with genealogies is absolutely necessary. Another broad mark for the down-takers is the vanity of those who have risen from a lowly condition in life, and are so foolish as to think themselves entitled to spend their earnings according to their own taste. All the left-behind open after such a case full-cry. Has any topping trades-

man built for himself a goodly mansion out of town, it is immediately christened "his folly." Even a poor tailor cannot get up a smart box in the suburbs with a green door and green palings, but it at once becomes Cabbage Hall all the world over. A house built by a successful milliner near Edinburgh about sixty years ago, was called Lappet Hall. By such means the pride of the constructors is effectually taken down, for not even Aladdin's palace could maintain its dignity against a nickname. It is really pleasant to observe the interest which so large a part of mankind thus take in keeping one frail member of their corps in order. It shows how we are, as Wordsworth says,

> "——— each bound to each
> In cords of mutual sympathy."

When honours, moreover, befall any one of us, it rarely happens that there is not some one, like the figure in the ancient triumphs, to remind the elevated, if not elated individual, that he is mortal. From his own order, from the ranks of his own profession, some one is sure to start forth, and hold up the mirror of humility before his eyes. It is told of a certain pope of old times, that, having been a peasant in his youth, he preserved the clouted shoes he had worn in that character, and had them hung up in his hall of audience to remind him of what he had once been. This must have been a most superfluous proceeding, for if the conclave of cardinals was composed of ordinary human beings, there could not fail to be at least one honest soul amongst them disposed to take upon himself the duty of keeping down his holiness's pride.

Upon the whole, there is little reason to believe that there ever will be a short-coming of the sect of down-takers amongst us, for, while jealousy or envy shall exist, while selfishness shall repine at another's good, and pretension with difficulty bear any rival, the spirit which animates the party must continue to flourish.

POPULAR INFORMATION ON POLITICAL ECONOMY.

SEVENTH ARTICLE.—PROFITS.

EVERY addition made to the wealth of the community, must, according to a division generally adopted by economists, make its first appearance in one of three forms—wages of labour, rent of land, or profits of stock. The former two of these have been already considered: it is here proposed to bestow a few remarks on the last.

As we shall show more fully afterwards, wages and profits are often so closely blended with each other, that the public lose sight of the distinction between them. It may here be remarked, that what is properly called profit is the net return which is brought to the employer of a sum of money in any particular capacity, after the sum itself is replaced, and all expenses connected with the speculation are paid. Interest of money might at first present itself to the mind as purely answering this definition; but though interest is generated by profits, and in a great measure regulated by their amount, the elements of the two are distinct. In as far as respects each separate transaction, interest is generally fixed, while profits always depend on contingencies. Interest is a sum paid for the use of money which the borrower obliges himself to repay, and which he continues under the obligation to restore, though he himself should lose it. The person, however, who puts money out of his hand to make profit, stands the whole risk himself of losing not only the profit, but the principal sum invested.

As the fund out of which profits are made is something over and above that laid out in the speculation by which it is cleared, the greater the value of the produce the greater is the amount of the profit, and the greater the proportional amount of produce the greater is its value. The chance of obtaining this greater proportional amount, is the inducement which keeps the world in perpetual progress. A, by laying out L.100, can produce a ton of a certain commodity, making a profit of L.10: B finds out a way by which he can produce a quarter of a ton more of it by the same outlay, worth in the market L.27, 10s. more. If the demand were to continue correspondent, and no one were to follow B's example, he might thus continue making 27½ per cent; but in the general case, the example of a new and successful investment is so expeditiously followed, that the person who first chalks it out may be prompted to modify his price, and consequently his profits, that he may get a considerable portion of the produce disposed of before he is outbid by rivals. The recourse to machinery, and other means of increasing produce in this country, is caused by the action of this principle; and it is by similar motives that the American extends his dominions and has recourse to new fields. In the former instance, however, there is a restriction, as we shall presently see, of a very serious nature, which does not apply—at least with the same force—to the latter. If all capital could be invested in operations, the productiveness of which would continue to increase as rapidly as that of manufactures has done, it is difficult to say at what rate profits, and consequently capital, and consequently the means of employment, would increase. Before more particularly considering the drag which restricts this state of progression, let us notice briefly another element which affects the amount of profit.

As the produce of the capital employed, after paying rent and taxes, has to be divided between the capitalist and his workmen, the more the latter get, the less there will be for the former, or the greater is the proportion paid in wages, the less is that realised in profits. The word *proportion* is here necessary to prevent misunderstanding, for it very generally happens that when the wages of the labourer are large, the profits of the employer are so too. A state of society where the wages of the workman are large, although at the expense of the capitalists, must be looked upon as a good one, if it be permanent. It shows that the labourers have not multiplied so as ruinously to underbid each other, and that the capitalists too are content, as, if they were not, they would take their money out of the field. In the competition with the capitalist, indeed, sympathy will always be in favour of the labourer, for it must be recollected that it is open to the moneyed man to become a workman if he is discontented with the profits of his capital, but it is not open to the labourer to become an employer. Such a state of matters, however, is unfortunately apt to be of short duration, for it is by the increase of capital laid up from profits that the fund to employ the additional number of labourers tempted into the market by high wages can be employed; and not only does smallness of profit prevent this accumulation from taking place, but it induces the owner to withdraw the capital already invested. When the rise of wages is factitious, caused by combinations or otherwise, so as to reduce the profit from some particular investment below that of others, from that employment capital immediately takes wing, and wages depart with it.

Let us now look to the principal circumstance which, as we before hinted, stands in the way of an increase of profits, and tends to their reduction. This is a reduction in the amount of produce, when compared with that of the capital laid out. It is pretty clear that in manufactures this is not developed, nor can we easily imagine it to be so in that branch of industry. But manufactures are not the only branch of industry—there is agriculture. It is the peculiarity of that method of investment, where the soil employed is limited in extent (as in Great Britain), that the greater the amount laid out on it beyond a certain line, the less in proportion is the return. One tract of land will produce 100 quarters of grain for an outlay of L.200, but when there is a call for a more sterile district to be taken into cultivation, it may take an expenditure of L.300 to produce from it the same crop. Under the head of rent, the circumstance out of which a call would arise for such an inferior description of soil being brought under the plough, was specially considered, and it was shown that the difference in the cost of production goes as rent to the landlord. Rent is thus increased, while the produce—the fund out of which wages and profit come—is reduced. But it may be said there are other investments besides that of agriculture, and as profits always find a level, the money engaged in farming operations will be withdrawn when the profits are reduced. It is true that profits find a level, but the level in this case is unfortunately that of agriculture, to which manufacturing profits will be dragged down. In fact, by the circumstances which render it necessary to have recourse to a less productive agriculture, these profits are already reduced. The people must all have food. The more their numbers are increased, through the operation of manufactures, the greater is the quantity of the food required; and when it becomes necessary to resort to poorer lands, the greater must be the proportion of the population employed in producing that food. The people having in this manner to pay more for their food (or to bestow a greater proportion of their labour in producing it), can afford less for other commodities; and thus it is, that when the price of food rises by the pressure upon it, manufacturing profits sink, and the capital that would be employed in this branch of industry is directed towards the production of food. As the produce, after replacing advances, is the fund out of which wages as well as profits are paid, the labourer's remuneration will sink under such a state of circumstances, but not in the same ratio with profits. The labourer must have enough to preserve life, otherwise he will cease to produce, but the profit of the capitalist may be indefinitely reduced. The operation of this principle will depend entirely on the extent to which the expensive production of food must be had recourse to, and consequently profits, as well as wages, will be reduced by any system which tends to increase this expense by prohibiting recourse to a cheap produce. It has been observed, that in America this drag on profit is almost unknown, for there the trouble of spreading itself abroad is all the inconvenience that the population has had to undergo in increasing its supply of food. In this country, the evils of a pressure have been materially mitigated by improvements in husbandry, which have in many cases made the poorer lands produce grain at no greater cost than was necessary in the case of richer soils half a century ago. Experience has, however, taught us that it is not possible for the effect of agricultural improvements to keep pace with a population increasing at the rate of very nearly 1000 daily.

Taxes may create an incidental check on profits, and it is chiefly in this form that they can impoverish a country; for the simple handing over of money from one portion of the community to another, will not make the whole poorer. Their effect in this direction, however, is not so powerful as it would naturally at first appear. The importer who pays customs, and the manufacturer who pays excise, have each just so much more outlay, and must charge their customers accordingly. It is pretty clear, however, that an expenditure such as this, on which in general only average profit can be made, covering so large a proportion of the cost of a commodity, must be an impediment to enterprise. The duties on some commodities are nine times as much as their prime cost. If a man have L.1000 to embark in a trade, knowing that on L.900 of this, which he spent in duties, he cannot have more than average profits, he has not the same inducement to open up new channels as if he had the spending of the whole L.1000 according to his own discretion. The bonding system, it may be observed, has reduced the pressure of taxation in this direction to a very great extent. Taking taxes in the mass, the greater part of them probably press on profits—a circumstance which, it would appear, has received no better demonstration than this, that it is difficult to see what other fund they can be paid from but that which remains over after meeting the cost of production. It is a doctrine strongly maintained by political economists, that rent does not affect profits. It is undoubtedly the case, that in any given country the rate of profit made by the farmer who cultivates rich land at a high rent, will not be less than that of him who employs his capital on poor soil at a small rent. It is pretty clear, however, from the considerations brought forward above, that the same circumstances which increase rent decrease profits. The increase of the pressure on food, which causes a recourse to the poorer lands, while it decreases the produce to be shared between the capitalist and the labourer, increases the rent on the better soils. There is a point, however, at which this increase will stop, and retrogression commence; but for a fuller explanation of this, we refer back the reader to our article on Rent.

We hinted above, that profits, and the wages of labour, were often so intimately combined, that in many cases the public do not distinguish between them. When a man is engaged in active business from morning to night—has created a branch of remunerating business to himself, and keeps it in active existence—we cannot well say that those returns, which would decrease or disappear in the hands of an indolent and unskilful proprietor, are wholly the profits of stock; a great portion must frequently constitute wages of labour—but what particular proportion should be so allocated, it might be difficult to determine. The price, indeed, which the use of mere money will bring, is the current market interest of the time; and whatever is gained above this, must, in the general case, be set down either to wages of labour (varying according to the amount of skill and energy of the employer), or indemnification for risk. When the large returns sometimes obtained by merchants are contemplated, the latter is a consideration frequently overlooked. If the remuneration for toil, however, is to be set down as a compensation for the bodily pain which accompanies its developement, the profits made in commercial speculations might be not unfairly estimated as a recompense for the mental anxiety which they call forth. Among all the mental agonies which the ambition, pride, and passions of mankind, with their corresponding disappointments and sympathies, create, we believe few are more intense than that of the merchant, who, having lived in opulence and liberal splendour in the bosom of an affectionate family, and feeling that the moderate incomes of a multitude of trusting friends are entwined with his apparently prosperous fortunes, knows that a sudden breath of fortune is likely to hurl the whole fabric of his prosperity to the earth. The wages of labour, as we have just now viewed them, are, in general, inextricably mingled with the remuneration of risk, for it is owing to the speculator's consciousness of his own ability to counteract the causes of danger, that it is generally braved. The trade of a publisher may be cited as an instance; the profits are sometimes great, but the risk is equally so. It is a profession in which the rash, ignorant, or indolent man will soon ruin himself, however great his capital; and the profits realised by which, are generally the reward of great discrimination and industry.

As respects wages, strictly so called, or remuneration for labour, their amount doubtless depends on the simple circumstance of demand and supply—not by any means on their actual or intrinsic value. There is, generally speaking, only a certain portion of profits in trade which can be distributed in the form of wages, and the fewer among whom the distribution is to be made, the larger will be the share of each person. Yet, the share which each person receives from the mass is often governed by very capricious circumstances, in relation to the peculiar tastes of society. An actress will receive a wage of L.100 per night, and realise in the aggregate a much larger revenue than the President of the United States; and so on with a thousand other cases. In these, as in all ordinary engagements, the scarcity of the article, and the great demand for it, are the true causes of the highness of price. The correction of the public taste may ultimately place remuneration for labour more

Digitized by Google

upon a par, but that is a matter requiring the consideration of the moralist.

In those retail trades, in which small articles are sold, the wages of labour form a large proportion of the return generally attributed to profits. The profession of a druggist is a striking instance. He often sells his medicines at eight, ten, or twelve times the price he pays for them. In doling them out, however, in pence and halfpence worth, he bestows a considerable portion of his time, and he has likewise to give his skill. In other retail trades, when the business increases, it is easy to multiply the hands who distribute at the counter; but the chemist can only employ shopmen who possess a certain portion of his own skill, so that with the increase of his business, he cannot in general diminish the rate of profit. The profits thus made by retailers—and, indeed, almost all profits paid by immediate consumers—form a very common subject of complaint among buyers. "How unreasonable! how extortionate!" is the feeling of the purchaser who has paid a penny for an ounce of medicine, which it is afterwards discovered that the manufacturer disposes of wholesale at a rate equivalent to half a farthing. But the prudent person who so complains, forgets that the vicinity and convenience of the shop, the weighing and compounding of the article, and the skill to make it correspond with the physician's prescription, are all paid for with the penny, along with the original cost of the article and the profit on that cost. Yet uninterrupted as is the outcry against the profits, as they are termed, of retailers, the profits must be got, or the retailers could not exist; indeed, those who so grumble are the persons who hold out the inducement to the supply of their demands. They want the convenience of the retail system, and they must pay for it. The existence of the feeling in question has some of the usual effects of false notions regarding the ordinary business of the world. Men are here, as in other cases, cheated by an appeal to their selfishness. The greatest temptation that a tradesman can hold out to his customers is, that he makes no profit—positively none; for when the smallest possible sum is placed to that account, there is a lurking suspicion that all is not right—nay, some are so charitable to the infirmities of their neighbours, as to hold out to their admiring eyes a continuous series of losses, and "sacrifices" are made to bargain-hunters which might propitiate a pantheon. "I lose by every bunch," said the old woman regarding her matches, "but I sell a great many of 'em." If the public would consider the tradesman's integrity condemned by his propagation of a self-evident falsehood, the general dishonesty of the world would be one degree abated.

A CHINESE STORY.

[The annals of China give the following history as true, and we ought not to take it for romance. It has been translated from the Chinese into French by the late R. P. Dentrecolles. In China, it may be mentioned that each town prints whatever occurs, of a singular character, in its district. They take especial care to collect accounts of the lives of individuals distinguished by arms or by letters, or who have sustained an integrity beyond the common standard. These memoirs are generally very instructive. They embody maxims calculated to improve the manners, and always point to the practice of some virtue. How many Christian writers might profitably imitate such a method, and propose to themselves the task of conveying instruction as the constant object of their works! Since the greatest demand of the present day is the demand for novelty, perhaps we may add, that, within the limits of Europe, we shall scarcely find a greater novelty than a real Chinese story. Ours wears an air of strangeness; but for that it is all the better. It is well to bear in mind the observation of an ingenious Frenchman, that the Chinese write their histories with a simplicity unexampled in the rest of Asia.]

THERE once lived at Nankin three brothers, Lin the Diamond, Lin the Treasure, and Lin the Pearl. Lin the Diamond, who was the eldest, was enjoying a life of the purest happiness with Ouang, his wife, when compelled by the most pressing concerns to undertake a long journey. As they were many years without having news of him, they began to believe him dead; and Lin the Treasure, who thereby became the master of his house, assured Ouang of it so positively, that she allowed herself at last to be persuaded, and resorted to deep mourning.

Lin the Treasure had a bad heart; he was capable of the most unworthy actions. "I shall doubt no more of it," said he; "my brother is dead, and I am the master. His wife is young and handsome; her parents are distant, and she cannot implore their aid. I must constrain her incessantly to marry: I shall get money out of it."

He communicated his design to Yang, his wife, and commanded her to set about a proper negotiation for marriage. Ouang rejected afar off all the propositions that were made her. She protested that she would remain a widow, and thereby honour the memory of her beloved husband. Lin the Pearl, her other brother-in-law, confirmed her in this resolution. Thus all the artifices that could be employed proved unsuccessful. And as it entered time after time into her mind, that it was by no means certain whether her husband were dead, she resolved on that point to inform herself. It was this that determined her to entreat Lin the Pearl to betake himself into the province of Chang-si, to ascertain if indeed she had had the misfortune to lose her husband, and, in that case, to fetch her his precious remains.

Lin the Treasure, on the departure of his younger brother, became more ardent in his pursuits. He was in a rage for gambling during several days, and in this had been so unlucky, that he knew not where to find the money to have his revenge. In the embarrassment in which he found himself, he accidentally encountered a merchant of Kiang-si who had lost his wife, and who was in search of another. Lin the Treasure embraced the occasion, and promised him his sister-in-law. The merchant accepted the proposition, after having taken the precaution to inform himself secretly whether the person proposed to him were young and handsome. When thus assured, he produced thirty taëls* to conclude the bargain.

Lin the Treasure, having received this sum, said to the merchant, "I ought to apprise you that my sister-in-law is proud, disdainful, and extremely fastidious. She will make many obstacles when she comes to quit the house, and you will have much trouble in prevailing with her. Observe, then, what you ought to do. This evening, at nightfall, have a couch, adorned according to custom, and some good bearers: come noiselessly, and present yourself at our door. The lady who will appear, with a head-dress of mourning, is my sister-in-law; speak not a word *to her*, and listen not to what she would say *to you*; but seize on her at once; cast her into the couch, conduct her on board your bark, and make sail." This expedient pleased the merchant very much, and the execution appeared to him easy.

Lin the Treasure, having returned to the house, dissembled himself in presence of his sister-in-law, in order that she might suspect nothing of the project he had formed; but so soon as she had withdrawn, he imparted it in confidence to his wife; and indicating the lovely Ouang by a spiteful jest, "It must be," said he, "that this two-footed merchandise go forth, this night, of our house. As to that, I trouble myself little. I wish not, however, to find myself present at that scene, and I shall go abroad for some moments. Towards nightfall, some people, well accompanied, will come to our gate, and carry her off in a well-closed couch"——

He would have proceeded, when he was all at once arrested by the noise which he heard. It was his sister-in-law, who was passing near the chamber window. Lin the Treasure thereupon hurried out by another door; and the precipitation of his retreat permitted him not to add all the circumstances of the abduction, and especially the mark of the *head-dress of mourning*, by which the Lady Ouang was to have been distinguished. This happened, without doubt, by an especial providence from Heaven.

Ouang easily perceived that the noise which she had made nigh to the window, had obliged Lin the Treasure abruptly to break off the conversation; but she had heard enough of it to be unable to doubt concerning the evil intentions of her brother-in-law. She entered the chamber, and approaching Yang-sang, to her declared her apprehensions. "My dear sister," said she to her, "you behold an unhappy widow, who is knit to you by the closest ties of a friendship which was ever most sincere. It is by this friendship that I implore you to avow to me frankly if my brother-in-law still persists in wishing to force me to a marriage which will tend to my confusion!"

At this demand, Yang at first appeared disconcerted, and blushed; but speedily assuming a countenance more assured, "What think you of, my sister!" said she; "and what imaginations do you put into your mind! If it were proposed to re-marry you, do you believe we should be very much embarrassed by it? Eh! What good to throw one's self in the water, before the vessel is threatened with shipwreck!"

As soon as the Lady Ouang heard this proverb, *drawn from the vessel*, she better comprehended the meaning of the secret discourse of her brother-in-law. She broke out into lamentations and sighs, and abandoning herself to grief, shut herself up in her chamber, where she wept, groaned, and bewailed herself. "Oh! I am most wretched," cried she; "I knew not who may become my husband. Lin the Pearl, my brother-in-law, and my friend, on whom I could have depended, is on a journey; my father, my mother, my parents, are far distant from this place; if this affair be precipitated, how shall I be able to apprise them? I have no aid to expect from our neighbours; Lin the Treasure is a terror to the whole district, and they know that he is capable of the greatest villanies. Unfortunate being that I am, I shall never escape his snares! If I fall not into them to-day, I shall to-morrow, or within a very short time. Every thing well considered, let me close this painful existence; let me die in good time—that will be much better than enduring a thousand and a thousand deaths: and what is my life, if not one continual death!"

The trepidations of this unhappy lady lasted till night, and after much reflection, she confirmed herself in the determination to die, rather than fall into the hands of her ravishers. As soon as the sun disappeared from the horizon, and the obscurity of night supplied his place, she shut herself up, without light, in her chamber, and cried, "Almighty Tien, avenge me, protect me!" Her distresses and desolation were so great, that she threw off her head-dress, tore her hair, and yielding to the wildest grief, she fell, very faint and exhausted, rudely on the floor. The noise of this disaster caused Dame Yang to rush towards the spot, and, finding the door secured, she forced it with a bar. As she was without light, in entering the chamber she entangled her feet in the dress of the Lady Ouang, and tumbled backwards. This mishap threw her head-dress to a considerable distance, and the fright with which she was seized rendered her for several moments insensible. As soon as she had regained her consciousness, she raised herself, went in search of a light, and returned to the chamber, where she found the Lady Ouang still extended immoveably on the ground.

At the instant, when she would have procured assistance, she heard some one strike softly on the door of the house. She doubted not that it was the merchant of Kiang-si, who was coming in search of the wife whom he had purchased. She wished to hasten to his reception, and introduce him into the chamber of her sister-in-law. Her eagerness, and the scruple which she had against showing herself without a head-dress, caused her to pick up the mourning one of the Lady Ouang, which she found at hand.

It was truly the merchant of Kiang-si, who had come to carry off the lady promised him. He had brought a wedding-litter, decorated with silken streamers, with festoons of flowers, and innumerable beautiful lamps. It was surrounded by domestics bearing lighted torches, and a band of musicians with flutes and hautboys. All this retinue was drawn up in the street, without the instruments being played or noise being made. The merchant himself was detached from it, and had struck gently at the gate. But having found it ajar, he entered the house, with some of those who held the flambeaux to show the way.

As soon as the Dame Yang appeared, the merchant noticed upon her the mourning head-dress, which was the token assigned him; and being, besides, charmed with her appearance, and some glimpses of her countenance, threw himself upon her, like a hungry gled upon a little bird. The people in his train hastened up, carried off the lady, and enclosed her in the litter, which was all prepared for her reception. She made a good outcry that they deceived themselves, that it was not she whom they sought: the flourish of instruments was instantly heard, and drowned her voice, whilst the litter-bearers stepped out with the more good will, in order to transport her to the bark.

During this time the Lady Ouang had come to herself, and recovered her recollection. The great disturbance which she heard at the door of the house renewed her alarms, and caused her mortal uneasiness. But as she perceived that the sound of the instruments, and that confusion of voice and of music which had struck up all at once, were farther off every moment, she re-assured herself; and in a few minutes she regained courage, and went forth to see what was ado.

The Lady Ouang having called many times in vain for her sister-in-law, comprehended that the merchant had deceived himself, and that he had carried off her whom he did not seek; but she dreaded some troublesome vicissitude when Lin the Treasure should become aware of the mistake. She shut herself up in her chamber, gathered up the head-trimmings, the ear-rings, and the *black** head-dress which lay upon the ground, and she thereupon dreamed of courting a brief repose; but it was impossible for her to close an eye all the night long.

At the break of day she arose, washed her face; and whilst she searched for her head-dress of mourning to put on, she heard a great noise at the house-door. Some one beat it rudely, and called "Open, now!" It was Lin the Treasure, whose voice she recognised. Her part was speedily taken: she left him to knock there without response. He swore, he stamped, he roared enough to make himself hoarse. At length the Lady Ouang drew near to the door, and keeping behind without opening it, "Who is it that knocks," said she, "and makes such a noise?" Lin the Treasure, who distinguished well enough the voice of his sister-in-law, was seized with extreme consternation. His confusion was unbounded, perceiving that she refused to open. He had recourse to an expedient which succeeded with him. "Sister-in-law," said he, "good and happy news! Lin the Pearl, my younger brother, is returned, and our elder brother enjoys perfect health. Open quickly!"

At this agreeable intelligence, the Lady Ouang, hastily assuming the *black* head-dress, which had been left by Dame Yang, opened with eagerness, expecting to find her good brother-in-law Lin the Pearl; but in vain her eyes sought him; she perceived only Lin the Treasure. The latter proceeded to his apartment; but not finding his wife there, and remarking a black head-dress on the head of his sister-in-law, he then feared his misfortune. "Ha! where then is your sister-in-law?" said he to Ouang. "You should know better than I," replied that lady, "since it is you who have contrived this nice intrigue." "But," replied Lin the Treasure, "why wear you not the *white* head-dress? Have you laid aside your mourning?" The Lady Ouang had the condescension to relate to him what had occurred in his absence.

Scarcely had she finished, when Lin the Treasure beat his breast passionately, and worked himself up to despair. Regaining his temper, at length, by slow degrees, "I have still one expedient in misfortune," said he to himself, "and that is to sell my sister-in-law. With the money she will fetch me, shall I buy another wife, and none shall know I have been unhappy enough to sell my own." He had gambled all the preceding night, and lost the thirty taëls which

* About six shillings sterling.

* In Europe, mourning is generally black; in China and Japan it is, on the contrary, white, as amongst the ancient Spartan and Roman ladies.

Digitized by Google

he had received of the merchant of Kiang-si, who was already very far away with his new spouse.

He was preparing to sally forth to go negotiating this new bargain, when he observed at the door four or five individuals, who pressed for admission. These were his elder brother Lin the Diamond, his younger brother Lin the Pearl, his nephew Hieul, and two domestics who were bearing the luggage. Lin the Treasure, confounded at this sight, had not the face to endure their presence; he evaded them as quickly as he could by the back door, and disappeared like lightning.

The Lady Ouang, transported with joy, hastened to receive her dear husband. But how incredibly lively were her emotions when she perceived a son, whom she loved with exceeding tenderness, and had long given up as lost. She scarce could recognise him, he had grown so tall and handsome. "Ah! by what good fortune," cried she, "have you recovered this dear child, whom I had believed lost?"

Lin the Diamond gave his wife a recital of his whole adventures, and she, in turn, related to him at large all the indignities to which Lin the Treasure had subjected her, and the extremities to which he had reduced her.

Lin the Diamond, on this occasion, accorded to his virtuous spouse the just praises which her fidelity merited. He exclaimed, in concluding, "If, by a blind passion for wealth, I had retained two hundred taëls which I found by chance, how should I have been able to retrace our dear son? If avarice had prevented me from devoting twenty taëls to succour those who had suffered shipwreck, my dear brother should have perished in the waves, and I have seen him no more. If, by an unexpected adventure, I had not encountered that excellent brother, how should I have timeously discovered the trouble and confusion which reigned in my house! Without that, my dear wife, we should never have seen ourselves re-united, our family should have been dismembered and plunged into affliction. This is all the effect of a particular providence of Heaven, which has brought about these several events. As for my other brother—a brother most unnatural—who unwittingly has sold his own wife, he has justly drawn on himself the evils that overwhelm him. The mighty Tien treats men according to their deserts. They need not believe that they can escape his justice. We may hereby learn how profitable it is to practise virtue; it is this that renders, day by day, a house more prosperous!"

Some time thereafter, the young Hieul returned to Yangtcheu, to espouse the lovely daughter of Tchin. This marriage was celebrated with great tokens of rejoicing, and to the mutual satisfaction of both families. He conducted his wife to Vousi. Their nuptials were exceedingly happy; and Heaven blessed them with a numerous offspring. They beheld a crowd of little grandsons, many of whom ultimately advanced themselves in the path of letters, and arrived at posts of the highest trust. It is thus that this family became illustrious.

INSTANCES OF SELF-IMPROVEMENT IN SAILORS.*

THERE are many cases on record of individuals who, even with scarcely any other education than what they contrived to give themselves while serving in subordinate and laborious situations in the camp or on shipboard, have attained to great familiarity with books, and sometimes risen to considerable literary or scientific distinction. The celebrated English navigator, Dampier, although he had been some time at school before he left his native country, yet went to sea at so early an age, that considering he for a long time led a vagabond and lawless life, he must have very soon forgotten every thing he had been taught, if he had not, in the midst of all his wild adventures, taken great pains both to retain and extend his knowledge. That he must have done so, is evident from the accounts of his different voyages which he afterwards published. We have few works of the kind more vigorously or graphically written than these volumes; and they contain abundant evidences of a scientific and philosophical knowledge of no ordinary extent and exactness. Along with Dampier's, we may mention an older name, that of John Davis, the discoverer of the well-known strait leading into Baffin's Bay. Davis also went to sea when quite a boy, and must have acquired all his knowledge both of science and of the art of composition while engaged among the duties of his profession. Yet we not only have from his pen accounts of several of his voyages, but also a treatise on the general hydrography of the earth. He was the inventor, besides, of a quadrant for taking the sun's altitude at sea. Robert Drury, too, who wrote an account of the Island of Madagascar, and of his strange adventures there, deserves to be remembered when we are making mention of authors bred at sea. Drury was only fourteen when he set out on his voyage in a vessel proceeding to India, and he was shipwrecked in returning home on the island we have mentioned, where he remained in a species of captivity for fifteen years; so that when he at last contrived to make his escape, he had almost forgotten his native language. He afterwards, however, set about writing an account of his life—a task which he accomplished whilst acting in the humble capacity of a porter at the India House. The work is composed in a plain but sensible style, and contains many interesting details respecting the manners of the natives of Madagascar. It is perhaps somewhat better for having been compressed by one of the friends of the author, whose original manuscript is said to have extended to eight hundred large folio pages.

Falconer, the author of the "The Shipwreck," as is generally known, spent his life, from childhood, at sea. He was probably born in one of the small towns in the county of Fife which border the Frith of Forth, but nothing is very certainly ascertained either as to his native place or his parentage. Nor has any account been given of how he acquired the elements of education, with the exception of a report that he found an instructor in a person of the name of Campbell, a man of some literary taste and acquirements, who happened to be purser in one of the vessels in which young Falconer sailed. However this may be, Falconer appeared as an author at a very early age, having been only, it is said, in his twenty-first year when he gave to the world his first production, a poem on the death of Frederick, Prince of Wales, the father of George III. He was ten or twelve years older when he published his "Shipwreck," which is said to be founded in a great measure on the personal adventures of the author. Falconer did not permit the success of his poetical efforts to withdraw him from his profession, in which, having now transferred himself from the merchant service to the navy, he continued to rise steadily till he was appointed purser of a man of war. Sometime after attaining this promotion, he published the other work by which he is chiefly known, his "Universal Marine Dictionary," which was very favourably received, and is still a standard work. He had previously to this written several other poetical pieces on temporary subjects, which have long been forgotten. Shortly after the publication of his Dictionary, he sailed for Bengal as purser of the frigate Aurora. This vessel, however, was never heard of after she passed the Cape of Good Hope, having in all probability foundered at sea.

Giordani, an Italian engineer and mathematician of the seventeenth century, was originally a common soldier on board one of the Pope's galleys. In this situation his capacity and good conduct attracted the attention of his admiral, and as a reward he was promoted to the post of purser of one of the vessels. It was his appointment to this situation which first formed his mind to study. Having accounts to keep, he soon found how necessary it was that he should know something of arithmetic, of which he was till then quite ignorant; and he determined therefore to teach himself the science, which it is said he did without assistance. By pursuing his studies from this commencement, he eventually acquired considerable reputation as a mathematician; and, having published several able works, was appointed at last to a professorship in the Sapienza College at Rome. Giordani died in the year 1711.

Mr John Fransham, who died at Norwich in 1810, was altogether one of the most eccentric characters to be found in the list of self-educated persons. His name suggests itself to us here from the circumstance of his having passed part of his early life as a common soldier. He had been originally apprenticed to a cooper, with whom he remained for about two years, and it was in this situation that he taught himself mathematics. But although he obtained the situation of clerk to an attorney, his restless disposition would not allow him to remain at his desk; and after wandering for some time about the country, he enlisted in the army, where, however, they did not keep him long, finding him quite unfit for service. Indeed, it was by this time become pretty evident that his mind was not a little deranged—a matter which he shortly after put beyond doubt by renouncing Christianity and making a formal profession of paganism. Although he published several works, however, in support of his peculiar theology, and in other respects conducted himself with great eccentricity, he contrived to maintain himself by teaching mathematics, in which occupation he is said to have displayed very considerable ability. He resided and took pupils for some years in London. Somewhat similar to Fransham's history is that of Mr John Oswald, who is said to have taught himself Greek, Latin, and Arabic, while holding a lieutenant's commission in a regiment of infantry in India. He afterwards returned to England, where he published a succession of poetical and political pamphlets, making himself remarkable at the same time by various singularities of behaviour and opinions, and especially by a rigid abstinence from animal food, and a professional predilection for the religious doctrines of the Brahmins. When the revolution broke out in France, Oswald went over to that country, and entered the service of the republic, in which he obtained the rank of colonel. He was at length killed in battle.

Columbus, one of the greatest men that ever lived—if it be grand ideas grandly realised that constitute greatness—while leading the life of a seaman, not only pursued assiduously the studies more particularly relating to his profession, rendering himself the most accomplished geographer and astronomer of his time, but kept up that acquaintance which he had begun at school with the different branches of elegant literature. We are told that he was even wont to amuse himself by the composition of Latin verses. It was at sea, too, that Cook acquired those high scientific, and, we may even add, literary accomplishments, of which he showed himself to be possessed. The parents of the celebrated navigator were poor peasants, and all the school education he ever had was a little reading, writing, and arithmetic, for which he was indebted to the liberality of a gentleman in the neighbourhood. He was apprenticed, at the age of thirteen, to a shopkeeper in the small town of Snaith, near Newcastle; and it was while in this situation that he was first seized with a passion for the sea. After some time, he prevailed upon his master to give up his indentures, and entered as one of the crew of a coasting vessel engaged in the coal trade. He continued in this service till he had reached his twenty-seventh year, when he exchanged it for that of the navy, in which he soon distinguished himself so greatly, that he was three or four years after appointed master of the Mercury, which belonged to a squadron then proceeding to attack Quebec. Here he first showed the proficiency he had already made in the scientific part of his profession, by an admirable chart which he constructed and published of the river St Lawrence. He felt, however, the disadvantages of his ignorance of mathematics; and, while still assisting in the hostile operations carrying on against the French on the coast of North America, he applied himself to the study of Euclid's Elements, which he soon mastered, and then began that of astronomy. A year or two after this, while again stationed in the same quarter, he communicated to the Royal Society an account of a solar eclipse which took place on the 5th of August 1766: deducing from it, with great exactness and skill, the longitude of the place of observation; and his paper was printed in the Philosophical Transactions. He had now completely established his reputation as an able and scientific seaman; and it having been determined by government, at the request of the Royal Society, to send out qualified persons to the South Sea, to observe the approaching transit of the planet Venus over the sun's disc—a phenomenon which promised several interesting results to astronomy—Cook was appointed to the command of the Endeavour, the vessel fitted out for that purpose. He conducted this expedition, which, in addition to the accomplishment of its principal purpose, was productive of a large accession of important geographical discoveries, with the most consummate skill and ability; and was, the year after he returned home, appointed to the command of a second vessel destined for the same regions, but having in view more particularly the determination of the question as to the existence of a southern polar continent. He was nearly three years absent upon this voyage; but so admirable were the methods he adopted for preserving the health of his seamen, that he reached home with the loss of only one man from his whole crew. Having addressed a paper to the Royal Society upon this subject, he was not only chosen a member of that learned body, but was farther rewarded by having the Copley gold medal voted to him for his experiments. Of this second voyage he drew up the account himself, and it has been universally esteemed a model in that species of writing.

All our readers know the termination of Cook's distinguished career. His third voyage, undertaken for the discovery of a passage from the Atlantic to the Pacific, along the north coast of America, although unsuccessful in reference to this object, was fertile in geographical discoveries, and equally honourable with those by which it had been preceded, to the sagacity, good management, and scientific skill of its unfortunate commander. The death of Captain Cook took place at Owyhee, in a sudden tumult of the natives of that island, on the 14th of February 1779. The news of the event was received with general lamentation, not only in his own country but throughout Europe. Pensions were bestowed on his widow and three sons by the government; the Royal Society ordered a medal to be struck in commemoration of him; his eulogy was pronounced in the Florentine Academy; and various other honours were paid to his memory, both by public bodies and individuals. Thus, by his own persevering efforts, did this great man raise himself from the lowest obscurity to a reputation wide as the world itself, and certain to last as long as the age in which he flourished shall be remembered by history. But better still than even all this fame—than either the honours he received while living, or those which, when he was no more, his country and mankind bestowed upon his memory—he had exalted himself in the scale of moral and intellectual being; had won for himself, by his unwearied striving, a new and nobler nature, and taken a high place among the instructors and benefactors of mankind. This alone is true happiness—the one worthy end of human exertion or ambition—the only satisfying reward of all labour, and study, and virtuous activity or endurance.

To the example of Cook, if it were necessary, we might add those of others of his countrymen, who, since his time, have shown, in like manner, the possibility of uniting the cultivation of literature and science to the most zealous performance of the duties of the same laborious profession. For instance, Vancouver was a sailor formed under Cook; and to him we owe an interesting and ably written account of the voyage which he made round the world, in 1790, and the four following years. Lieutenant Flinders commanded the expedition sent out in 1801, to survey the coast of New Holland, and afterwards published an

* We have found this article in a printed collection of anonymous pieces, and are therefore unable to name its author.

Digitized by Google

account of his voyage, accompanied by a volume of charts, which are considered as placing the author in the highest rank of modern hydrographers. Nor ought we here to forget the late Lord Collingwood, second in command to Nelson at Trafalgar, and, in all respects, a man of first-rate merit, who, although he never sent any production to the press, has been proved by his correspondence, published since his death, to have been in reality one of the best of writers. Yet he was only thirteen when he first entered the navy, and during the remainder of his life he was scarcely ever ashore—circumstances which used to make his acquaintances wonder not a little where he got his style. He had always, however, been fond of reading and the study of elegant literature; and he found that even a life at sea afforded him many opportunities of indulging his tastes for these enjoyments.

OCCASIONAL NOTES.

REMUNERATION TO TEACHERS.

A NUMBER of years ago, when Stouber, the predecessor of Oberlin as pastor of a district in Switzerland, arrived at Walbach, he asked to see the school-house. He was conducted to a poor cottage, where he saw a crowd of children doing nothing. He inquired for the master, and a feeble old man was shown, lying on a bed in a corner. "What do you teach?" said he. "Nothing," was the answer. "How happens that?" "I know nothing." "What are you here for, then?" "Because I had grown too old and too weak to tend the pigs of the village any longer, and they put a younger and abler man in my place, and sent me here to take charge of the children."

We are not exactly so stupid in this country as the inhabitants of Walbach; nevertheless some very odd things could be told of teachers in the rural parts of England. Some who are employed to instruct the village children cannot write, and in some instances they can barely read. Of general knowledge they are so lamentably deficient, that many of the books used in their schools require to be constructed in the form of question and answer like a catechism. The deficient supply of good teachers is in truth a great and universal complaint. Efforts have for some time been making to increase the supply, by establishing normal institutions, yet we feel confident that all such endeavours will prove unavailing unless teachers be better paid for their labours. It is quite common in England to offer L.60 per annum as a sufficient remuneration to teachers; and the consequence is, that no man with a good education and respectable character comes forward for the office. Any man possessing a character for integrity, who can write a good hand and keep accounts, will find no difficulty in realising L.100 per annum as a clerk. How, then, should we expect an individual so circumstanced to become a schoolmaster for L.60? The idea is preposterous.

Some of our readers have perhaps heard the following anecdote:—A lady in the country, the mother of a family, wrote to another lady, a friend in London, to ask her to be so kind as seek out a tutor for her boys. He was to be young and good-looking, to have an excellent moral and religious character, to possess a mild temper and obliging disposition, to be accomplished in many respects, and to be so learned as to take the entire charge of her sons' education preparatory to their leaving home for college—salary L.20 per annum. The town lady speedily answered her friend's letter by simply observing, that if she should be so fortunate as discover such a prodigy of excellence, she would be glad *to make him her husband!*

We do not know whether this be a true story or only a good joke, but it answers as a clever illustration of the unreasonable expectations formed respecting teachers, and the miserable salaries which are offered for their services. Nothing is more remarkable in high life than the large wages paid to cooks, and the small fees offered for governesses and tutors. "I understand Lady So-and-so keeps a French cook at a salary of a hundred guineas a-year." This is a piece of gossip which sounds well, and argues a large fortune and fine taste. Chatter about education and teachers is out of the question; and any young lady of fashionable appearance will answer to pass off before company as "my governess," provided she can exhibit with a certain degree of skill on the piano-forte.

Surely all this is a wrong state of things, and deserves unmeasured reprehension. We have a great mind to commence holding up to ridicule the monstrous requisitions of advertisers for persons to whom the education of youth is to be intrusted. The advertisements in the Scotch newspapers for parochial schoolmasters are particularly amusing. One appears in a paper now before us: it is for a parish schoolmaster who must be able to teach "English reading and grammar, writing, arithmetic, book-keeping, mensuration, geography, Latin, and Greek;" and the salary is to be the *maximum*, with the addition of a house and garden—that is to say, he is to have the largest allowance which is made, or something below L.40 a-year, and reckoning house, garden, and fees, which are precarious, his entire revenue is to be worth about L.70 or L.75 per annum. Now, we ask if this be not unconscionable? A person is wanted who must have received a classical education, and in fact have been educated up to the point of eligibility for a living in the church; his moral and religious character is to endure the most awfully rigorous scrutiny; he will be expected to dress and live pretty much in the rank of a gentleman—and, for all this, he is promised the amazingly high sum of 30s. a-week, which is about equal to the wage of a well-employed artisan or police officer! Can any thing, we ask, be more ridiculous than this modest proposal!

The proper education of youth is, without exception, the most delicate and important matter for arrangement in civil society, and the class of individuals to whom it is committed, ought to stand in the very first rank of citizens. It is certain, however, that a highly cultivated body of men will either refrain from attaching themselves to the profession of the teacher, or hasten at all convenient opportunities to leave it, if their condition be not elevated, both as respects emolument and public estimation. In the present note, we have no desire to say more on this important topic, and only add that we shall take every feasible occasion of agitating the question, until we see a little more common sense prevailing on the subject.

ADVICES TO YOUNG MEN ON WALKING EXCURSIONS.

YOUNG men, who break away from regular, and perhaps sedentary employment, to take a walking excursion of a few days in the country, often commit such grievous errors as mar their enjoyments, and deprive themselves of all the benefit they had calculated upon as the proper result of an exemption from ordinary duty. With soft and relaxed frames, they, in many instances, address themselves to walk such a distance each day as only could be conveniently walked by a person accustomed to such tasks. Accordingly, by the end of the second day at farthest, their feet are all over blisters, their strength is completely exhausted, and their whole system is in a fever of nervous agitation, the consequence of enormous voluntarily incurred suffering. The next morning, perhaps, sees them a little recovered, and, with their small stock of renewed strength, soaped stockings, and a vigorous resolution, they set out upon the third day's travel, which probably concludes by leaving them in a worse state than before. There is no time, however, to wait for a perfect recovery; so they travel on, and probably complete their excursion in a miserable dragging fashion, glad to get over the country without enjoying it, so that they only have the prospect of being again speedily at home and at rest.

This is the unavoidable consequence of ignorance and want of reflection. The excursion might have been a source of pleasure instead of pain, and might have added considerably to the youth's stock of ideas, instead of leaving him disgusted with the country and with nature, if he had only proceeded upon right principles. He ought to know that the body, after being long under the influence of a sedentary profession, or of ordinary city life, is not in a state fit for undertaking great fatigue. When soldiers, after being a considerable time in garrison, are about to undertake a long march, they usually are led out to take short walks each day for about a week beforehand, every day's walk lengthening a little, until they become fitted for the serious task. This they call being *beat into a march*. It is a practice founded on right physiological principles, and worthy of being followed by every individual in like circumstances. In the walks of the first two or three days, young pedestrians should not set themselves to any certain number of miles, but only walk as far as they feel their strength will agreeably carry them. Thus they will gradually acquire power, instead of losing it, and in the long run become good walkers, enjoying the country, moreover, as they go along, and leaving off with an increased love of nature, and a disposition to have another such walk at the first opportunity.

Young travellers, and old ones too, often make a great mistake with regard to eating. They suppose that, having much fatigue to undergo, they ought to eat a great deal; and the excitement of novelty, and the tempting and unusual food presented at inns, enable them to carry out this idea into practice. In a few days, however, they find themselves unaccountably unwell. This is the consequence of simple overeating, for, in travelling, there is no need for more food than usual. Food is also taken at wrong times, and of wrong kinds. It is not uncommon for young pedestrians to walk ten or twelve miles before breakfast, not so much for any economy of time or money, as under the impression that they will have a capital appetite at the end of their walk. As they go along, they delight themselves with reflections as to how they will astonish the waiters, how fresh relays of eggs will be called for, and rolls vanish like morning dreams. Alas! when they have walked their dozen miles, their frames are in a state the most unsuited for the receipt of a full meal; and, if they are *able* to eat largely, it will be the worse for them after. The whole aim here is the very reverse of what it ought to be. A very full meal should never be taken on a pedestrian excursion, and that simply for the reason that there is no time to digest a very full meal. A breakfast or dinner during a walking excursion, when only a little time can be allowed for rest afterwards, should be light. Whether light or heavy, the longer the rest afterwards, the better—that is, of course, within a reasonable limit. Certainly the rest should not be less than three-quarters of an hour; and, if a heavy meal have been taken, half an hour longer will be required at the very least.

Many young travellers have the prudence to fare slightly during their day's walk, but, on getting to their inn in the evening, they make all up, as they think, by taking a great composite meal—dinner, tea, and supper, rolled into one. If, as often happens, this be taken pretty late, the tea keeps them awake half the night, by virtue of its exciting power. But it may act injuriously in another way. When much of it is taken in proportion to the solids, it prevents digestion. The gastric juice, it must be understood, requires that what is submitted to it should possess a certain solidity. It is for this reason that nature has so arranged, in the case of sucking infants, that the milk curdles immediately after being taken, the gastric juice being thereby enabled to catch hold of it. When a young man, after exhausting his energies by a long walk, fills his stomach with a great *blashy* meal, he commits one of the greatest of imprudences. The gastric juice gets mixed and confounded with the mass, and several hours will elapse before any progress whatever be made in digestion. Many is the sleepless night endured on this account on summer excursions. It is obviously necessary that, if tea is to be taken at all at a late hour, it should be weak, and in quantity strictly proportioned to the solids taken at the same time. Coffee, however, ought always to be preferred to tea, if to be taken near bed-time, as its exciting power is much less.

The rules here laid down are all of them grounded on natural principles, which will be found more particularly explained in physiological works—those, for instance, of Dr Combe, which are by far the most intelligibly written, at the same time that they are even more philosophical than most others. By attending to such rules, a rural excursion may be made very delightful, and may have the best effects on both body and mind; while neglect of them as certainly must entail pain and disappointment.

THE FERRY OF BOLDSIDE.

A SCOTTISH STORY.

THE Ferry of Boldside is situated within half a mile of Abbotsford, erected near the Tweed by the great ornament of the literature of Scotland. Though still presenting the convenience of a boat and boatman to passing wayfarers, it is comparatively but little frequented now-a-days, bridges being built near the spot, which afford a safer and more agreeable means of transit. Formerly, however, the ferry-boat constituted the only means of conveyance, to church or market, for all foot-passengers from the Selkirk to the Galashiels' side of the water, and *vice versa*. The fairs held at these towns always, of course, brought a temporary increase of custom to the ferry, in these circumstances. On one memorable occasion, a fair was held at Selkirk, and many were the passengers on that day at the ferry. In the morning, all went on well, but ere the visiters to the fair returned in the evening, the condition of the river was greatly changed. The rains had fallen heavily during the day, and the Tweed had risen rapidly, carrying down the brown soil from a thousand hills. Still the ferryman, by the help of a bold heart and a strong and skilful hand, continued to labour successfully in his vocation, and brought through the stragglers from the fair safely, by ones, twos, and threes.

At length, a party of fifteen persons arrived on the bank opposite the ferry-house. This company was somewhat remarkably circumstanced, being not only a fair-party, but also a wedding-party. A bride and bridegroom were there, surrounded by their friends, and with their *best-maid* and *best-man*, as the Scottish people denominate the bridesmaid and bridegroom's-man. Happy and light-hearted, from the double festivity of the occasion, this party halloed for the boat. The ferryman did not refuse to come at their call, though he could not avoid casting uneasy glances at the still swelling waters. He got safely across, and proposed to take the company to the other side by turns. Unfortunately, they would not agree to be so received. In the elation of the moment, they saw not, or despised the danger; and, notwithstanding all the ferryman's remonstrances, the whole fifteen leapt at once into the boat. Ere another word could be said, they had it also pushed off from the shore.

"Sit steady," cried the boatman, earnestly and loudly, as he gave the first stroke with the oars; "be steady, for your lives!" He spoke, unluckily, to those who were not in a mood to attend to his caution, even if they had comprehended, as he did, the full perils of their position. They were all young people, fresh from a scene of enjoyment, and happy in the consciousness of what had brought them together. Some of the men were no sooner in the boat, than they resumed such rustic badinage as had been passing among them ashore. The light boat, already depressed to the water's edge, rocked perilously from their unguarded movements. "Sit still, all of you!" exclaimed the boatman again, in tones of earnest entreaty; "be quiet, or the boat will certainly split or sink!" His words were still unheeded, and the consequences were as he foresaw. Some who tell the story aver that the boat struck a rock; but this is less likely than that the timbers split open, simply with the weight above, and the oscillations alluded to, which would obviously have a powerful effect in such circumstances. However this may be, the fragile bark was at all events broken to pieces, and the whole party thrown into the deep and turbid stream.

Digitized by Google

This accident happened in the evening; but there was still sufficient light to enable the whole transaction to be seen perfectly by persons at a considerable distance, whose attention was arrested in the first instance by the agonising shrieks of the females, and the lower-toned but not less appalling cries of the men, thus cast upon the mercy of the waters. To afford help to them, however, was a thing barely possible. The river bore one and all of them down with such rapidity, as to set at nought the exertions of those among them who could swim; and this would probably have been the case even if their condition had been more favourable for that mode of escape. One man only of the number was able to reach the bank. He had nearly grasped a bush, and safety lay seemingly within his reach, when suddenly he felt himself seized and pulled back by one of his companions, a young woman, the bridesmaid of the party. "For the love of Heaven!" he exclaimed, "let go your hold, or we must both perish!" "No!" answered the poor girl, clinging to him with a degree of force conceivable only in such a moment of mortal agony—"no! come death, come life, I shall hold by you!" The man, nevertheless, got his foot to the ground, made a powerful exertion, and reached the land, carrying with him the girl who had fixed herself upon him.

For a few minutes, the pair thus rescued were unable to utter a word, and could only express their gratitude to Heaven in the silent language of the eyes and heart. As soon as the young woman regained the power of ordinary speech, however, she addressed her companion in these words:—"I am the betrothed bride of another man; but I have said the word at this awful moment, from which I shall never draw back. In death or life I am yours! If you will take my hand, we shall part no more in this world." The young woman who thus spoke was noted for her comeliness, as well as for the excellence of her character and her amiableness of disposition. The young man who had saved her was well aware of this, and heard her affecting offer with as much pleasure as any thing could excite at such a time. In these extraordinary circumstances was a match made between the pair. They joined hands, and from that moment held themselves united for life.

Meanwhile, the waters of the Tweed had swept down, and brought destruction to every other member of this ill-fated party, excepting only one man. This individual had caught and attached himself to a portion of the broken boat, of sufficient size to bear him up above the surface; and along with this splinter he was carried rapidly down the river, while his companions were perishing. It is said that he himself was hopeless of ultimate preservation; but, after being borne down in an inconceivably short space of time, for a distance of two miles and upwards, succour came to him in an unexpected form. A boatman, who kept a ferry at the point alluded to, chanced to be looking out at that moment on the foaming river. He saw approaching him the person attached to the piece of wood, and even heard the unfortunate man's voice—not calling for human help—but calmly chanting a psalm, in praise of Him from whom alone, in that extremity, the worshipper had any hopes of aid. The psalm, it may be interesting to the reader to know, was the 103d, a peculiar favourite in past days with the rural population of Scotland, and one which almost every child could say *by heart*, to use their own phrase on such occasions. The sentiments contained in it are such as to justify this preference.

> The Lord our God is merciful,
> And he is gracious,
> Long-suffering, and slow to wrath,
> In mercy plenteous.
>
> Such pity as a father hath
> Unto his children dear,
> Like pity shows the Lord to such
> As worship him in fear.
>
> For he remembers we are dust,
> And he our frame well knows.
> Frail man! his days are like the grass,
> As flower in field he grows:
>
> For over it the wind doth pass,
> And it away is gone;
> And of the place where once it was
> It shall no more be known.

Such was the appropriate hymn which the individual referred to was engaged in chanting, when borne along the waters, to a premature grave, as he himself believed. The ferryman who saw him, however, was a man of stout heart, and formed an instant resolution to attempt his rescue. Running hastily to his boat, he loosened the fastenings, and was in a few moments in the middle of the current. He could not prevent himself from being carried rapidly downwards, but he was successful in taking up the floating man. They were both landed in safety, at a point a considerable way down the river.

The man thus rescued lived to a very advanced age, and never, during the remainder of his life, did he forget for one day the fearful peril from which he had been saved. He got the splinter of wood into the ferryman's boat, and carried it afterwards to his own home. There, at a future period, he made it be introduced into the structure of the coffin destined to receive his remains, and kept this article beside him till the hour of his death. Then, in accordance with his wishes, he was laid in earth with the wood wrapped around him, which he had ever looked upon as the immediate instrument of his preservation.

This melancholy accident, by which twelve persons were consigned to a premature grave, made a great sensation, it may well be believed, in the district where it occurred; and to this hour it is remembered by all who dwell near the Ferry of Beldside.

VIEW OF SOME RECENT LECTURES IN DUBLIN.

On Wednesday, the 8th April last, a series of lectures given in Dublin by members of the Royal Zoological Society, terminated with one on the Chameleon, delivered by Sir Philip Crampton in the theatre of the Dublin Society, which was crowded on the occasion by a most respectable auditory, the Lord-Lieutenant being amongst the more distinguished persons present. The summary of the winter's lectures, which was afterwards given by Mr Balls, contained so many interesting particulars, that we believe it may be worth while to present an abridgement of it. We quote from the report given in a supplement to Saunders's News Letter of the 13th April.

"I commence with his Grace the Archbishop of Dublin, President of the Society, who, in a short address, remarked on the great progress natural history had made in public estimation within a few years, and contrasted it with the not very remote time when a naturalist was considered an object of wonder or contempt. He lauded natural history as a means of developing the intellectual and moral faculties, and very happily illustrated his views by reference to that most excellent story of 'eyes and no eyes.' His grace stated that, were we merely to consider the study of nature as a recreation, it deserved our best support as an amusement free from evil, but that it had higher claims as a volume of God's works, the right understanding of which is within the reach of the great mass of the population, who, could they be brought to read it, would derive the highest good both to their temporal and eternal interests, from the development and exercise of their faculties. His grace wisely adverted to the common but very injurious custom of decrying scientific pursuits which have no very definite ultimate object of utility, and he well instanced astronomy, from which results so unexpectedly advantageous to man have arisen; perhaps I may add another apposite example—that afforded by the illustrious Jenner, who, with the eye of a naturalist, the skill of a physician, and the reasoning of a philosopher, saw (what thousands before must have seen), a loathsome disease in a cow. But he looked at it, and reasoned—the result has been, that to three-fourths of you he has preserved that smoothness of skin which forms so important an item in personal beauty, to many of you your lives, and to not a few your sight. Who could have imagined that the patient examination of a foul disease in a brute beast, could have originated the greatest and most general good that man has given to his race." After some further remarks on the archbishop's address, and adverting to the lectures of Dr T. E. Beatty on the preservation of species, and those of Dr Corrigan on the circulation of the blood, Mr Balls proceeded—"Dr Coulter gave you an account of the habits of grisly bears in California, and told very surprising stories of their great strength and ferocity, which fell under his own observation while resident in their neighbourhood. He narrated many hair-breadth escapes and deeds of daring in the pursuit of those monsters of the forest, in which he showed how much more man owes in his encounters with wild beasts to coolness and self-possession than he does to animal strength. Thus, I once saw a butcher's boy dare the utmost ire of an infuriated bull, which had just before routed a civil and military force brought out against him; indeed, so great was the panic he caused, that not a few of the routed sought for refuge in the upper story of a small house, when some one calling out that the bull was coming up stairs, more than one of the party jumped out of the window to avoid him. However, he had gone in another direction, where he was met by the boy twelve years old, who stood directly in his way, struck him with his hand on the nose, and jumped aside. The bull charged the boy several times, who repeated his operations, until the routed foe gathered courage, and again came to the attack, when the bull was brought down by several shots. Dr Coulter mentioned that Indians distinguished the bears most celebrated for rapine by name, knowing them from their foot-marks. Strange though this may appear to us, who do not direct our attention to such subjects, yet we have many instances of similar powers of observation. I may notice one of recent occurrence, in a late very unfortunate Australian expedition. The party sent out experienced great privations, and consequent delay in returning to the colony. On their journey towards home, they came upon the foot-marks of a number of men; the native who was with them stated whose they were; and on the arrival of the travellers at the colony, it was found he was quite correct, and had named every individual of a party sent out to succour those who were missing. Dr Coulter's paper being, as it were, a part of his personal narrative in his enterprising travels, could not fail to interest those who value original observation."

Dr Houston's lectures on the internal structure of the ear were next spoken of; and Mr Balls then alluded to those of Dr Kennedy on "the physical agencies which influence the organisation and developement of animals and man. He wisely and philosophically urged attention to physical education on all who value soundness of body and mind, and showed examples of the advantages resulting from such attention, and the injurious effects from its neglect. He instanced several cases of self-produced deformity or mutilation, and in a playful but justly satirical manner assumed that the females of no nation could be so irrational as, with engines composed of steel, whalebone, and strong cord, to reduce by force the space essential for the proper movements of vital organs; as well may we hope to improve the correct going of a chronometer by bulging its cases. The ideal beauty sought to be obtained, does not result from the operation—the operators, not knowing where to stop, give another and another tug, until that wasp-waistedness is acquired, which is as unlike real beauty as the churn-shapedness which results from it in old age is unlike grace. One example, however, is better than much precept; and as I cannot with propriety instance any lady, I will take a gentleman, who, when about seventeen years of age, had attained a mush more than ordinary height, and with it the disadvantages of what is called over growth, particularly a sensation of weariness from sitting or standing for any continuance. At that time, the numerous but now extinct race of monkey-men called Dandies were at their zenith, and stays were much in use. He procured one, with all its accompaniments of straps, buckles, and bones; and, braced therein, found at the moment comfort and relief; but he soon discovered that it was becoming every day more needful. A book on physical education then fell in his way, and opened his eyes to the real state of the case. He saw that, when muscles are weak, if supported, or their work done for them, they become weaker, until they fade away into uselessness; while, on the contrary, if worked gently and progressively, they gradually gain strength, and acquire permanent health and force. Acting on this view, he cast away his stay, and undertook a course of exercises, the object of which was to develope the muscles he before sought to support. The result was, that he rapidly acquired well-developed natural stays, which rendered him totally independent of artificial support. Dr Scouler, in a recent lecture read at the College of Physicians, described a distortion of head, produced artificially, by some of the American Indians; and showed specimens in which the foreheads were pressed backwards, and the sides of the head outwards, so as to produce the most astonishing deformity; yet, from the doctor's account, this practice is not so inconsistent with reason as that before alluded to; for it does not appear that the head-pressed, who are the chiefs of the nation, are in aught sufferers, either in health or mind, from the operation. Who can say this for the lung-pressed? A treatise on the self-produced alterations of the animal, man, would afford much scope for philosophical observation. We stare at the Indian who slits and stretches the cartilage of his ears, until they serve him as straps in which to pack his fishing-hooks, knives, and other small valuables—we think not of contrasting the utility of this practise with that of certain folk who make tiny orifices in their ears, from which they hang pendant miniatures of brass candlesticks, or other equally graceful forms. Surgeon Wilde, in his interesting book, lately published, speaks of the exceedingly graceful mein of some Arab girls he met, carrying water pots on their heads. He takes the opportunity of decrying backboards, collars, and such like implements of ignorant torture, which go far to effect the very object they are invented to counteract. If the pupils in ladies' boarding-schools were encouraged to dance and run about with books, for instance, à la milk-pail, paying forfeits for dropping them, they would take pleasure in the exercise as a feat of agility, while their carriages would be quickly improved, and the governesses saved the perpetual and teazing cry of 'Hold up your head, my dear.' If colleges would institute a new degree for professional men, who may be called doctors of physical education; were intelligent minds thus directed to the subject, and the public induced to place confidence, how comparatively little would doctors of medicine have to do. We should then seek advice to preserve health when well, rather than to repair it when shattered. Dr Kennedy showed to you in M. Huguenin, an example of the effect of well-directed exercise. This excellent professor of gymnastics, while he is a model of graceful strength, shows evidence of having been once of rather slight form.

Charles Hamilton, Esq., commenced on our third night of meeting, with a paper on deer (cervidæ), and after a few general views on life and organised matter, dwelt for some time on the singular phenomena presented by most species in their annual change and growth of horns—as they are improperly called, for they are not analogous to horn, but are in reality processes of bone from the skull—which, in the stag for instance, bud out, as it were, in a soft and sensitive form, in single spikes the first year, and gradually assume a bony hardness. After remaining on the animal's head some months, they drop off, and are succeeded by larger forked horns, and so on at regular intervals, until the full head of antlers is acquired. The variation of the size of arteries, the progress of the antler through its vascular and highly sensitive form into a bony and insensible substance, to be cast away when it appears most useful, with the changes of temper, habits, &c., of deer, during the course of this change, are subjects of great interest, and not the less so because they are common. Mr Hamilton gave you many interesting particulars about several species, amongst others the rein-deer, a most important animal, when we consider that without it the people inhabiting the Arctic regions would be destitute. No animal exists in any other part of the world that ministers to so many of the wants of man as the rein-deer. An hour would be well spent in speaking of this one alone. The family are all more or less interesting, and it is to be regretted that much difficulty exists in propagating exotic species in these countries. What this difficulty is, I do not think very clear, but that it exists has been proved by repeated experiments. Possibly impatience under restraint has been the cause; and perhaps if we could defend from man—the common enemy of the race, before whom our own stag is fast disappearing—a few rein-deer, wapati, roe-bucks, &c., and turn them out to stray on our mountains, they would live and do well where now not even a goat finds sustenance. The accomplishment of such naturalisation is one of the particular objects of our society, and it is one of much higher rank than the yielding to love of novelty—a mischievous passion, which grows by indulgence, and is never satisfied. It would be a source of much comfort, did those only complain of want of rarities who well understood a single animal in the creation. I may conclude my very imperfect notice of Mr Hamilton's interesting paper, by recounting an anecdote of a wapati in our own gardens. This deer became affected by a disease of the wind-pipe, and a consultation of physicians being had, it was decided that the operation of laryngotomy should be performed

Digitized by Google

by the surgeon-general. Accordingly, a number of men with boards, ropes, &c., contrived, at considerable personal risk, to secure the patient in a corner. With much difficulty the operation was commenced; but the moment the wind-pipe was opened, she felt relief, and at once submitted to the tender hand of the operator. When it was necessary several times afterwards to introduce a probang, she bore the operation not only without resistance, but with evident desire to facilitate it, though the pain must have been very great, as was shown by her agonised shuddering, while the expression of submissive suffering and confidence in the face, would have been sufficient to call up a blush in those who would shrink from momentary pain, which may save them from lingering suffering, or even death.

Surgeon Hargrave gave you a very interesting insight into an extensive subject, the prehensile organs of animals, in which he showed the astonishing fertility of invention in nature. The claw of a crab, the tail of a monkey, the talons of an eagle, the trunk of an elephant, the sucker of a cuttlefish, the jaws of a dragon fly, and a thousand other less familiar subjects, in form most various, but in end the same, may be brought before you, minute inquiry into any one of which would unfold much physiological knowledge. Amongst these, the elephant's proboscis strikes us with the greatest astonishment, from its varied purposes; at one time only a nose, at another a drinking vessel, a water-engine, and a bellows; and then a hand, guided by many thousands of muscles, possessing unequalled mobility and enormous strength, it can pluck a blade of grass, or tear from its roots a palm—can catch a fly, or fell a tiger. Yet the human hand excels this and all other instruments of prehension; for though in its naked state its owner cannot effect many things that are easily accomplished by other animals, yet guided by mind, he can fashion with it instruments whereby he can not only excel individual animals, but attain ends which could not be come at by the combined might of all other instruments of prehension in nature.

Professor Harrison gave you a popular view of molluscous animals. Some few years ago, conchologists and collecters of shells were held in little esteem, and the malacologists, or persons interested in their animal inhabitants, were here unknown. The case is now different; conchology is justly valued for the aid it affords to the important science of geology, for fossil shells are not in these days considered freaks of the plastic power of nature, but (as they have been elegantly termed) the medals of creation, from which we may obtain data to judge of the relative ages of the earth's strata. The necessary knowledge of them can be best obtained by studying recent shells, and the study and the collection of these objects are now admitted to be worthy recreations, vieing with floriculture in interest, and contending with it in utility—the one serving in the hands of the geologist most important purposes, while the other renders up its service to the horticulturist and botanist. In reference to shells, it has been well remarked, that if the mansion in which an animal dwells is worthy of examination, the architect and inhabitant must be so. The works of Poli and others show the interesting results which flow from such examination to the physiologist and comparative anatomist, for it is by tracing the progression of faculties from the lower to the higher animals that we are to look for the revelation of many of the mysteries of nature. The eloquent professor gave you very interesting accounts of the nautilus and argonaut creatures, which, from the earliest periods, have attracted the attention of poets and men of science, both equally inaccurate in description. It is strange how many instances have occurred in natural history, in which absolute fables have been handed down uncontradicted for ages: thus, in this case, the story of the argonaut spreading her sails to catch the wind as she floats on the surface of the water, has been believed by all, and doubtless seen in the mind's eye at least by many; while the most celebrated naturalists of the present day have waged the fiercest scientific war on the question of the right of the animal found in the shell of the paper nautilus to be considered as the fabricator of it. An immense quantity has been written on this subject, and it is but a few months since that the matter has been set at rest by the only court of appeal that can decide on disputed points of natural history—I mean, observation. Madame Power and M. Sandar Rang instituted such scouts, and by patient investigation have proved that the once-called sails are arms, by which the shell is not only held in its place but fabricated; thus proving most satisfactorily, by observation, what closet naturalists, theorising from analogy, had so long doubted. This story will put you in mind of the very useful moral conveyed in the joke put upon the Royal Society by the king, who asked that learned body why a tub containing water did not become heavier by adding to it a living fish. Very many sapient reasons were offered in explanation, until one sceptical gentleman experimented to prove its truth. If his majesty's intent were to show the value of observation, compared with the vain reasoning and theorising of the day, it was a lesson of much utility. Professor Harrison concluded with observations on the injuries done to wood-work exposed to sea by the teredo, and he proved to you the enormous expense this little creature entails on man, in protecting by copper, and other means, his ships from its destructive ravages. Though this animal has obtained from the great Linnæus the title of *calamitas navium*, yet observation shows, paradoxical as it may seem, that, did it cease to exist, the earth would be a bog, the sea scarcely navigable; for the mouths of rivers would soon be blocked up by trees, washed down by floods, while the ocean would be dangerously covered with floating logs of timber; but now these trees and logs are eaten up in a very few months by the teredo, which is thus shown to be the best friend of the navigator, though unthinkingly called by him his worst foe. Who—who that has reason—would dare, if he could, blot out the race of any animal from the face of creation? Man has many times suffered from his attempts at extermination, and in no way, perhaps, would he suffer more, than by utterly destroying the mischievous teredo, and its active little ally, the xylophagous limneria.

Professor Kane showed you a number of interesting products of the animals which minister to our wants or luxuries. The subject is one of very great extent; a mere catalogue would quite astonish those who have never thought on the subject. As a familiar example, take a lady and gentleman in full dress; it is not unlikely that the following animals have suffered death to furnish their outfit:—elephant, oyster, bullock, bleake, stag, silkworm, horse, cochineal, lac insect, musk-deer, bee, ermine, calf, civet, pig, tortoise, kid, ostrich, kangaroo, bird of paradise, swan, beaver, sable, sheep, whale, goat, walrus, rabbit, mussel, bear, and probably a great many others that I cannot recollect. If the lady get cold, blistering beetles or leeches may afford her important aid, and in the days now past, ere chemistry was all-important in *materia medica*, she would be dosed with numerous nauseous drugs, drawn from the animal kingdom. The medical books of former times are half filled with modes of preparing animals for use in medicine; even man himself was dried, powdered, boiled, distilled, and otherwise manipulated, to furnish remedies." Mr Balls stated that the ladies had taken much interest in Dr Kane's lectures, and had indeed contributed much to the success of the whole series. He then hastily reviewed a lecture by R. Mallet, Esq., on the principles of contrivance in machines and animals; after which he noticed that of the Rev. Cæsar Otway on the habits and intellectuality of animals, from which we lately gave a few extracts in the present work.

SOUTHGATE'S TRAVELS IN THE EAST.*

A "Narrative of Travels in Armenia, Kurdistan, Persia, and Mesopotamia, by the Reverend Horatio Southgate," forms an interesting addition to the number of those works by which the Christian missionaries of the United States of North America have of late years gained for themselves so much honourable distinction. By reprinting the productions of the Reverend Howard Malcom, we ourselves gave a practical expression of our approval of this peculiar class of works, which combine information upon points of the highest interest to man, with such a measure of lively and entertaining description as serves to arrest the attention even of those more exclusively partial to what is called light reading. Mr Southgate is a fit and worthy colleague of the writer just mentioned, and we know not that greater or more appropriate commendation could be bestowed on him.

In an introduction of considerable length, Mr Southgate gives a very able and candid view of the doctrines of Mahommedanism, with observations upon its present condition and prospects in various countries of the East. The tour of the reverend missionary commenced with a visit to Constantinople, from which city he passed up the Black Sea to the port of Trebizond, and then crossed, through the provinces of Armenia and Kurdistan, into Persia. His remarks upon this route, relating to the wandering Kurds and Armenians, and descriptive of the large cities of Erzroum, Betlis, Tebriz, and others, fill the first volume with very interesting matter. We prefer, however, to take up the traveller after his entry into central Persia. He formed a very low opinion of the people of that country, as regarded many important points of social morality. The Persian dervishes are described by him as intolerable pests. "These religious mendicants resemble more the santons and fakirs of India than the dervishes of Turkey. They are not, like the latter, gathered into communities, but roam over the country, living upon charity, and practising villanies of every sort. They carry with them a horn, which they blow on approaching a town, and a little wooden vessel in which they receive their alms. They are not respected by the people, and are exceedingly insolent. They are clamorous in demanding charity, and sometimes sit down before a house with the determination not to quit it until money is given. There they remain, day after day, and week after week, execrating the inmates, until their demand is granted, or they are beaten away. One sat in this manner more than three months before the British residency in Bagdat.

A story was told me at Tehran of another, who placed himself in a niche of the wall in front of the ambassador's palace. His incessant importunities becoming troublesome, and it not being thought safe to oust him by force, a curious expedient was devised. The ambassador gave orders that the niche should be bricked up. The dervish was warned of the intention, but persisted in maintaining his position until the wall had advanced as high as his chin, when he thought it prudent to ask a release. In another instance, at Shiraz, a dervish had taken his station at the foot of the flag-staff, where his clamour soon became annoying. The agent quietly gave orders that the staff should be washed every morning, and a man was sent up for the purpose, who poured down pailfuls of water, until the intruder beneath was glad to decamp."

Lying is still more characteristic of the Persian than begging. "There does not, I am ready to believe, exist a country where society approaches more nearly to that (which moralists have sometimes imagined) of a community where truth is unknown, than Persia; and the only reason why there does not exist a corresponding want of confidence, is, in good part, that inherent vanity of the Persians which makes them willing to be deceived. I learned for myself, long before leaving the country, that my only security was in acting upon the supposition that every man was unworthy of trust. 'I have never,' said a pious and intelligent gentleman who had resided twelve successive years in the country, who had travelled over almost every part of it, and been conversant with all classes—'I have never,' he said to me one day, 'seen a Persian whom I found, on good acquaintance, that I could safely trust.'

It is wonderful, indeed, with what facility most Persians utter a falsehood. It has often seemed to me like an instinct with them. They are fully conscious of the vice, and acknowledge that it prevails every where among them. They perpetrate it with the utmost indifference, and, on being betrayed, seem to have no shame, nor any sense of having done wrong. They practise it with the most astonishing hardihood. I have heard a Persian lie, and persist in it even against the immediate evidence of my senses." The source of this habit, so disgracefully universal, is to be sought for, our author thinks, in the native character of the Persians, in their imaginativeness of mind, and love of the marvellous. Their extreme affability of speech aids in producing the same effect; they often lie for the mere sake of pleasing. "But that which lies beneath all these, and which is the root of all, is their want of conscientiousness, and singular weakness of moral principle."

We have long been accustomed to associate with Persia very erroneous notions of splendour and magnificence. Tehran, the capital of the country, containing about 60,000 inhabitants, is characterised by "streets peculiarly bad, for the most part destitute of pavements, narrow, irregular, and full of dangerous holes. The houses are extraordinarily mean, and unsightly ruins, covering in some instances extensive areas, frequently meet the eye." The interior of these dwellings, except in the instances of a few abodes of the great, corresponds with the exterior. So much for the aspect and condition of the first city of the Persian empire. The following quotation will exhibit the common state of the rural dwellings of the land. "On opening a door, we came suddenly into the family apartment, where were two or three women and six children in the full enjoyment of domestic comfort. In order to understand what domestic comfort means in Persia, a little explanation is necessary. The most common fire-place in a Persian apartment is a circular hole in the ground, two or three feet deep, called a *tandour*. A fire is lighted at the bottom, and when this has burned out, a fine glow of heat remains. A low wooden frame, somewhat resembling a table with its legs reduced to the length of a foot, is placed over the tandour, and upon this is spread a large coverlet, which extends several feet beyond the table on every side. The family then lie down in a circle, their bodies forming the radii from the tandour, which is the centre. Thus disposed, they draw the coverlet up to their chins, and the beholder sees nothing but a circle of heads emerging from beneath it. Our sudden entrance produced some confusion among the inmates, and the master appearing at that moment, ordered the family to retire to another apartment, and invited us to take their places under the coverlet. We had had so many lessons, however, upon the imprudence of occupying family quarters in a Persian village, that we were content to spread our carpets in the farthest corners of the room, and repose upon them." In truth—as, but for early prepossessions, we should at once perceive—no country can be the scene of any thing like general magnificence, where the people are plunged in ignorance, and do not enjoy the constant advantages of active commerce and rational liberty.

Though the Persians show a total disregard for the precepts of the Koran in many important practical points, as in the case of wine-drinking for example, which is universal, they are so far staunch Mussulmauns as to show a bigoted contempt for all forms of religious faith but their own. On visiting a very interesting spot, near Hamadan, a town on the south-west of Tehran, Mr Southgate saw this fanaticism cruelly exemplified, to the cost of himself and a few poor Jews. The spot alluded to was the tomb of Mordecai and Esther, whose story forms so pleasing an episode in the troubled annals of the race of Abraham. "Externally, the tomb is a very plain structure of brick, consisting of a small cylindrical tower and a dome (the whole perhaps twenty feet high), with small projections or wings on three sides. On the summit of the dome a stork had built her nest. The outer door was a single stone. While we were waiting for the key, a throng of young Mussulmauns gathered round and began to abuse us. As soon as the door was opened, and we were about to enter, followed by several Jews, the crowd raised a shout and rushed upon us with sticks and stones. I turned to remonstrate, but the rabbi checked me, saying, 'It is not meant for you, but for us. It is nothing strange.' We hurried into the tomb, and shut the door. The first apartment was a small porch formed by one of the wings. The entrance from this into the interior was so low that we were compelled to get upon our knees. Here was the place of the dead. The apartment was perfectly plain, simply plastered, and paved with glazed tiles. The structures over the spots where the dead are said to repose, are wooden frames, with inscriptions in Hebrew and flowers carved upon them. I wished to read the inscriptions, but the gloom of the place rendering it impossible, the rabbi directed one of the Jews to bring a candle. On attempting to go out, he was driven back by the crowd, who had raised an incessant uproar, from the moment that we entered

The poor Jews were afraid to show themselves, and it was agreed that they should remain while we went out and endeavoured to disperse the mob. On issuing from the tomb, we found that their number had greatly increased. We spoke to them, and they answered with a volley of stones." Mr Southgate's servant was seriously hurt, and the Jews had to remain for a long time shut up. Our author conceives it to be probable that this tomb, which was erected in the year of the world 4474, really contains the dust of the fair Jewess, who won the affections of Ahasuerus, and of her persecuted kinsman, who "sat at the king's gate."

We have had much pleasure in following the reverend missionary on his overland route from Tehran to Bagdat, and from Bagdat up the Tigris to the Black Sea, whence he returned by a steamer to Constantinople. On the present occasion, however, we can only yield space for another brief quotation or two from this very excellent work. The following is an account of an illusion of the desert, known under the title of the *mirage*, and which, if our memory serves us rightly, deceived a modern general and army on one occasion in Egypt to such an extent as to cause the escape of an important body of the enemy. "Soon after we started, I was surprised by the sight of what appeared to be a river before us; and, as we advanced, was still more surprised at the slowness with which we approached it. The deception continued more than half an hour, before I discovered that it was the mirage of the desert. The delusion was perfect. It seemed like a very large stream, about three miles distant, and every slight inequality in the level of the desert appeared like an island rising above its surface. While we were still, according to the estimate of our muleteer, about twenty miles distant from the city, the tops of its minarets and date-trees peered above the horizon, like the first sight of the upper spars of a ship at sea. As we drew near, the walls gradually rose to view. The mirage receded as we advanced, until, at length, while we were still some miles distant, minarets, and trees, and walls appeared to be floating in the illusive stream. Mahommed, to whom such sights must have been familiar, draws from them one of the finest similes in the Koran. 'As to the unbelievers, their works are like the vapour in the plain, which the thirsty traveller thinketh to be water, until, when he cometh thereto, he findeth it to be nothing.'"

The bigotry of the followers of Mahommed has been alluded to, and it is remarkable, that, to gain a proselyte, they will forego almost any purpose, however cherished. "During the Saracenic conquests, Christian captives often saved themselves from slavery or death by apostacy; and instances of recent occurrence were sometimes related to me, during my travels, in which Christians, exposed to the fury of Mussulmaun revenge, rescued themselves, in the last extremity, by crying aloud, 'There is no God but God, and Mahommed is the prophet of God.' A European officer, in the service of the late Pasha of Bagdad, had rendered himself obnoxious to the soldiery by certain infirmities of character, which would have been patiently endured in a Mussulmaun superior, but could not be borne in a Frank. The ill will of the soldiers at length arose to so great a height that it could not be restrained. One day, while he was drilling a party of them in the parade-ground, some violent expressions which fell from him threw the incensed soldiers into such a frenzy, that they rushed upon him with one accord, crying out against his life. The officer, seeing no way of escape, and expecting instant death, exclaimed aloud, '*La ilahi ill' Allah*,' &c. Instantly every arm was dropped, and the soldiers suddenly fell back, as if disappointed of their victim.

The same day the officer was conducted to the house of the mufti, to be instructed in the elements of his new faith. But ere he had made much progress, a friendly message was received from the pasha, representing the circumstances of the officer's conversion, and how improbable it was that he would ever become a sincere Mussulmaun, and ending with the intimation that it would be as well to dismiss him. The mufti yielded to the wishes, if not to the arguments, of the pasha, and the proselyte was secretly hurried out of the city, and conveyed into Persia. It hardly need be added, that his attachment to his new religion ceased as soon as he found himself again in a place of safety."

The wine-drinking of the Mahommedans has also been referred to. Some of the most renowned supporters of the faith have openly indulged to excess in wine. The wine-magazine of Shah Abbas, one of the most able of the Persian sovereigns, "who reigned in the seventeenth century, was among the most costly edifices of Persia. It consisted of a spacious hall, of which the entire roof was one magnificent dome. From the floor to the height of eight feet from the ground, the walls were of jasper. Above this, on every side, and over the whole interior surface of the dome, were niches of a thousand shapes, filled with vases of every imaginable form and material, appearing to the eye like incrustations upon the walls. They were of crystal, cornelian, agate, onyx, jasper, amber, coral, porcelain, gold, silver, and enamel, and were filled with the choicest wines. The pictures of this monarch, which are preserved to the present day, generally represent him in the act of drinking." One of the most ridiculous consequences of the Mussulmaun laws on drinking, is the license allowed to those who prefer distilled liquors to wine. The former are not forbidden in the Koran, and the "consequence is, that the confirmed sot, who swallows the strongest potations, is held in better repute than his more moderate neighbour who satisfies himself with wine. Another consequence is, that among the Turks, who are more scrupulous in observing their law than the Persians, there are far more who indulge in the use of ardent spirits than of the juice of the grape, and the effect of the law is to patronise drunkenness in the highest degree, while it condemns it in its mildest and least exceptionable form. A Turk, therefore, as he becomes a more confirmed sot, becomes, in the same ratio, a better Mussulmaun; for when he has reached that stage in which wine is too weak for his palate, he has only to grow conscientious and reform upon brandy."

OH! THE FLOWERY MONTH OF JUNE.

[FROM GILFILLAN'S THIRD EDITION OF POEMS AND SONGS, LATELY PUBLISHED.]

Oh! the flowery month of June again I hail as summer's queen;
The hills and valleys sing in joy, and all the woods are green;
The streamlets flow in gladsome song, the birds are all in tune,
And nature smiles in summer pride, in the flowery month of June!

There's music in the laughing sky, and balm upon the air;
The earth is stamped with loveliness, and all around is fair;
There's glory on the mountain top, and gladness on the plain;
The flowers wake from their wintry bed, and blush in bloom again!

Oh! the flowery month of June! my heart is bounding wild and free,
As with a fond and longing look I gaze once more on thee!
With all thy thousand spangling gems—a bright and blessed boon—
That come to cheer and welcome in the flowery month of June!

The lark hath sought an upward home, far in the dewy air;
While lowly by the rose's cheek, the blackbird's singing there;
Or, in its leafy bowers unseen, the thrush bursts forth in song—
A low and pleasing melody the woody dells among!

Oh! the flowery month of June; ah! me, where are the fond ones fled?
No spring comes for the parted friends, nor summer to the dead!
I miss them at the calm of eve, or sunny hour of noon;
Nor morning songs awake the dead in the flowery month of June!

AN HOSPITAL SCENE IN PORTUGAL.

"I WISH to give you," said a British officer, in a letter to a friend during the Peninsular war, "some idea of a scene I witnessed at Mirando do Cervo, on the ninth day of our pursuit. Yet I fear that a sight so terrible cannot be shadowed out, except in the memory of him who beheld it. I entered the town about dusk. It had been a black, grim, and gloomy sort of a day; at one time fierce blasts of wind, and at another perfect stillness, with far-off thunder. Altogether, there was a wild adaptation of the weather and the day to the retreat of a great army. Huge masses of clouds lay motionless on the sky, and then they would break up suddenly as with a whirlwind, and roll off in the red and gloomy distance. I felt myself in a state of strange excitement. My imagination got the better of my other faculties, and I was like a man in a grand but terrific dream. Thus feeling, I passed the great cross in the principal street, and suddenly fell in with an old haggard-looking wretch—a woman, who seemed to have in her hollow eyes an unaccountable expression of cruelty—a glance like that of madness; but her deportment was quiet and rational, and she was evidently of the middle rank of society, though her dress was faded and squalid. She told me (without my asking her), in broken English, that I should find comfortable accommodations in an old convent that stood at some distance among a grove of cork trees; pointing to them at the same time with her long shrivelled hand and arm, and giving a sort of hysterical laugh, 'You will find,' said she, 'nobody there to disturb you.'

I followed her advice with a kind of superstitious acquiescence. There was no reason to anticipate any adventure or danger at the convent; yet the wild eyes, and the wilder voice of the poor creature, powerfully affected me; and I went on in a sort of reverie, till I had walked up a pretty long flight of steps, and was standing at the entrance to the cloisters of the convent. I then saw something that made me speedily forget the old woman, though what it was I did see, I could not, in the first moments of my amazement and horror, very distinctly comprehend.

Above a hundred dead bodies lay and sat before my eyes, all of them apparently in the very attitude or posture in which they had died. I looked at them for at least a minute before I knew that they were all corpses. Something in the mortal silence of the place told me that I alone was alive in this dreadful company. A desperate courage enabled me to look steadfastly at the scene before me. The bodies were mostly clothed in mats and rugs, and tattered greatcoats; some of them merely wrapped about with girdles of straw, and two or three perfectly naked. Every face had a different expression, but all painful, horrid, agonised, bloodless; many glazed eyes were wide open, and, perhaps, this was the most shocking thing in the whole spectacle—so many eyes that saw not, all seemingly fixed upon different objects; some cast up to heaven, some looking straight forwards, and some with the white orbs turned round, and deep sunk in the sockets.

It was a sort of hospital. These wretched beings were mostly all either desperately or mortally wounded; and after having been stripped by their comrades, they had been left there dead and to die. Such were they who, as the old woman said, would not 'trouble' me.

I had begun to view this ghastly sight with some composure, when I saw, at the remotest part of the hospital, a gigantic figure, sitting covered with blood, and almost naked, upon a rude bedstead, with his back leaning against the wall, and his eyes fixed directly on mine. I thought he was alive, and shuddered, but he was stone dead. In the last agonies he had bitten his under lip almost off, and his long black beard was drenched in clotted gore, that likewise lay in large blots on his shaggy bosom. I recognised the corpse. He had been a sergeant in a grenadier regiment, and was, during the retreat, distinguished for acts of savage valour. One day he killed with his own hand Henry Warburton, the right-hand man of my own company, perhaps the finest made and most powerful man in the British army. My soldiers had nicknamed him with a very coarse appellation, and I really felt as if he and I were acquaintances. There he sat, as if frozen to death. I went up to the body, and, raising up the giant's muscular arm, it fell down again with a hollow sound against the bloody side of the corpse.

My eyes unconsciously wandered along the walls. They were covered with grotesque figures, and caricatures of the English, absolutely drawn in blood. Horrid blasphemies, and the most shocking obscenities in the shape of songs, were in like manner written there; and you may guess what an effect they had upon me, when the wretches who had transcribed them lay dead corpses around me. I saw two books lying on the floor. I lifted them up; one seemed to be full of the most hideous obscenity; the other was the Bible! It is impossible to tell you the horror produced in me by this circumstance. The books fell from my hands; they fell upon the breast of one of the bodies—it was a woman's breast. A woman had lived and died in such a place as this! What had been in that heart, now still, perhaps only a few hours before, I knew not. It is possible, love strong as death—love, guilty, abandoned, depraved, and linked by vice unto misery, but still love, that perished but with the last throb, and yearned in the last convulsion towards some one of these grim dead bodies. I think some such idea as this came across me at the time; or has it now only arisen?

Near this corpse lay that of a mere boy, certainly not more than seventeen years of age. There was a little copper figure of the Virgin Mary round his neck, suspended by a chain of hair. It was of little value, else it had not been suffered to remain there. In his hand was a letter; I saw enough to know that it was from his mother—*Mon cher fils*, &c. It was a terrible place to think of mother—of home—of any social human ties. Have these ghastly things parents, brothers, sisters, lovers? Were they all once happy in peaceful homes? Did these convulsed, and bloody, and mangled bodies, once lie in undisturbed beds? Did those clutched hands once press in infancy a mother's breast? Now, all was loathsome, terrible, ghostlike. Human nature seemed here to be debased and brutified. Will such creatures, I thought, ever live again—robbers, incendiaries, murderers, suicides (for a dragoon lay with a pistol in his hand, and his skull shattered to pieces), *heroes*? The only two powers that reigned here were agony and death. Whatever might have been their characters when alive, all faces were now alike. I could not, in those fixed contortions, tell what was pain from what was anger—misery from wickedness.

It was now growing dark, and the night was setting in stormier than the day. A strong flash of lightning suddenly illuminated this hold of death, and for a moment showed me more distinctly the terrible array. A loud squall of wind came round about the dwelling, and the old window casement gave way, and fell with a shivering crash in upon the floor. Something rose up with an angry growl from among the dead bodies. It was a huge dark-coloured wolf-dog, with a spiked collar round his neck; and, seeing me, he leaped forwards with gaunt and bony limbs. I am confident that his jaws were bloody. I had instinctively moved backwards towards the door. The surly savage returned growling to his lair, and, in a state of stupefaction, I found myself in the open air. A bugle was playing, and the light infantry company of my own regiment was entering the village with loud shouts and huzzas."

Reader, this is a fearful picture of the miseries inseparable from war. We are told that there is something noble in that unhallowed art, which teaches man to imbue his hand in his brother's blood; that there is something generous in that fine chivalric spirit which thereby *kindles* in the hour of alarm, and rushes with delight among the thickest scenes of danger and of enterprise; that man is never more proudly arrayed than when, elevated by a contempt for death, he looks serene while the arrows of destruction are flying on every side; that, expunge war, and you expunge some of the brightest names in the catalogue of human virtues, and demolish that theatre on which have been displayed some of the sublimest energies of the human character. It is thus that war has been invested with a most pernicious splendour, and the common sense of mankind been abused.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 448. SATURDAY, AUGUST 29, 1840. PRICE THREE HALFPENCE.

A FEW WEEKS FROM HOME.

NEW FOREST—ISLE OF WIGHT.

My journey southwards, as I formerly mentioned, was extended, by means of the railway from London, to Southampton; from which place of rising importance I proceeded for a week's recreation, and for the purpose of making some local inquiries, to the Isle of Wight. Southampton stands on the flat shore of a bay stretching out from the direct channel of the Itchin, and from it steamers regularly ply several times a-day to Cowes and Ryde, the voyage usually occupying about two hours, and at a small charge for passage. Being more animated with the wish of seeing the country than of pushing quickly over the ground, we selected the longest way about, but certainly that which is most romantic and agreeable—through the New Forest to Lymington.

If the reader be inclined for the jaunt, let him then come along with us into the glades of one of England's most ancient woodlands. It was on a delightfully fresh summer morning, that our post-chaise rattled up the main street of Southampton in a northerly direction, and, wheeling to the left, carried us speedily within the verge of the forest. Old-fashioned yellow mud cottages with vines trained up the walls, bushy hedge-rows and copses, small enclosed fields and clumps of oak in the open lawns, were passed in endless variety; and here and there the noise of the carriage sent the little black Hampshire pigs, which browsed on the wayside, off at a scamper to the nearest hut; or, rousing a herd of deer, caused them to bound rapidly away into the recesses of the forest. The scene was in every respect English, and well worthy of loitering over for a few idle hours.

Slowly did our vehicle pursue its way over the yellow-pebbled road, that we might have an opportunity of remarking the various points of interest, until we arrived at Lyndhurst, the capital of the forest, and situated near its centre. Although dignified with the appellation of capital, Lyndhurst is only a village consisting of a few brick houses of a humble but neat order, with an inn of loftier pretensions, containing a jolly large parlour with a jolly large fireplace, and lined with a delightfully antique green-coloured paper, covered all over with hunting-scenes, in which hundreds of jolly squires and yeomen are blowing bugles, leaping fences, and galloping merrily after hounds and stags through the openings of an endless forest. Many a carouse, I make no doubt, on the occasion of the steward's forest courts, has this said parlour with the old green paper-hangings witnessed. Adjacent to this respectable hostel of the olden times, and half shrouded among foliage, stands an aged brick edifice of still loftier distinction, denominated the Queen's House, and forming the lodge of the lord warden. As may be supposed, the lord warden is much too great a man to stay in this out-of-the-way unfashionable mansion, and he accordingly gives it up to his deputy the steward, and the steward resigns it to be shown by a female domestic, to whom a shilling is at all times a most acceptable offering. On being admitted to the interior by this discreet attendant, we were conducted to an old damp apartment on the ground-floor, called the hall, and which, as we were told, had been the court-room of the forest jurisdiction from time immemorial. A few lumbering benches, a bar and judgment-seat at one end, corroborate the statement. Allowing a minute or two to observe these decayed emblems of a state of things fortunately passing away, we are next shown an object which is evidently esteemed the great palladium of the establishment. This is an old rusty stirrup-iron, resembling the semi-circular handle of a pot, and which is alleged to have belonged to William Rufus—a fact which it would be equally cruel and needless to dispute with its well-meaning and devoutly believing exhibitor.

But we must draw ourselves away from the lodge of the lord warden, or rather of his deputy's deputy, and be on our way westward by Brokenhurst. The chaise, with a pair of fresh horses, is again rolling along the trim pathway across the heathy patches, and amidst scattered groups of oak and birch plantations. Nowhere, it is to be observed, either in this part or farther eastward, do we see any actual forest. The New Forest, which includes nearly 100,000 acres of land, and originated in the reign of William I., about eight hundred years since, is in the present age only a woody piece of country, dotted over with enclosed farms, cottages, and gentlemen's residences, most of which private properties have in process of time been either given away by royal grants, or acquired on the principle that squatters take possession of lands in the backwoods of America. No doubt, this has constituted a serious grievance; but John Bull has suffered so many other losses of much greater consequence, that intrusion on the bounds of the New Forest escaped his attention until a recent period, when a better order of things was instituted. Royal grants of lands are now abolished, and squatting is no longer permitted.

Proceeding through Brokenhurst, a village of Saxon origin, mentioned in that venerable chronicle Doomsday Book, we attain some grand forest views, over a wide range of greenwood, and open groves or glades, varied in many different forms; and immediately afterwards enter a vista, or avenue of several miles in length, perfectly straight, and lined on each side with a row of tall trees. This formal pathway conducts us almost to Lymington, which is the termination of our journey on the mainland. Lymington is a dull country town of no note, situated on the face of an eminence which declines towards a muddy creek, containing sufficient water to float the two or three small trading craft and a steam-boat, that draw up alongside its quay. Looking southwards down the creek, we perceive the Isle of Wight at about two or three miles' distance from its outer extremity. The steam is up. All things are ready, and we are off on our voyage through the winding water of the swamp, and thence across the narrow channel beyond. In forty minutes, we are landed at Yarmouth.

The channel between the mainland of Hampshire and the Isle of Wight, anciently called the Solvent, and now the Solent Sea, varies in breadth from two to five miles, and is understood to have been formed by the breaking of the ocean across a tract of land at the spot. The island thus separated must originally have been of much greater extent than at present, because it is daily diminishing by the action of the sea on its southern and western shores. It now measures twenty-two miles from east to west, and at the middle thirteen from north to south. By the Romans it was called Vecha or Vectis, which has been corrupted in modern times into Wight. On the side next the Solent, the land slopes gradually to the water's edge, and possesses no point of the least interest. The only parts of the island attractive by their picturesque appearance, are the western and southern coasts, for there the encroachments of the ocean have produced a series of chalky precipices, which frequently alter in extent and character, and form a valuable study to the geological tourist.

After a night's residence in the little old-fashioned town of Yarmouth, we proceeded in an open car to explore the western extremity of the island, at the far-famed Alum Bay. A drive of five or six miles, over a circuitous and gradually ascending road, prettily lined with hedge-rows, brought us to the top of a heathy hill, from which it was found necessary to clamber down to the sea-shore. This point is at length gained, and affords a striking marine view. Before us is the wide placid sea, with the Isle of Portland, on the coast of Dorsetshire, faintly visible in the distance. Near us, but within the line of the water, are several columnar masses of rock, called the Needles, which have been left by the encroachments of the waves on the solid land. The shore is wide, flat, and composed of exquisitely fine sand, of divers colours, stretching to the base of lofty cliffs behind us. These cliffs are generally composed of a softish chalk, enclosing lumps of flint; but in some places the material is varied with stripes of a red and blue colour. In many parts the incumbent mass rests on a stratum of gravel, or other friable sandy matter; and this inferior layer being daily operated upon with more or less violence by the sea, huge cliffs are undermined, and either slide down with a portion of hill behind, in the form of land-slips, or tumble in fragments upon the beach. The white sand of the shore is esteemed of value for the manufacture of glass and earthenware, and forms an important article of export. The more bright and various coloured sands are also removed in smaller quantities to form ornaments for chimney-pieces, by putting them in phials in a particularly tasteful style of art, so as to represent fanciful scenes beneath the surface of the glass.

From Alum Bay we retraced our steps for a mile or two eastward, and then struck off towards the southern shore at Fresh-water Gate, a place consisting of only a boarding-house and two or three cottages. A similar scene of white chalky cliffs, worn in some places into yawning caverns, here awaited us; and having noted all that was worth inspection, we drove off to Newport, a distance of ten miles, and situated near the centre of the island, of which it is the metropolis.

Newport, in my opinion, is the prettiest place in the island. It is a neat brick town, with several good streets laid out at right angles to each other, or radiating from the main thoroughfares into pleasant country roads around. The town occupies the flat bosom of a valley, on the banks of a small river called the Medina, which issues into the sea at Cowes, and on nearly all sides is surrounded by low rounded hills, the most attractive of which is one on the west, forming the site of the aged castle of Carisbrooke. It would be unpardonable for any one to be an hour in Newport, without proceeding to view this deeply interesting spot. In our case, the evening was one of the finest that could be selected for such an excursion, and we lost no time in making our way thither. An easy walk of half an hour, along a pleasant road, brings us to the bottom of the hill, and, ascending that green eminence by flights of steps and pathways, we are shortly on a flat esplanade, level with the exterior ramparts of the castle. A few minutes more, with the porter's permission, allow us to enter the huge machicolated gateway, to cross the inner courtyard, and to ascend to the summit of the ponderous Norman keep. What a scene meets our eye! We are from three to four hundred feet above the level of the sweet valley beneath, in which nestle the old village and church of Carisbrooke, with rich environing gardens, and a few gentlemen's villas. Looking a little to the east and northward, we see Newport stretching along the Medina, and retiring amongst lines of leafy trees and thorn hedge-rows in full blossom. Beyond to the northward, our vision is extended over a bushy upland, called the Forest of Parkhurst; and still farther off, in the same direction, we have a glimpse of the

Digitized by Google

Solent in the vicinity of Cowes. Southward, the scene is limited to the face of the enclosed fields which descend from the higher downs between us and the coast. A more charming, soft, simple prospect, calling up ideas of peaceful quiet, industry, and comfort, can scarcely be pictured in the imagination. The ruins of the old castle, on which we have taken our seat, and lighted up with the mellow tinge of an evening sun, help to awake additional fancies in the mind. We have the wide expanse of the fortification before us, covering at least twenty acres of ground, and plainly showing what an important feudal stronghold the place once had been. The whole is now completely dismantled, and in a state of broken ivy-clad ruin, with the exception of the house and offices, of comparatively modern date, belonging to the keeper, in the inner court. Descending the broken stair of the keep to these offices, we are conducted into one in which is a draw-well of 300 feet in depth. Water is drawn from it by a bucket and windlass, wrought by an unfortunate donkey, who is obliged to enter and turn round a wheel, on the principle of a squirrel in a cage. This poor creature, who, on performing his task, was glad to scramble out, and betake himself to a nibble of the green grass which grows plenteously in the court-yard, was, it seems, preceded in office by an ass who worked the wheel for the space of fifty-two years, and even then died in perfect health and strength, by accidentally falling over the ramparts of the castle. One of its successors was a pensioner of the Duke of Gloucester, uncle of George III., who settled on it an aliment of a penny loaf a-day; a bounty which it gratefully enjoyed for a long period of years. The water of the well, which was brought up for us to taste, is pure, cool, and pleasant, being the produce of springs in the solid rock.

On the northern side of the court, near the keeper's house, are the dilapidated walls of the edifice in which Charles I. was confined, after he had fallen into the hands of his subjects. The window, with its iron bars, through which he on one occasion attempted to escape, is still pointed out: the apartment is entirely gone. A not less interesting spot is the open tilting ground on the east, and exterior to the court-yard. This ancient place of arms is a beautiful lawn, with banks on all sides for spectators, the whole being in as good preservation as when filled with the chivalry and fair daughters of Vectis.

The broad green knoll on which the castle stands, has been the site of a fortification since the period the Romans were in possession of the island, and has been maintained by successive dynasties of Saxons, Normans, and English. In the year 530, the castle was captured by Whitgar, a general under Cerdic, king of the West Saxons, and hence received the name of Whitgarsburg, which was afterwards shortened into Garsbruk, and that, in its turn, was transformed into the present appellation of Carisbrooke. The village which arose at the base of the mount, was, in these ancient times, the capital of the island, but in the course of events it gradually lost this character, and the rise of Newport, in a more advantageous situation farther down the Medina, finally deprived it of its distinction and importance. Newport, in the present day, as I have said, is a remarkably neat town, with evidently a fair share of trade, and is the place of residence of many respectable families. During our stay, we made excursions to several places in the neighbourhood besides Carisbrooke; among the rest, to the government prison at Parkhurst, to see which had been a principal motive for my visit to this part of England. An account of what fell under my observation here, will form the subject of the next article.

Having thus fairly exhausted Newport and its neighbourhood, we proceeded southwards, on a more lengthened excursion, to follow out the line of coast from Blackgang Chine to Shanklin. This division of the southern shore comprises scenery more interesting than what is seen farther west at Freshwater Gate and Alum Bay. The incessant action of the waves of the British Channel is here producing the usual effects of high bare cliffs and formidable land-slips, down to the verge of the water. For a distance of about five miles, there is a section of the coast, called Undercliff, which presents a very peculiar appearance. The washing away of the substratum on the shore, has caused the face of the hill all along to slide down in disorderly masses to the shore, but preserving a verdant and shrubby surface, and leaving the remaining half of the hill to form a bold, precipitous, and naked background. A road winds along on the top of the fallen land; and here also, in this somewhat perilous situation, are built, in various delightful sunny nooks and on prominent bushy knolls, ornamental cottages and houses; and in one place, under the shadow of the pendant cliff, there is now building a handsome town of detached villas, called Ventnor. The friable sandstone cliffs near Blackgang abound in marine fossil remains. From a mass of rock which had fallen from the summit, a height of about three hundred feet above the level of the sea, I procured some remarkably fine specimens of fossil shells of different kinds. The millions of years that must have elapsed since the sandstone of the cliff was a soft mass in the bed of the ocean, who can number or imagine!

Pursuing the winding and up-and-down route beneath the crags on our left, with the glittering expanse of the channel on our right, we are at length brought to Shanklin, a modern village a short way removed from the sea, and celebrated for its *chine*. Chine is a word often heard in the Isle of Wight, and applies to a ravine of sandy strata of different colours. The chine at Shanklin, I understand, was once pretty; now, it is a dell with dirty brown sandy sides, not more interesting than a tolerably deep railway cutting, its variegated colours, if they ever existed, having been obliterated by damp, or a muddy stream conveyed into it from the village.

From Shanklin, a journey of an hour brings us to Ryde, at the eastern extremity of the island. Ryde is a town of beautiful villas, with some business streets, lying on the face of a pleasant woody hill, and commanding a view of Portsmouth on the mainland opposite. The town is provided with a very long wooden jetty or pier across a wide expanse of sandy beach, which is visible at low water; and hence steamboats ply at frequent intervals, in connexion with Portsmouth, Southampton, and various other places.

The Isle of Wight, of which we now had made a pretty comprehensive inspection, both in the interior and coasts, possesses a few interesting points worthy of the visit of tourists, particularly Alum Bay, Undercliff, and Carisbrooke; but, generally speaking, its natural beauties and fertile qualities have been considerably overrated. Most of it is of a commonplace character, consisting of low bare hills or downs, with the inferior slopes disposed as small arable farms; and it possesses little ornamental wood to compose what is called park scenery. The soil is generally a poor yellowish clay, in many places ill-drained, and under a backward state of cultivation. I understand, however, that the more energetic landed gentry and yeomanry are making efforts to improve both the tillage and the live stock of the island. The roads are good, though very narrow and uneven; and being environed by hedge-rows, they form one of the most pleasing traits in the rural scenery. The climate of the island is usually reckoned to be somewhat more mild, pure, and salubrious than that of the mainland of England; except, however, as respects a temperature two or three degrees higher in winter, from the prevalence of marine breezes, I should imagine this distinction to be rather fanciful. The island contains many remarkably pleasant places of private residence for invalids and others, and also a plentiful supply of hotels for transient visiters; but there are several drawbacks on comfort which it may be as well to state. In few places are there any walks on a level surface fit for valetudinarians—scarcely any conveyances are to be obtained but open cars—and the expense of living at boarding-houses or inns is excessively high. A tourist may travel a month in some parts of the Continent for the sum which he will be compelled to dissipate in a week in the Isle of Wight. The same thing almost may be said of travelling in any part of the south of England.

The island is evidently a place of permanent residence for many families in retired life and easy circumstances, the number of this class of its inhabitants having greatly increased within the last twenty or thirty years. The population is now about 40,000, nearly a fourth part of whom belong to Newport, and another fourth to Ryde and Cowes. The latter town, at the mouth of the Medina, directly opposite the estuary of Southampton water, is the principal seaport, and seat of a rather distinguished and numerous yacht club. The island possesses a governor, vice-admiral, and other honorary functionaries; the present vice-admiral is the Earl of Yarborough, whose elegant mansion of Appuldurcombe, which is kindly thrown open on certain days of the week for the inspection of visiters, forms a leading attraction in the southern part of the island.

Attending with some degree of care to its internal arrangements, and being of easily manageable dimensions, the Isle of Wight may be described as in a generally thriving and comfortable condition. You nowhere see any mendicant vagrancy or external marks of destitution. This gratifying state of affairs is promoted by a strict exclusion of all persons likely to be a burden on society. Placards on the walls denounce severe penalties on all "beggars, pretended matchsellers, exhibitors of white mice, or wandering musicians," who are found within the limits of the island, and captains of vessels are warned not to bring them over. But other and more effectual means are adopted for extirpating poverty. The whole island, as respects pauperism, is reckoned as one parish, and is provided with a large workhouse for the reception of all paupers whatsoever, situated a short way from Newport. While furnishing a tranquil shelter to the infirm and helpless poor, this house of industry gives employment at out or in-door labour to all who are able to work, and choose to remain within the establishment; and to the juvenile poor it affords instruction, and fits them for a useful trade or occupation in the world. Eighty acres of land are attached to the house, and divided into fields and gardens which are cultivated by the inmates. The institution has proved an effective cure of utter destitution and misery.

MACONOCHIE ON THE CONVICT SYSTEM IN AUSTRALIA.

Captain Maconochie, a person of enlightened and generous character, well known to men of science in this country, about five years ago accompanied his friend Sir John Ross to Van Diemen's Land, in the capacity of secretary, but was soon obliged, by the individuals who had long held the chief influence in the colony, to retire from a situation in which he could not look with official indifference upon almost every species of selfish injustice. Fortunately, the home government appreciated his value, and three papers drawn up by him, on the convict discipline of the Australian colonies, were laid before Parliament in April 1838. Captain Maconochie has more recently in Van Diemen's Land printed a volume,* in which, besides a summary of those parliamentary papers, he presents a series of short articles on various connected subjects, all of them marked by enlarged and humane views. The object of the whole is to enforce the propriety of substituting for the present harsh and degrading mode of convict management, a system in which, while punishment is duly administered, moral influence shall be called into play for the purpose of producing reformation.

Captain Maconochie's account of the present system, and of the evils flowing from it, is very striking.

"Prisoners are, on their first arrival in the penal colonies, assigned to private service at the will of a public board, which endeavours, as it best can, to distribute them fairly and equally among the settlers, according to certain conventional rules laid down for its guidance. In the assigned service thus entered on, no wages are allowed to be given; nor is any other *moral* impulse employed, excepting the remote hope of indulgence after four, six, or eight years, according to their original sentence. Until these elapse, the labour imposed is strictly *coerced*, or *slave* labour; and although accompanied with a fixed *minimum* amount of physical maintenance and support, sufficient to place above want, it is yet subject to all the discomfort and moral degradation incident to such a condition. The men are lodged in outhouses, six, eight, or more, under a stable roof; they sleep here on trundle bedsteads, generally without undressing; the floor is earthen, and often very soft; they cook and eat in the same place, or in one not better, immediately adjoining, always in the roughest manner; and they are subject to the most severe regulations, which any master can get enforced, on appeal to a magistrate, by equally severe punishments. This is the usual picture in the country districts; in the towns there is more comfort (sometimes in the case of a good house-servant there is even too much, consistently with a state of punishment), but there is much more temptation. Not being allowed wages, yet desirous of procuring indulgences, the prisoners too often steal to obtain means; and all fly to liquor, whenever they can obtain it, to drown humiliation and care.

At the end of the several allotted periods each man may ask for, and, according to the report made of him, may obtain, or be refused, a ticket of leave; but in this there is necessarily much uncertainty. The record kept of prisoners' conduct only embraces offences, no official notice being taken of good ordinary behaviour, as diligence, sobriety, obedience, honesty, fidelity, zeal, or the like; and thus, as only that appears which has drawn down magisterial censure, a careless fellow, however good his disposition and intentions, especially if he has had an indifferent master, may have a long list against him, while a thorough villain, more happily circumstanced, or perhaps from the very power of deception which his practice in villany gives him, may have few or none. When the ticket is obtained, a particular district is assigned, in which the recipient must reside. Within it he may choose his master and residence, and receive wages; but under a recent statute, he is not allowed to acquire property. He must attend frequent musters, and may not change his residence without informing the police. He must also constantly sleep at home, and return thither before eight o'clock every evening. For very trifling irregularities he is liable to have his ticket suspended, or entirely taken away; in either of which cases he is usually sent to hard labour in a road-party, thus falling back on the worst, and not on the best, form of previous treatment. And, practically, a very large proportion of ticket-of-leave men are thus interrupted, often on very slight occasions, in their labour and pursuits, even in this their comparatively free position.

As the periods of sentence respectively expire, with or without having obtained tickets of leave, and however abandoned in character (if only they escape an extension of time under a colonial sentence), the prisoners become entirely free, and mix as such with the remainder of society; of which whole system the minute features and consequences may be thus classed:—

The degree of punishment inflicted by it is in every

* Australiana. Thoughts on Convict Management and other Subjects connected with the Australian Penal Colonies. By Captain Maconochie, R. N. K.H. London: J. W. Parker. 1839.

Digitized by Google

case quite uncertain. A bad master may make it fearful; a good or weak one may greatly mitigate it. Much also depends on the personal character of the criminal himself, as will be presently explained; but, in general, the amount of suffering is much greater than it appears to be, or than it is thought in England, or than is at all proportionate to minor offences.

It is on the persons guilty of these, at the same time, and even on the most innocent of them, that the punishment chiefly falls; for the *physical* endurance *is* trifling compared with the *degradation*, and other *moral* suffering inflicted; and it is the best men who feel these most acutely. The previous habits of old offenders may in most cases, even before their arrival, have inured them to filth, slovenliness, suspicion, contempt, and the habit of submitting to, and commanding their tempers under, such treatment; while a comparatively good man writhes under every thing approaching to indignity, and is unable to conceal or restrain the feelings excited by it.

The very bad are thus little punished—if, indeed, their situation be not in many cases even improved; while the less bad, up even to the very good (of whom there are some), are punished with extreme severity, and almost universally degraded and demoralised. Every feeling of self-respect is speedily lost amidst the humiliations and inconveniences inflicted; and irritation, recklessness, insubordination, disgraceful punishment, furious resentment, drunkenness, theft, and prostitution, complete the sacrifice of many a human being born to better things, and whom misfortune and imperfect political institutions, more than crime, or original bad dispositions, have thus irrecoverably ruined.

The evil also does not stop here. Social, like mechanical impulses, act reciprocally. The degradation of one class operates injuriously on every other; and it is impossible to view the state of society in the penal colonies, without being made most painfully sensible of this fact." Our author traces the effect of this slave-holding system in the harsh, overbearing, and quarrelsome character which attaches to the free population of penal Australia; in a depth of suspicion, and a recklessness of assertion "beyond all precedent in civilised life;" in short, "a diremion of society." Under a system so unfortunately arranged, administration becomes extremely difficult, and every successive governor has been charged with heinous errors.

Captain Maconochie proceeds to suggest a new system of management for the convicts in Australia. He proposes that they should be kept entirely under the care of the government, and subjected to a well-regulated system of restraint and of reformation, until they have become fit to re-enter society, when they should come forth as free labourers. Into the details of his plan we cannot here enter; but it is the less necessary, as, since the preceding part of this article was put into types, the subject has come under discussion in parliament, and a prospect has been held out of a complete revolution in convict management being carried into effect by the government. The subject is one invested with great difficulties. It will be scarcely possible so to adjust the meed of punishment, the means of reformation, the desirableness of economy, the demands of one set of the colonies for convict labour, and the fears of another set lest convicts be let loose upon them, as to give entire satisfaction. But it is quite clear that some change in the present system is required; and hence we would hope that the various parties interested in the question will meet it in a spirit of liberality and concession, and not allow small obstacles to stand in the way of a reform so devoutly to be wished.

EXPEDITION TO SIBERIA.*

THE recently published work, of which the full title is noted below, is one of much importance in various respects. No portion of the globe, scarcely excepting even the interior of Africa, is less known to the civilised world than the northern coast of Asia. This region being entirely in the possession of Russia, it was by that power alone that discoveries could properly be prosecuted; and, till of late years, its rulers have not been in a condition to appreciate the full value of such explorations, either to themselves or to mankind at large. The matters brought to light, therefore, by Admiral Wrangell's expedition of 1820–1823, the account of which is now for the first time laid before the world, have all the charm of perfect novelty; and of this, as well as of their generally interesting character, a few extracts will suffice to satisfy the reader.

The north-eastern district of Siberia, visited by Admiral Wrangell and his companions, lies between the river Lena on the west, and Behring's Straits on the east, and extends from about the 126th to the 190th degree of east longitude, and from the 62d to the 73d degree of north latitude. The expedition was a land one, its main object being to settle certain doubts which prevailed as to the existence of a great arctic continent north of the Siberian seas. An extensive tract of the Siberian coast was traversed by the party in the course of their enterprise, in order to enable them to cross the ice northwards, at various points, in sledges; and the result of these journeys was the discovery of a "wide immeasurable ocean," at all the points which they tried. This obstacle of course compelled them to pause, and renounce the object immediately in view. But in their various routes on the land, they saw enough to render their expedition one of profound interest, both to themselves and to others. The little that was formerly known on the subject of Northern Siberia, must have often led reflecting minds to wonder in what manner life could be sustained in regions so cold and dreary. "Here (says Admiral Wrangell) there is nothing to invite. Endless snows and ice-covered rocks bound the horizon. Nature lies shrouded in almost perpetual winter. No one attempts the cultivation of any *vegetable*, nor could success be expected." This must be understood as referring to the vegetables capable of sustaining man, and which, indeed, do yield his chief sustenance in almost all parts of the world. Happily, however, there are in Siberia grasses and wild fruits, in sufficient abundance to maintain a great variety of the lower animals; and it is here that nature has given compensation to man for the poverty of useful vegetation. "Countless herds of rein-deer, elks, black bears, foxes, sables, and grey squirrels, fill the upland forests; stone foxes and wolves roam over the low grounds. Enormous flights of swans, geese, and ducks, arrive in spring, and seek deserts where they may moult and build their nests in safety. Eagles, owls, and gulls, pursue their prey along the sea-coast; ptarmigan run in troops among the bushes; little snipes are busy along the brooks and in the morasses; the social crows seek the neighbourhood of men's habitations; and, when the sun shines in spring, one may even sometimes hear the cheerful note of the finch, and in autumn, that of the thrush." There is also an abundance of fish in the waters; and it is by means of these varieties of animal life that a comparatively large population are fed and clothed, and enabled to endure the cold and herbless dreariness of a Siberian clime.

As in the case of the Laplanders, the rein-deer furnishes to the nomade tribes of Siberia the means of supplying all their most pressing wants. "The two most important epochs of the year, are the spring and autumn migrations of the rein-deer. About the end of May they leave the forests, where they had found some degree of shelter from the winter cold, in large herds, and seek the northern plains nearer the sea, partly for the sake of the better pasture afforded by the moss tundras, and partly to fly from the mosquitoes and other insects, which, literally speaking, torment them to death.

In good years, the migrating body of rein-deer consists of many thousands; and, though they are divided into herds of two or three hundred each, yet the herds keep so near together as to form only one immense mass, which is sometimes from fifty to one hundred versts in breadth. As each separate herd approaches the river, the deer draw more closely together, and the largest and strongest takes the lead. He advances, closely followed by a few of the others, with head erect, and apparently intent on examining the locality. When he has satisfied himself, he enters the river, the rest of the herd crowd after him, and in a few minutes the surface is covered with them.

Then the hunters, who had been concealed to leeward, rush in their light canoes from their hiding-places, surround the deer, and delay their passage, whilst two or three chosen men, armed with short spears, dash into the middle of the herd, and dispatch large numbers in an incredibly short time; or at least wound them so, that if they reach the bank, it is easy to fall into the hands of the women and children.

The office of the spearman is a very dangerous one. It is no easy thing to keep the light boat afloat among the dense crowd of the swimming deer, which, moreover, make considerable resistance; the males with their horns, teeth, and hind-legs, whilst the females try to overset the boat by getting their fore-feet over the gunnel; if they succeed in this, the hunter is lost, for it is hardly possible that he should extricate himself from the throng; but the skill of these people is so great, that accidents very rarely occur. A good hunter may kill one hundred or more in less than half an hour. When the herd is large, and gets into disorder, it often happens that their antlers become entangled with each other; they are then unable to defend themselves, and the business is much easier. Meanwhile, the rest of the boats pick up the skins, and fasten them together with thongs, and every one is allowed to keep what he lays hold of in this manner. It might seem that in this way nothing would be left to requite the spearmen for their skill, and the danger they have encountered; but whilst every thing taken in the river is the property of whoever secures it, the wounded animals which reach the bank before they fall, belong to the spearman who wounded them. The skill and experience of these men are such, that in the thickest of the conflict, when every energy is taxed to the uttermost, and their life is every moment at stake, they have sufficient presence of mind to contrive to measure the force of their blows so as to kill the smallest animals outright, but only to wound the larger and finer ones, so that they may be just able to reach the bank. Such proceeding is not sanctioned by the general voice, but it seems, nevertheless, to be almost always practised.

The whole scene is of a most singular and curious character, and quite indescribable. The throng of thousands of swimming rein-deer, the sound produced by the striking together of their antlers, the swift canoes dashing in amongst them, the terror of the frightened animals, the danger of the huntsmen, the shouts of warning, advice, or applause from their friends, the blood-stained water, and all the accompanying circumstances, form a whole which no one can picture to himself without having witnessed the scene."

Sometimes the rein-deer hunt fails, and then the importance of the animal to the natives is shown by the most deplorable consequences. On one occasion, when Admiral Wrangell was present, the natives, who were waiting in a state of almost utter starvation for the appearance of the herds, "were filled with joy, by immense numbers of rein-deer approaching the right bank of the river opposite to Lobasmoje. I never saw such a multitude of these animals. At a distance, their antlers resembled a moving forest. Crowds of people flocked in on every side, and hope beamed on every countenance as they arranged themselves in their light boats to await the passage of the deer. But whether the animals had seen and were terrified at the crowds of people, or whatever the reason may have been, after a short pause, they turned, left the bank, and disappeared among the mountains. The utter despair of the poor starving people was dreadful to witness. It manifested itself among these rude children of nature under various forms. Some wept aloud, and wrung their hands; some threw themselves on the ground, and tore up the snow; others, and amongst these the more aged, stood silent and motionless, gazing with fixed and tearless eyes in the direction where their hopes had vanished. Feeling our utter inability to offer any alleviation to their misery, we hastened to quit this scene of woe."

The inhabitants of Siberia, in fact, enjoy life but by fits and starts. The rein-deer, it has been seen, appear but at certain seasons, and the case is the same with fish. During the intense winter cold, these creatures retire into the deepest parts of the rivers and lakes, and are there unapproachable. When their stores of flesh and fish chance to run short, which often happens before the fitting time, the distress of the people becomes altogether fearful. "One sees them, like wandering phantoms, pale, without strength, scarcely able to walk; they throw themselves greedily on any remains of bones, skin, or aught else which may in any way alleviate the pangs of hunger." The common form in which they usually first obtain relief, is by the arrival of large flights of birds, swans, geese, ducks, and snipes, from the south. Old and young, men and women, all who can use a gun or a bow, hasten to the pursuit, and, for the time, the scarcity ends. When to these frequent sufferings from famine is added an atmospherical temperature, considered mild when *only* eighteen or twenty degrees below the freezing point, and when it is remembered that innumerable hosts of sharp-stinging mosquitoes fill the air during a great part of the year, it may well be believed that the people of these regions are characterised by continued melancholy, if not by sullen moroseness.

Having usually to shift in the fishing season to the banks of rivers, many of the Siberian tribes occupy two kinds of habitations, their winter and their summer ones. The former are small cottages of boards, in the shape of truncated pyramids, with sunk mud floors, and window-slits fitted with plates of ice in winter, and fish-membranes at other times. The summer dwellings are tents of birch bark, softened and sewed together. An open hearth, with a very rude chimney, keeps these huts well furnished with smoke, which is essential to the expulsion of mosquitoes. Of the fisheries conducted at the summer tents, it is only necessary to remark, that the whole of each little community unites to erect a dam across the river, leaving an opening in the middle in which baskets are placed for the securing of the migrating fish. After the construction of the dam, the fishing is a task so easy, that the men hand it over to the women, and direct their own attention to the chase.

The Siberians of the north-east, called by the tribe-names of Tungusi, Jakuti, Lamuti, and others, have, in addition to their tame rein-deer, a small-sized, shaggy breed of horses for work and travel. But, like the Kamtschatkadales, the inhabitants of many districts also possess a peculiar and powerful breed of dogs, by means of which a great part of their sledge-journeying is effected. "These dogs," says Admiral Wrangell, "have much resemblance to the wolf. They have long, pointed, projecting noses, sharp and upright ears, and a long bushy tail; some have smooth, and some have curly hair; their colour is various, black, brown, reddish-brown, white, and spotted. They vary also in size; but it is considered that a good sledge dog should not be less than two feet seven and a half inches in height, and three feet three quarters of an inch in length (English measure).

Their barking is like the howling of a wolf. They pass their whole life in the open air; in summer they dig holes in the ground for coolness, or lie in the water to avoid the mosquitoes: in winter they protect themselves by burrowing in the snow, and lie curled up, with their noses covered by their bushy tails. The female puppies are drowned, except enough to preserve the breed, the males alone being used in draught. Those born in winter enter on their training the following autumn, but are not used in long journeys until the third year. The feeding and training is a particular art, and much skill is required in driving and

* Narrative of an Expedition to the Polar Sea in 1820, 1821, 1822, and 1823, by Lieutenant (now Admiral) Wrangell of the Russian Imperial Navy. Edited by Major E. Sabine. London: James Madden and Co. 1840.
